The engineering of a water supply system for the Wintergreen Ski Resort atop the Appalachian Mountains of Virginia is described. The 2,150 feet of static lift from Lake Monocan, the nearest possible water source, to the mountain storage tank is spread over distinctly different mountain and valley segments. Maximum continuous demands over the winter may reach 1,400 gpm or 2 mgd. Several high pressure pump systems were evaluated in the design stage, and the system chosen for use involved a Lake Monocan pump station, a valley pipeline (17,000 feet), Peggy's Pinch pump station, a mountain pipeline (7,650 feet), and a mountain storage tank (250,000 gallons). The lake pumping station may be relocated if the lake is enlarged. The Peggy's Pinch station has two 700-gpm pumps with controls and welded steel piping that conforms to standards required in petroleum transport. To account for pressure rise due to instantaneous closures (water hammer) several surge protection devices were installed with automatic check valves. Spherical shock traps which were designed for data based on computer simulations of the worst possible water hammer situtation were also installed. Selection of pressure piping based on the hoop stress formula resulted in the use of ASTM A53 or API 5L, Grade B pipe with a yield strength of 35,000 psi. The mountain top reservoir serves the snow making machinery and golf course irrigation system and supplements domestic use when demand exceeds capacity of existing wells. The system has been operating since the 1974-75 ski season with essentially zero down time. (Geiger-FRC)

RETENTION BASINS: KEY TO STORM DRAINAGE PLAN,
Barrett, Harris, and Associates, Inc., Menlo Park, CA.
F. H. Barrett, Jr., and A. Petrie.
Public Works, Vol 111, No 3, p 67-70, March, 1980. 2 Fig, 2 Tab.

Descriptors: *Retention, *Storm runoff, *Basins, *Water storage, Urban drainage, Storm drains, Planning, Water management, California, Watersheds, Recreation, Project feasibility, Economics, Design criteria, Flood control, *Manteca(CA).

Reevaluation of the Manteca, California storm drainage fee structure in 1974 revealed that surface runoff discharge facilities were inadequate to handle storm conditions. Of the options available to correct the situation, the most practical in terms of costs and legal considerations was the construction of a system of retention basins. Design criteria were based on occurrence of an intense storm every 5 years, and peak unit flow calculations were estimated from land use, tributary area and total peak flows. Retention basins applicable to the study area which were examined included those with total gravity flow, those requiring pumping at inlet only, and those necessitating pumping only at the outlet. Different variables are considered which would influence the design of a basin. The drainage facility may be used for recreation nearly 80% of the time in most areas in California; safety and maintenance factors accompanying this dual use are discussed. A non-pumping drainage plan is usually favored. Since the original master drainage plan was completed in 1974, Manteca has completed 3 successful retention basins. Percolation basins may be feasible for recharging groundwater supplies in other areas where the water table is lower. Financial aspects of the storm drainage master plan were reviewed from the viewpoint of the residents, developers, and cities planning and managing committees. (Geiger-FRC)

DEFLECTION MECHANISM OF PVC SEWER PIPE,
Uni-Bell Plastic Pipe Association, Dallas, TX.
W. D. Nesbeitt, and R. T. Walker.
Public Works, Vol 111, No 3, p 79-83, March, 1980. 5 Fig.

Descriptors: *Flexibility, *Plastic pipes, Defection, Sewers, Piping systems, Pipes, *Pipelines, Engineering structures, Soil mechanics, Rigid foundations, Flexible foundations.

The deflection mechanism and uses of flexible polyvinyl chloride (PVC) sewer pipes are discussed. The engineering profession has long recognized the good long-term performance of PVC buried pipe. As flexible pipe defects, the vertical force vectors derived from the load (soil weight, superimposed dead load or superimposed live load) are distributed effectively through the defection mechanism into the surrounding embedment soil. The effects of soil arching and negative soil arching are outlined for both rigid and flexible pipes. For flexible pipes, the Marston formulas for calculating loads imposed on buried pipes are valid for narrow trench conditions. Research on the relationship between contact pressure and pipe flexibility has shown that the effective force vector distribution can provide substantial benefits when pipes of sufficient flexibility are premitted to deflect under load. The critical performance limits for different flexible pipe products have been defined in terms of their percent deflection. PVC sewer pipe (ASTM D 3034 DR 35) will not fail at a deflection equal to or less than 30% with a safety limit of 7.5%. Satisfactory operations of PVC pipe have been recorded for North American and some sites in Europe. Trial ASTM D 3034 DR 35 pipelines installed in the difficult soil conditions of the Netherlands are providing good long-term structural strength. (Geiger-FRC)
W81-01639

AUSTIN'S INTERCEPTOR AND TREATMENT PLANT: ENGINEERING WONDER,
Water and Waste Water Dept., Austin, TX.
C. E. Johnson.
Public Works, Vol 111, No 4, p 69-73, April, 1980. 1 Fig.

Descriptors: *Sewage treatment, Tunnels, *Waste water treatment, *Treatment facilities, Discharge lines, *Austin(TX), Texas, Colorado River, *Design criteria, Urban development, Filtration, Odor, Sludge treatment, Industrial wastes, Costs, Instrumentation, Grants.

The interceptor tunnel of Austin, Texas and its main treatment facility, the Govalle plant, are described. The tunnel, which was designed to service population expansion into the northwest and east sectors of the city, was completed in 1975, and its discharge facility, the Walnut Creek treatment plant, in 1977. The tunnel operates by gravity flow and is 11 miles long with a 7-8 foot diameter. A

backwashing system was installed to assure a flushing velocity in the tunnel. Air louvers were provided at the inlets to control odors and keep the entire system aerobic. Metering devices allow diversion of flows to either the Govalle or Walnut Creek plant to evenly distribute treatment loads. Equalization basins double as primary clarifiers to give storm flows (up to 76 mgd) at least primary treatment and chlorination. Austin has placed limitations on all industrial and some municipal discharges into the sewer system. The waste water treatment plant was designed to be aesthetically pleasing to nearby residents. The treatment cycle now includes screening, grit removal, primary settling, flow equalization, activated sludge treatment, chlorination, and effluent filtration. Effluent filtration is accomplished by dual media gravity filters. Sludge is thickened at the Walnut Creek site and pumped to lagoons on the Colorado River seven miles away. Air filtration is carried out with granulated carbon absorbers to control odors. Delays in planning and construction occurred due to transitions in Federal grant programs. The costs for the interceptor tunnel and new treatment plant were $21 and $35.2 million, respectively. (Geiger-FRC)

8B. Hydraulics

MEASUREMENTS IN MERGING FLOW,
Illinois Univ. at Urbana-Champaign. Dept. of Civil Engineering.
W. H. C. Maxwell, and A. Snorrason.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-163545, Price codes: A03 in paper copy, A01 in microfiche. Water Resources Center, University of Illinois, Research Report No 155, January, 1981. 38 p, 17 Fig, 2 Tab, 44 Ref. OWRT-A-103-ILL(1), 14-34-0001-0115.

Descriptors: *Diffusion-flow, *Flow characteristics, *Flow profiles, *Fluid mechanics, Jets, Mixing, Velocity, Turbulent flow, Testing procedures, Submerged turbulent jets, Merging flow, Reverse flow.

Previous measurements of the velocity field in the vicinity of two intersecting submerged turbulent jets provided evidence that, contrary to the usual assumptions, intersecting flows may not necessarily be combined using vector addition of velocities or momentum flux densities. To gather additional experimental evidence on the details of the velocity field near the intersection of two submerged turbulent jets, this study measured time average velocity magnitudes and directions of two perpendicular intersecting axisymetric submerged turbulent incompressible air jets of approximately equal strength. Because of the need to detect reverse flows, a three-dimensional pilot-type probe was used. This could sense yaw and pitch angles as well as velocity magnitudes. Two sets of measurements were taken. The more detailed set was confined to the plane of the nozzles, the less detailed set obtained cross-sectional data at four stations, three of these being in the observed reverse flow. The data show that the reverse flow spreads much more rapidly perpendicular to the nozzle plane than in the nozzle plane, whereas the forward flow is fairly symmetric. Similarity profiles were found in both the forward and reverse flows. In the forward flow the distribution was essentially Gaussian. This was also true in the backward flow in the direction normal to the plane of the nozzles. In the plane of the nozzles the backward flow profiles were close to semi-elliptical or semi-circular, depending on the scales for plotting.

Sewage Farming in Iraq: A Potential Hazard for Pollution,
W81-01528 3C

An Evaluation of Differential Pulse Anodic Stripping Voltammetry at a Rotating Glassy Carbon Electrode for the Determination of Cadmium, Copper, Lead and Zinc in Antarctic Snow Samples,
W81-01612 5A

PATHOGENIC BACTERIA
A Survey of Pathogen Survival during Municipal Solid Waste and Manure Treatment Processes,
W81-01483 5B

PEAK DISCHARGE
Distribution-Free Methods for Estimating Flood and Streamflow Exceedance Probabilities by Correlation,
W81-01519 2E

PERIOD OF GROWTH
Correlation of Seasonal Variations in Phosphorous and Nitrogen Species in Upper Black Warrior River With Duckweed,
W81-01428 5C

PESTICIDE DRIFT
An Evaluation of Nonpoint Sources of Pesticide Pollution in Runoff,
W81-01474 5B

PESTICIDE RESIDUES
Fate of Polychlorinated Biphenyls (PCBS) in Soil-Plant Systems,
W81-01475 5B

Quantitative Determination of Mirex and its Degradation Products by High-Resolution Capillary Gas Chromatography/Mass Spectrometry,
W81-01623 5A

PESTICIDES
Maximum Pesticide Concentrations in Agricultural Runoff: A Semiempirical Prediction Formula,
W81-01526 5B

Selected Organic Pesticides, Occurrence, Transformation, and Removal From Domestic Wastewater,
W81-01543 5D

PHENOLS
The Removal of Low Levels of Phenol by Activated Carbon in the Presence of Biological Activity,
W81-01492 5D

Determination of Traces of Phenol in Waters by Molecular Emission Cavity Analysis,
W81-01618 5A

PHILIPPINES
Breaking the Cost Barrier to Household Water Service,
W81-01548 6D

PHOSPHATES
Relationship Between Phosphate Stress, Effluent Quality, and Observed Cell Yield in a Pure-Oxygen Activated-Sludge Plant,
W81-01606 5D

PHOSPHORUS
Identification of a Dynamic Lake Model by the Group Method of Data Handling: An Application to Lake Ontario,
W81-01578 2H

Phosphorus in Suspended Sediments of the Amazon River,
W81-01583 5B

Contribution to the Study on Bottom Sediment in Lake Balaton. I. Determination of Phosphorus Minerals in the Sediment,
W81-01590 2J

PHOSPHORUS COMPOUNDS
On the Mechanism Reducing the Phosphate Concentration in the Water of Lake Balaton,
W81-01597 5C

Determination of Phosphorus in Waste-Waters by Inductively-Coupled Plasma Atomic Emission Spectrometry,
W81-01611 5A

PHOSPHORUS REMOVAL
Effectiveness of Land Application for Phosphorus Removal From Municipal Waste Water at Manteca, California,
W81-01551 5D

PHYSICOCHEMICAL PROPERTIES
Physical Chemistry of Virus Adsorption and Degradation on Inorganic Surfaces: Its Relation to Waste Water Treatment,
W81-01441 5B

PHYTOPLANKTON
Influence of Hydrological Factors on the Seasonal Abundance of Phytoplankton in Kinjhar Lake, Pakistan,
W81-01593 2H

PICLORAM
Picloram in Water and Soil from a Semiarid Pinyon-Juniper Watershed,
W81-01521 5A

SEDIMENTATION RATES
Ecological Studies on the Sudanese Nile System,
W81-01563 2E

Experiments on the Significance of Flocculation in the Settling of Fine-Grained Sediment in Still Water,
W81-01604 2J

SEDIMENTS
Installation for Treatment of Sediments Coming from Stations for Purification of Industrial Waste Water,
W81-01452 5E

Chemical Contaminants and Biological Abnormalities in Central and Southern Puget Sound,
W81-01479 5C

The Oxidation of Arsenite by Aquatic Sediments,
W81-01525 5B

Heavy Mineral Distribution in Bottom Sediments of the Bristol Channel, U.K.,
W81-01582 5B

Phosphorus in Suspended Sediments of the Amazon River,
W81-01583 5B

SELENIUM
Gas Chromatographic Method for the Determination of Selenite and Total Selenium in Sea Water,
W81-01615 5A

SEPARATION TECHNIQUES
Process for Separating Aqueous Mineral Acid Mixtures,
W81-01448 5D

Microscreen Method and Apparatus,
W81-01455 5D

Water Purification System,
W81-01460 5D

SEPTIC TANKS
Soil Potential Ratings for Septic Tank Absorption Fields in Leon County, Florida,
W81-01537 5B

SETO INLAND SEA (JAPAN)
Fish Population Dynamics under Nutrient Enrichment - A Case of the East Seto Inland Sea,
W81-01603 5C

SETTLING BASINS
Fine Solids Removal Following Combined Chemical-Trickling Filter Treatment,
W81-01436 5D

Economical Zero Discharge Achieved at Water Plant,
W81-01643 5F

SETTLING VELOCITY
Experiments on the Significance of Flocculation in the Settling of Fine-Grained Sediment in Still Water,
W81-01604 2J

SEWAGE BACTERIA
Sewage Farming in Iraq: A Potential Hazard for Pollution,
W81-01528 3C

Bacterial Supplementation Aids Waste Water Treatment,
W81-01638 5D

SEWAGE DISPOSAL
Effect of Sewage Effluent on Microbial Activities and Coliform Populations of Pahokee Muck,
W81-01529 5B

Soil Potential Ratings for Septic Tank Absorption Fields in Leon County, Florida,
W81-01537 5B

SEWAGE EFFLUENT
Effect of Sewage Effluent on Microbial Activities and Coliform Populations of Pahokee Muck,
W81-01529 5B

SEWAGE LAGOONS
Operational Experience with Aerated Lagoons,
W81-01645 5D

SEWAGE TREATMENT
Waste Water Treatment in the Mediterranean Zone: Study of Various Solutions Used on the French Coast. (Problemes Poses Par L'Epuration Des Eaux Residuaires Urbaines En Zone Mediterraneenne -- Etude De Diverses Solutions Appliquees Sur La Cote Francaise.),
W81-01472 5D

Seeking a Solution to Multiple Sewer Problems,
W81-01630 5D

Austin's Interceptor and Treatment Plant: Engineering Wonder,
W81-01641 8A

Operational Experience with Aerated Lagoons,
W81-01645 5D

SEWERS
Sewer Renovation--Solutions for the 80's.
W81-01559 5D

SHAGAWA LAKE (MN)
Ammonia Mineralization and Cycling in Shagawa Lake, Minnesota,
W81-01609 2H

SIERRA NEVADA
Sediment Loads From Headwaters of the East-Central Sierra Watersheds,
W81-01427 2J

SILVER IONS
Process and Apparatus for Treating Drinking Water,
W81-01458 5F

SLOPES
Modeling Groundwater Flow over Sloping Beds,
W81-01518 2F

SLUDGE
Codisposal of Municipal Solid Waste and Sludge.
W81-01634 5E

SLUDGE TREATMENT
Cost-Efficient Design Solves Town's Problem,
W81-01569 5D

SNOW
An Evaluation of Differential Pulse Anodic Stripping Voltammetry at a Rotating Glassy Carbon Electrode for the Determination of Cadmium, Copper, Lead and Zinc in Antarctic Snow Samples,
W81-01612 5A

SNOWMELT
Environmental Effects of Western Coal Combustion: Part III-The Water Quality of Rosebud Creek, Montana,
W81-01489 5B

Seasonal Runoff Volumes Conditioned on Forecasted Total Runoff Volume,
W81-01557 2E

SODIUM COMPOUNDS
Elevated Levels of Sodium in Community Drinking Water,
W81-01535 5F

SOIL AMENDMENTS
Urban and Agricultural Development: The Waste Water Role,
W81-01640 5D

SOIL ANALYSIS
Molecular Emission Cavity Analysis, Part 18. Determination of Soluble Sulphate in Waters, Soil, Dusts, and Other Samples,
W81-01619 5A

SOIL CHEMISTRY
Simulation of Soil Nutrients Losses Resulting from Rainfall Acidity,
W81-01579 5C

SOIL CONSERVATION
Empirical Studies of Soil Conservation Techniques and Design Procedures,
W81-01499 4D

Effect of Chisel Versus Moldboard Plowing on Soil Erosion by Water,
W81-01500 2J

SOIL DISPOSAL FIELDS
Soil Potential Ratings for Septic Tank Absorption Fields in Leon County, Florida,
W81-01537 5B

SOIL EROSION
Empirical Studies of Soil Conservation Techniques and Design Procedures,
W81-01499 4D

Effect of Chisel Versus Moldboard Plowing on Soil Erosion by Water,
W81-01500 2J

Soil and Water Losses from Corn-Soybean Rotations,
W81-01502 2J

Influence of Surface Roughness and Clod Size and Stability on Soil and Water Losses,
W81-01503 4D

SOIL MOISTURE
Soil Moisture Sampler and Controller,
W81-01462 3F

SOIL TEXTURE
Size Distribution of Eroded Material from Simulated Rainfall: Effect Over a Range of Texture,
W81-01501 2J

SOIL WATER MOVEMENT
Finite Element Analysis of Solute Transport under Hysteretic Unsaturated Flow Conditions,
W81-01556 2G

SOIL-WATER-PLANT RELATIONSHIPS
Fate of Polychlorinated Biphenyls (PCBS) in Soil-Plant Systems,
W81-01475 5B

SOLAR RADIATION
Apparatus for Desalinating Water,
W81-01463 3A

Apparatus for Desalinating Water,
W81-01464 3A

SOLID WASTES
Codisposal of Municipal Solid Waste and Sludge.
W81-01634 5E

SOLUTES
Finite Element Analysis of Solute Transport under Hysteretic Unsaturated Flow Conditions,
W81-01556 2G

SORPTION
Effectiveness of Land Application for Phosphorus Removal From Municipal Waste Water at Manteca, California,
W81-01551 5D

SPECIATION
Chemical Speciation of Mercury in Natural Waters,
W81-01614 5A

SPECTROPHOTOMETRY
Determination of Trace Elements in Sea Water by Inductively-Coupled Plasma Emission Spectrometry,
W81-01624 5A

SPECTROSCOPY
The Determination of Arsenic by Electrothermal Atomic Absorption Spectrometry with a Graphite Furnace, Part 2. Determination of Arsenic(III) and Arsenic(V) After Extraction,
W81-01613 5A

SPRINKLER IRRIGATION
Low Volume Spray Device for Surface Irrigation System,
W81-01451 3F

Controlled Thrust, Rotary, Adjustable Topography Sprinkler,
W81-01461 3F

STANDARDS
Recommendations for Use of SI Unts in Hydraulics,
W81-01520 7B

STATISTICAL METHODS
Sampling: Defining the Task and Planning the Scheme,
W81-01627 7A

STATISTICAL MODELS
Statistics for Groundwater Quality Assessment,
W81-01635 5G

STORAGE
Stormwater Detention Basins Must Control More Than Runoff,
W81-01527 4A

An Overview of European Water Treatment Practice,
W81-01533 5F

STORM DRAINS
Water Resources for Chicago-History and Future,
W81-01509 5D

On-Site Discharge Solves Stormwater Problems,
W81-01636 4C

STORM RUNOFF
Stormwater Detention Basins Must Control More Than Runoff,
W81-01527 4A

Don't Underestimate Urban Runoff Problems,
W81-01575 5B

On-Site Discharge Solves Stormwater Problems,
W81-01636 4C

Retention Basins: Key to Storm Drainage Plan,
W81-01637 8A

STORM WATER
Impact of Urban Storm Runoff on Stream Quality Near Atlanta, Georgia,
W81-01439 5B

STREAMFLOW
Comment on 'Drainage Network Power' by K. J. Gregory, and Reply by K. J. Gregory,
W81-01517 2E

Hydrologic Regression with Weighted Least Squares,
W81-01558 2E

STREAMFLOW FORECASTING
Distribution-Free Methods for Estimating Flood and Streamflow Exceedance Probabilities by Correlation,
W81-01519 2E

STREAMS
Impact of Urban Storm Runoff on Stream Quality Near Atlanta, Georgia,
W81-01439 5B

Sampling: Defining the Task and Planning the Scheme,
W81-01627 7A

STRONTIUM RADIOISOTOPES
A Simple and Rapid Method of Collecting Radionuclides from Rain Water,
W81-01622 5A

SUCCESSION
Ecological Aspects of Lake Nasser-Nubia,
W81-01564 2H

SULFATES
Molecular Emission Cavity Analysis, Part 18. Determination of Soluble Sulphate in Waters, Soil, Dusts, and Other Samples,
W81-01619 5A

SULFUR COMPOUNDS
Determination of Cyanide in the Presence of Mercaptans with a Selective-Electrode,
W81-01620 5A

SURFACE ROUGHNESS
Influence of Surface Roughness and Clod Size and Stability on Soil and Water Losses,
W81-01503 4D

SURFACE RUNOFF
Deforestation and Increased Flooding of the Upper Amazon,
W81-01629 4C

SURVEYS
State of Washington Industrial Waste Survey.
W81-01434 5D

SUSPENDED LOAD
Sediment Loads From Headwaters of the East-Central Sierra Watersheds,
W81-01427 2J

SUSPENDED SEDIMENTS
Phosphorus in Suspended Sediments of the Amazon River,
W81-01583 5B

SUSPENDED SOLIDS
Fine Solids Removal Following Combined Chemical-Trickling Filter Treatment,
W81-01436 5D

Effect of Pretreatment on the Filtration of Low Turbidity Secondary Effluent,
W81-01481 5D

TARS
The Distribution of Pelagic Tars and Plastics in the South Atlantic Bight,
W81-01602 5B

TERNS
Tissue Distribution of Mercury in Normal and Abnormal Young Common Terns,
W81-01649 5C

TERTIARY TREATMENT
Waste Water Treatment in the Mediterranean Zone: Study of Various Solutions Used on the French Coast. (Problemes Poses Par L'Epuration Des Eaux Residuaires Urbaines En Zone Mediterraneenne -- Etude De Diverses Solutions Appliquees Sur La Cote Francaise.),
W81-01472 5D

TEXAS
Analysis of Digitized M-33 Radar Data from Texas Hiplex, 1976-1978,
W81-01480 3B

THAMES RIVER (CT)
Dispersal of Microfungi in the Thames River Estuary of Eastern Long Island Sound,
W81-01589 2L

THERMAL POLLUTION
Characteristics of Full and Partial Multiport Diffusers Discharging Thermal Wastes in Open Channel Flow,
W81-01473 5E

Effects of Thermal Pollution on Pelagic Larvae of Crustacea,
W81-01482 5C

TIDAL EFFECTS
Control of a Fjord Basin's Dynamics by Tidal Mixing in Embracing Sill Zones,
W81-01586 2L

TIDES
Velocity Surges and Asymmetry in Tidal Channels,
W81-01584 2L

TIME SERIES ANALYSIS
Detection of Water Quality Changes Through Optimal Tests and Reliability of Tests,
W81-01466 7B

TOLEDO (OH)
No Nonsense Management: Key to Successful Wastewater Plant Operation,
W81-01631 5D

TRACE ELEMENTS
Evaluation and Application of Dialysis Titration Technique for Determination of Complexing Capacity of Freshwaters,
W81-01471 5A

An Evaluation of Differential Pulse Anodic Stripping Voltammetry at a Rotating Glassy Carbon Electrode for the Determination of Cadmium, Copper, Lead and Zinc in Antarctic Snow Samples,
W81-01612 5A

Determination of Trace Elements in Sea Water by Inductively-Coupled Plasma Emission Spectrometry,
W81-01624 5A

TRANSPORT EQUATION
Comment on 'A New Collocation Method for the Solution of the Convection-Dominated Transport Equation' By George E. Pinder and Allen Shapiro,
W81-01514 5B

TREATMENT FACILITIES
Package Water Treatment Plants, Volume 1. A Performance Evaluation,
W81-01440 5F

New Day Dawns for California Water,
W81-01576 5F

Austin's Interceptor and Treatment Plant: Engineering Wonder,
W81-01641 8A

Economical Zero Discharge Achieved at Water Plant,
W81-01643 5F

TROUT CREEK (CO)
Environmental Effects of Western Coal Surface Mining, Part VIII-Fish Distribution in Trout Creek, Colorado, 1975-1976,
W81-01488 5C

TURBIDITY
Effect of Pretreatment on the Filtration of Low Turbidity Secondary Effluent,
W81-01481 5D

ULTRAFILTRATION
Feasibility of Purification and Concentration of Selected Waste Water Streams by Ultrafiltration,
W81-01497 5D

UNITED KINGDOM
The Role of Predation in Causing Major Changes in the Limnology of a Hyper-Eutrophic Lake,
W81-01594 2H

URANIUM
Separation of Uranium from Natural Waters on Chelex-100 Resin,
W81-01616 5D

URBAN RUNOFF
Impact of Urban Storm Runoff on Stream Quality Near Atlanta, Georgia,
W81-01439 5B

Don't Underestimate Urban Runoff Problems,
W81-01575 5B

URBAN WATER SUPPLY
Planning Groundwater Supply Systems for Urban Growth: A Multilevel Perspective,
W81-01498 6A

URBANIZATION
Stormwater Detention Basins Must Control More Than Runoff,
W81-01527 4A

On-Site Discharge Solves Stormwater Problems,

SELECTED WATER RESOURCES ABSTRACTS

VOLUME 14, NUMBER 10
MAY 15, 1981

W81-01651 -- W81-01900
CODEN: SWRABW

SELECTED WATER RESOURCES ABSTRACTS (SWRA) is produced by the Office of Water Research and Technology, U.S. Department of the Interior, and published twice monthly by the National Technical Information Service (NTIS), U.S. Department of Commerce.

SWRA is available to Federal agencies and their contractors or grantees in water resources research upon request, citing contract or grant number and sponsoring agency. Write: Office of Water Research and Technology, U.S. Department of the Interior, Washington, DC 20240. The **SWRA Journal** is also available on subscription from NTIS, 5285 Port Royal Road, Springfield, VA 22161. Annual subscription rates for the North American Continent are: Journal only, $100; Journal and Annual Indexes, $125; Indexes only, $50.Other addressees, write for prices.

Some documents abstracted in this journal can be purchased from NTIS. Price codes are given in the entries and a current code-price conversion table is printed on the outside back cover. Other documents are available from originating organizations or authors as indicated in the citation.

SELECTED WATER RESOURCES ABSTRACTS

A semimonthly publication of the Office of Water Research and Technology,
U.S. Department of the Interior

VOLUME 14, NUMBER 10
MAY 15, 1981

W81-01651 -- W81-01900

The Secretary of the Interior has determined that the publication of the periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1983.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

PREFACE

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. These documents cover water resources as treated in the life, physical, and social sciences and the related engineering and legal aspects of the characteristics, supply condition, conservation, control, use, or management of water resources. Each abstract includes a full bibliographic citation and a set of descriptors which are listed in the **Water Resources Thesaurus.** The abstract entries are classified into 10 fields and 60 groups similar to the water resources research categories established by the Committee on Water Resources Research of the then Federal Council for Science and Technology.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several services of the Office of Water Research and Technology. The cumlative SWRA file from 1968 and monthly updates are available also in magnetic tape through lease from NTIS.

THE OFFICE OF WATER RESEARCH AND TECHNOLOGY DOES NOT PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Comments and suggestions concerning the contents and arrangement of this bulletin are welcome.

CONTENTS

SUBJECT FIELDS AND GROUPS

Please use the edge index on the back cover to locate Subject Fields and Indexes.

01 NATURE OF WATER

Includes the following Groups: Properties; Aqueous Solutions and Suspensions.

02 WATER CYCLE

Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION

Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL

Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Nonwater Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION

Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING

Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA

Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS

Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES

Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION

Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

MAN OUTMATCHES MATH MODELS FOR FLOOD FREQUENCY,
Pima County Flood Control Districts, Tucson, AZ.
B. M. Reich.
Public Works, Vol 111, No 7, p 56-57, July, 1980. 1 Fig, 2 Tab.

Descriptors: *Graphical analysis, *Flood forecasting, *Mathematical models, Streamflow, Analytical techniques, Graphical methods, Flood protection, Flood data, Flow rates, Flood control.

A mathematical graphical method is described, based on sound statistical reasoning, that can be used to make estimates of the 100-year flood. The largest and smallest estimates obtained by 31 students with this method were 9,200 and 7,000 cfs for this example using 20 yr of good flood data from a 57.7 square mile watershed in Southeastern Arizona. Five common mathematical models were used for the same estimates, and the Q-100 values thus obtained ranged from 5,540 to 60,870 cfs from the same flood series. (Baker-FRC)

2B. Precipitation

DROUGHT AND OUR DESTINY,
T. C. Robertson.
Veldtrust (Johannesburg), p 4-7, Autumn, 1979.

Descriptors: *Droughts, *Africa, *Hydrologic budget, *Precipitation(Atmospheric), *Climatic data, Climates, Climatic zones, Effective precipitation, Climatology, Geographical regions, Regions, Foreign countries, Subtropic, Tropic, Meteorology, Water shortage, Water utilization, Rainfall, Weather forecasting, Probable maximum precipitation, Floods, Weather data, Moisture deficit, Vegetation effects, *South Africa.

A historical account is given concerning numerous attempts (since 1914) to give a scientific explanation of the problems posed by seasons of diminished rainfall in South Africa. The Drought Investigation Commission and the Select Committee of the Senate, which investigated droughts/rainfall/soil erosion in 1914, felt that if high/low rainfall cycles occurred, it should be possible to locate and predict them. In 1934 Schumann and Thompson divided the country into 32 rainfall districts and collected all weather data recorded during the past 55 years. In 1965, Midgley produced a runoff hydrograph (showing tall peaks of the 1943 and 1954 floods, and graph valleys for the 'great four years drought' (1930-1933)) for the river at Vaaldam. Worthington felt prior to the recent severe drought in the Sahel region, that the drought-striken parts of Africa might experience extensive depopulation during a prolonged cycle of drier years. An exhaustive 8-year analysis of rainfall statistics dating back to 1910 generated a graph indicating 10-year cycles of 20-30% higher to 20-30% lower rainfall than average. The country reached the peak of wet period by 1976 and is now on the decline to fall below average by 1981. (Zielinski-IPA)

2D. Evaporation and Transpiration

EVAPORATION FROM A SPHAGNUM MOSS SURFACE,
North Central Forest Experiment Station, Grand Rapids, MN.
D. S. Nichols, and J. M. Brown.
Journal of Hydrology, Vol 48, p 289-302, November, 1980. 2 Fig, 2 Tab, 38 Ref.

Descriptors: *Evaporation, *Evapotranspiration, *Mosses, Peat, Energy budget, Wetlands, *Bogs, Hydrologic cycle, Temperature, Vapor pressure, Solar radiation, Minnesota, Great Lakes Region, *Sphagnum, Bowen ratio.

Peat cores, 45 cm in diameter, were collected from a sphagnum bog in northern Minnesota, and used to measure the effects of different temperatures and water levels on evaporation from a sphagnum moss surface in a growth chamber. Under all conditions, evaporation from the moss surface was greater than that from a free-water surface. Evaporation from the moss increased 92% as the temperature was raised from 9 to 25C. The energy used in evaporation from the moss exceeded net radiation except at 9C. Evaporation from the moss was less when the water level was at the surface of the peat than when it was lowered to 5, 10, or 15 cm below the surface. The presence of an overstory of grasses and sedges protected the moss from desiccation when the water level was 15 cm below the surface, but had no effect on total water vaporization at any water level. When the peat cores were maintained in the greenhouse for a year, changes in either the peat, the moss, or both occurred which resulted in significantly lower evaporation when measured in the growth chamber.

2E. Streamflow and Runoff

FLOW CHARACTERISTICS OF NEW MEXICO STREAMS, PART I. FLOW DURATION,
Geological Survey, Albuquerque, NM. Water Resources Div.
L. J. Reiland.
New Mexico State Engineer Special Report, 1980. 115 p, 9 Fig, 4 Tab, 2 Ref.

Descriptors: *Flow characteristics, *Streams, *Flow duration, Data collections, *Streamflow, New Mexico, Colorado, Oklahoma, Discharge(Water), Natural flow, Gaging stations, Sites.

Flow-duration tables have been developed from daily streamflow records collected at 156 gaging stations in New Mexico and parts of Colorado and Oklahoma. These tables show the percentages of time that various daily discharges were equaled or exceeded. Records for 32 long-term gaging sites having virtually natural flows were selected as index stations. By correlation with the long-term records, flow-duration data obtained at 70 short-term stations have been extended in time to represent data for a 43-year base period, 1931-73. Flow-duration data obtained at eight short-term stations have been extended to represent data for a 39-year base period, 1935-73. For 38 stations flow-duration tables are presented only for the period of record, there being no reliable basis for extending the record. (USGS)

STATISTICAL SUMMARIES OF SELECTED STREAMFLOW DATA--SOUTH PLATTE RIVER IN COLORADO AND NEBRASKA; NORTH PLATTE AND PLATTE RIVERS IN NEBRASKA,
Geological Survey, Denver, CO. Water Resources Div.
H. E. Petsch, Jr., K. B. Rennick, and C. F. Nordin, Jr.
Available from the OFSS, USGS Box 25425, Fed. Ctr. Denver CO 80225. Geological Survey Open-File Report 80-679, 1980. 278 p, 1 Fig, 3 Ref.

Descriptors: *Hydrologic data, *Streamflow, *Data collections, *Colorado, *Nebraska, Surface waters, Runoff, Gaging stations, Sites, Flow characteristics, Discharge(Water), *South Platte River(CO-NE), *North Platte River(NE), Platte River(NE).

This report is a compilation of statistical summaries of streamflow data for 22 gaging stations on the South Platte River in Colorado and Nebraska, and the North Platte and Platte Rivers in Nebraska. (USGS)
W81-01676

RESISTING THE DROUGHT,
T. C. Robertson.
Veldtrust (Johannesburg), p 7-9, Autumn, 1979.

Descriptors: *Drought, *Drought resistance, *Agroclimatology, *Africa, *Farm management, Hydrologic budget, Precipitation(Atmospheric), Environmental effects, Arid lands, Agriculture, Moisture deficit, Effective precipitation, Climates, Climatic zones, Climatology, Geographical regions, Regions, Foreign countries, Meteorology, Water shortage, Water utilization, Probable maximum precipitation, Groundwater, *South Africa.

An exhaustive 8-year analysis of rainfall statistics dating back to 1910 generated a graph indicating 10-year cycles of 20-30% higher to 20-30% lower rainfall than average. South Africa reached the peak of wet period by 1976 and is now on the decline to fall below the average rainfall level by 1981. The practical use to which farmers can put this knowledge is discussed. The author discusses soil erosion and various attempts undertaken since 1914 to create a public awareness of the drought problem. The 1923 'Blue Book' report and van Reenen's 1935 book, 'Resisting Drought', are discussed, calling attention to soil conservation, and factors as overgrazing, 'fodder banks', and burning the veld. The idea of conquering the dongas has been uppermost in the minds of soil scientists/engineers for many years and large-scale engineering attempts were made at Vlekpoort to 'cure' dongas. The new discipline of 'bioclimatology' (study of climate effects on life), and the science of agro-meteorology have provided advice to farmers to prepare against drought. (Zielinski-IPA)

AGRICULTURAL RUNOFF DURING A DROUGHT PERIOD,
Science and Education Administration, Lincoln, NE.
J. S. Schepers, E. J. Vavricka, D. R. Anderson, H. D. Wittmuss, and G. E. Schuman.
Journal of the Water Pollution Control Federation, Vol 52, No 4, p 711-719, April, 1980. 3 Fig, 7 Tab, 30 Ref.

Descriptors: *Runoff, *Agricultural watersheds, *Droughts, Precipitation(Atmospheric), Sediment transport, Sediment load, Nutrients, Water quality, Coliforms, Nebraska.

Basic research on agricultural runoff during a dry period is supplemented with specific examples from a 2025-ha agricultural water shed. Runoff from the Dee Creek watershed in Nebraska was analyzed over a three-year period of less than normal precipitation. Runoff amounted to less than 2% of the incoming moisture, and sediment losses were less than 0.7 metric ton/ha-year. Nutrient losses associated with the sediment averaged 74% of the total N losses and 76% of the total P losses. Nutrient loss was not consistently related to fertilizer application. The results of this study are in line with data in the literature which suggest that nutri-

ent discharge is highly dependent upon sediment loss. Water quality of the runoff was also determined. Over 90% of the samples collected exceeded recommended recreational water quality standards for total coliforms and fecal coliforms. Base flows exceeded the same standards 90% of the time for total coliforms and 45% of the time for fecal coliforms. (Small-FRC)

APPROXIMATE METHOD FOR QUICK FLOOD PLAIN MAPPING,
Army Engineer District, Mobile, AL.
R. F. Powell, L. D. James, and D. E. Jones.
Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers, Vol 106, No WR1, p 103-122, March, 1980. 11 Fig, 5 Tab, 3 Ref.

Descriptors: *Flood forecasting, *Flood routing, *Flood profiles, Flood data, Flood plains, Mapping, Curves, Mathematical studies, Estimating, *Flood plain mapping.

An approximate method is presented for mapping flood hazard in locations where normal flood hazard mapping has not been completed or would be too expensive. The method is based on normalized curves which can be used with often readily available information on 10 and 25 year floods to estimate large floods. These estimations can be used in flood warning systems or for structural design or regulatory purposes. The results can also be used to verify mapping efforts. If the discharges of two flood frequencies of common occurrence and the shape of the flood frequency curve are known, the information on the two floods can be extrapolated to estimate the discharge for less frequent flood discharges. Annual flood peaks are assumed to follow the log Pearson Type II distribution recommended by the Water Resources Council. The skewness of the data is calculated. Normalized state curves are used which incorporate the effects of the shape and roughness of the flood plain cross sections, stream slope, and other factors that influence the stage-discharge relationship. (Small-FRC)
W81-01837

OPTIMAL CONTROL OF UNSTEADY COMBINED SEWER FLOW,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
J. W. Labadie, D. M. Morrow, and Y. H. Chen.
Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers, Vol 106, No WR1, p 205-223, March, 1980. 8 Fig, 2 Tab, 23 Ref.

Descriptors: *Storm runoff, *Overflow, *Sewers, Computer models, Optimization, Water pollution sources, Runoff forecasting, Routing, Control, *Combined sewers.

Computerized control of stormwater runoff and combined sewer overflows is discussed. Combining realistic unsteady flow routing with optimization techniques for determining operating policies is one of the challenges of the computerized approach. Untreated overflows must be avoided or at least regulated in time to minimize pollution impacts. The Marina branch of the planned North Shores Outfalls Consolidation Project in San Francisco is presented as a case study. Here a fully dynamic, unsteady flow model was included within a deterministic dynamic programming formulation of the control problem. Orthogonal polynomials were used. This system showed significant savings in computer time and computer storage requirements over incremental dynamic programming solutions. The algorithm used rapidly determines improved control policies. This technique may be feasible for actual real time use. (Small-FRC)

BROOK RECHANNELING DEMANDS INTER-AGENCY COORDINATION,
W. A. Farrell.
Public Works, Vol 111, No 8, p 70-72, August, 1980. 1 Fig.

Descriptors: *Flood control, *Water management(Applied), Flow control, *Channeling, Flooding, *Flood routing, Flood protection, Flood plain zoning, Chutes, Civil engineering, Floodproofing, Watershed management, Connecticut, Trout Brook Channel(CT).

Plans are outlined for the reconstruction of 10,000 feet of Trout Brook Channel, a tributary of the Park River Watershed on the flood plain of the South Branch, located near West Hartford, Connecticut. The adjacent flood plain will accommodate floods which now inundate a sizeable residential area on an average of once/year. The plan involved the cooperation of all three levels of government along with public and private utilities. Cooperation was needed among the State Department of Environmental Protection, Soil Conservation Service of the USDA, State Department of Transportation, engineering firms, metropolitan district commissions, Connecticut natural gas company, Hartford Electric Light Company, Southern New England Telephone Company, and Hartford Cable Television. When completed the project will have cost several millions of dollars and should eliminate the recurring flood damage. (Baker-FRC)
W81-01884

2F. Groundwater

HYDROLOGY AND MODEL STUDY OF THE PROPOSED PROSPERITY RESERVOIR, CENTER CREEK BASIN, SOUTHWESTERN MISSOURI,
Geological Survey, Rolla, MO. Water Resources Div.
E. J. Harvey, and L. F. Emmett.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A089782, Price codes: A04 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigation 80-7, June, 1980. 50 p, 16 Fig, 4 Tab, 17 Ref.

Descriptors: *Multiple-purpose reservoirs, *Groundwater, *Model studies, *Karst, *Missouri, Hydrogeology, Limestones, Underground streams, Water wells, Water yield, Mine drainage, Water quality, Water analysis, *Jasper County(MO), Center Creek basin(MO), Oronogo-Duenweg Belt(MO).

A reservoir has been proposed on Center Creek, Jasper County, southwestern Missouri. Groundwater levels in the limestone uplands adjacent to the reservoir will rise when the impoundment is completed. The site is a few miles upstream from the Oronogo-Duenweg belt in the Tri-State zinc district. Grove Creek joins Center Creek downstream from the reservoir separating it from the mining belt. A model study indicates water-level rises varying from about 20 feet near the reservoir to 0.5 to 1.0 foot in the southern part of the Grove Creek drainage basin. A significant rise in the water table adjacent to the reservoir could increase mine-water discharge if Grove Creek is not an effective drain. However, it is probable that Grove Creek is an effective drain, and the higher groundwater levels in the reservoir area will increase ground-water discharge to Grove Creek, and in turn, Center Creek. The increase in ground-water discharge to Grove Creek will have the beneficial effect of diluting mine-water discharge from the Oronogo-Duenweg belt during periods of low flow. (USGS)

CHARACTERISTICS OF THE GROUNDWATER SEEPAGE INTO GREAT SOUTH BAY,
State Univ. of New York at Stony Brook. Marine Sciences Research Center.
H. J. Bokuniewicz, and M. J. Zeitlin.
Special Report 35, March 1980. 32 p, 14 Fig, 2 Tab, 22 Ref, Append.

Descriptors: *New York, *Groundwater movement, *Seepage, *Water sources, Pore water, Aquifers, Bays, Subsurface flow, Coastal areas, Discharge movement, Discharge(Water), Freshwater, Hydrography, Saline water-freshwater interfaces, Outflow, *Great South Bay(NY).

The submarine outflow of groundwater across the floor of Great South Bay in New York contributes fresh water to the Bay. The groundwater flow is especially important in Great South Bay for maintaining water quality and for supporting the hard clam industry. This study measures the source directly and is the first study of the submarine outflow into Great South Bay or into any body of coastal water. Preliminary work showed that much of the seepage occurred within 100 meters of the shore. Submarine outflow rates were as high as 150 liters/day per square meter. Outflow near the shore was typically 50 liters/day per square meter and decreased to about 30 liters/day per square meter at a distance of 100 meters offshore. The typical value of the submarine outflow was calculated to be 4.1 x 10 to the 8th power liters per day. This calculation excluded measurements made near Fire Island, but suggests that significant amounts of groundwater may enter the bay far from shore due to sustained upward leakage from deep aquifers. As a result, the calculated value is an underestimate. It was also found that the flow rate tended to vary with coastal flooding and rainfall. The outflow rates are relatively large and should significantly affect the pore water chemistry. (Garrison-Omniplan)
W81-01741

2G. Water In Soils

THE VARIATION OF IN SITU MEASURED SOIL WATER PROPERTIES WITHIN SOIL MAP UNITS,
Department of Agriculture, Ottawa (Ontario). Land Resource Research Inst.
G. C. Topp, W. D. Zebchuk, and J. Dumanski.
Canadian Journal of Soil Science, Vol 60, No 3, p 497-509, August, 1980. 8 Fig, 3 Tab, 10 Ref.

Descriptors: *Hydraulic conductivity, *Soil texture, *Soil water, Adsorption, Soil types, Porosity, Pore water, On-site tests, Cores, Soil profiles, Geographical regions, *Canada, Soil investigations.

The in situ saturated hydraulic conductivities of nine soil units from the Ottawa-Carleton region were recorded, and core samples were taken at each site for laboratory tests to determine desorption water capacity relationships. For the coarse- and fine-textured soils, similar hydraulic conductivities were found, which were higher than those observed for the medium textured soils. However, measurably different desorption curves were found for each of the coarse- and fine-textured soil units examined. Variability of hydraulic conductivity duplicate measurements at the sites was found to be much less than that of the soil unit as a whole. Two separate groups of soil with significantly different hydraulic conductivities were discerned. A third, intermediate group was also recognized which was not significantly different from the other two groups. Desorption curves were studied

in relation to means of identifying proportions of pore space attributable to structural pores or textural pores and differences in pore size distributions. (Geiger-FRC)
W81-01782

MODELING INFILTRATION,
Bidnan Chandra Krishi Viswa Vidyalaya, Kalyani (India). Dept. of Agricultural Engineering.
R. K. Ghosh.
Soil Science, Vol 130, No 6, p 297-302, December, 1980. 1 Fig, 4 Tab, 10 Ref.

Descriptors: *Mathematical models, *Infiltration, *Soil water movement, Model studies, Hydraulic conductivity, Hydrologic properties, Lewis-Kostiakov equation, Philip's equation, Equations.

A model for infiltration, combining the Lewis-Kostiakov equation and Philip's two-term infiltration equation, is proposed: I = (a times t to the b power) + (K sub s times t), where I = total quantity of water infiltrated, a and b are variables, t = time, and K sub s = saturated hydraulic conductivity of the soil. Comparisons with experimental and calculated data show that results agree over a complete range of times and that the equation is especially suited for long periods, for example, 72 hours. (Cassar-FRC)
W81-01847

2H. Lakes

HEAT TRANSFER IN IRRADIATED SHALLOW LAYERS OF WATER,
Purdue Univ., Lafayette, IN. School of Mechanical Engineering.
M. Behnia, and R. Viskanta.
Paper AIAA-80-1519 presented at AIAA 15th Thermophysics Conference, July 14-16, 1980, Snowmass, Colorado. 8 p, 9 Fig, 15 Ref. American Institute of Aeronautics and Astronautics, New York, NY. OWRT B-077-IND(6).

Descriptors: *Heat transfer, *Temperature distribution, *Radiation, Solar radiation, Thermal radiation distribution patterns, Energy transfer, Irradiation, Ponds, *Thermal stratification, Salinity, Shallow water.

The paper reports on an experimental and analytical investigation of temperature structure in a shallow layer of water heated by an external radiation source. Experiments have been performed in a test cell of known bottom reflection characteristics and suitable for optical observations. A shadowgraph and a Mach-Zehnder interferometer were used to visualize and measure the unsteady temperature profile in the water during irradiation. Experimental results obtained show that absorption of radiant energy by the substrate and/or by the water near the bottom results in an unstable situation and that natural convection flow develops. However, with continued heating the flow is suppressed. Analytical results, supported by the data, indicate that the spectral radiation characteristics of the bottom, and the depth of the water have a decisive influence on the temperature distribution.
W81-01697

LAKE KINNERET: CARBON FLOW PATTERNS AND ECOSYSTEM MANAGEMENT,
Isreal Oceanographic and Limnological Research Ltd., Tiberias.
C. Serruya, M. Gophen, and U. Pollingher.
Archiv fur Hydrobiologie, Vol 88, No 3, p 265-302, April, 1980. 14 Fig, 8 Tab, 85 Ref.

Descriptors: *Food webs, *Carbon, *Zooplankton, Phytoplankton, Seasonal, *Ecosystems, Productivity, Fish food organisms, Cycles, Food chains, Lakes, Israel, *Lake Kinneret(Israel).

As part of a series of studies to establish the energy budget of Lake inneret (Israel), different food web strategies were observed and analyzed quantitatively in terms of carbon flow. Over a ten year period, three main patterns of carbon flow were observed: the Peridinium, the nannoplankton, and the nannoplankton-sardine patterns. Carbon inputs of Lake Kinneret were mainly from internal sources. A maximum of 12% of the total carbon input during rainy winters and approximately 4% during summers is carbon channelled toward sedimentation. This factor severely limits the development of benthic fauna. Fifty percent of the total planktic carbon productivity in winter results from zooplankton eating Peridinium. In spring, the nannoplankton-zooplankton foodchain becomes dominant. The lake accumulates organic carbon in the winter-spring, and the resulting reserves are used in summer to cover the high maintenance requirements of the community. A condition of zero net production prevails in summer, which is suboptimum for fish. (Small-FRC)
W81-01777

LIMNOLOGICAL STUDIES ON LAKE PAMVOTIS (IOANNINA), GREECE, I. HYDROCLIMATOLOGY, PHYTOPLANKTON-PERIPHYTON WITH SPECIAL REFERENCE TO THE VALENCY OF SOME MICROORGANISMS FROM SULPHURETA AS BIOINDICATORS,
Athens Univ. (Greece). Inst. of Systematic Botany.
K. Anagnostidis, and A. Economou-Amilli.
Archiv fur Hydrobiologie, Vol 89, No 3, p 313-342, July, 1980. 5 Fig, 2 Tab, 116 Ref.

Descriptors: *Phytoplankton, *Periphyton, Aquatic life, Limnology, Lakes, Water quality, Bioindicators, Greece.

Phytoplankton and periphyton from Lake Pamvotis, Greece, were studied as part of a series of studies on the limnology and water quality of the lake. Lake Pamvotis is located in the northwestern part of Greece, about 1 km from Ioannina. Information is presented on the microflora investigations of Greek lakes, the geomorphology and climate of the Lake Pamvotis area, and a flora analysis of the phytoplankton and periphyton collected during 1967 and 1970. From the samples collected, 292 taxa were identified: 42 bacteria, 83 Cyanophyta, 78 Chlorophyta, 67 Bacillariophyta, 3 Chrysophyta, 9 Euglenophyta, 2 Xanthophyta, 3 Pyrrhophyta, 6 Mycophyta. All taxa found are listed, and their habitat is described. Most of the investigated biotopes were characterized as sulfidic. Forty-six species of sulfur bacteria, iron bacteria, and apochlorotic Cyanophyta were included in the saprobic systems as bioindicators. (Small-FRC)
W81-01789

2J. Erosion and Sedimentation

THE VOLUME OF SAND AND GRAVEL RESOURCES IN THE LOWER BAY OF NEW YORK HARBOR,
State Univ. of New York at Stony Brook. Marine Sciences Research Center.
H. J. Bokuniewicz, and C. T. Fray.
Special Report 32, December, 1979. 34 p, 8 Fig, 2 Tab, 20 Ref, Append.

Descriptors: *New York, *Sands, *Gravels, *Harbors, *Sediments, Sediment density probes, Silts, Seismic properties, Mud, Mud-water interfaces, Marine geology, Sedimentation, Hydrogeology, Marine geology, Particle size, Resources.

To guide future exploration and management of submarine sand resources, four types of information were studied in the shallow (<100-foot) stratigraphy of the Lower Bay floor: (1) core and boring logs, (2) seismic reflection profiles, (3) surficial sediment distribution on the floor of the Lower Bay, and (4) the stratigraphy in Long Island, Staten Island, northern New Jersey and the New York Bight. The study was designed to identify potential mining areas so surficial layers were given particular attention. In general, marine sands overlie glacial outwash sands which, in turn, overlie unconsolidated Cretaceous sediments. Along the margins of the Bay, sands are known to rest on fine-grained deposits at depth; the composition of layers underlying the surficial sand deposits in the central and eastern Bay is unknown. Surficial mud deposits are confined primarily in the Rariran and Sandy Hook Bays, and may be as much as 150 feet thick. Sand deposits were identified that have a total volume of 3,429 million cubic yards. Sand and gravel resources for mining are plentiful, but not all of them can be exploited. Submarine mining must coexist with such other uses as shipping, fishing, and recreation; environmental effects must be considered; and not all of the available sand and gravel is of usable quality. Further study is needed to establish acceptable mining zones and regulations. (Garrison-Omniplan)

2K. Chemical Processes

CHEMICAL AND PHYSICAL CHARACTERISTICS OF PRECIPITATION AT SELECTED SITES IN FLORIDA,
Geological Survey, Tallahassee, FL. Water Resources Div.
G. A. Irwin, and R. T. Kirkland.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-159949, Price codes: A04 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 80-81, 1980. 70 p, 6 Fig, 2 Tab, 36 Ref.

Descriptors: *Chemistry of precipitation, *Precipitation(Atmospheric), *Water quality, Water analysis, *Florida, Data collections, Sampling, Sites, Baseline studies, Specific conductivity, Calcium, Sodium, Clorides, Hydrogen ion concentration, Nitrogen, Phosphorus, Iron, Lead.

Infrequent sampling of precipitation in Florida has been conducted by the U.S. Geological Survey since 1965. A summary of the historical data from 24 sites throughout Florida indicate that the principal ionic composition of atmospheric precipitation samples is calcium-sodium and bicarbonate-chloride with an average specific conductance of 32 micromhos per centimeter at 25 C. Historically, much of the sampling focused on primary nutrients and selected trace elements. Historical data indicate that nitrogen and phosphorus concentrations averaged 1.1 and 0.1 milligrams per liter, respectively. The limited trace metal data indicate that motor-vehicle activity may have a significant impact on local precipitation quality. Lead, for example, was measured in concentrations of as much as 2,400 micrograms per liter in samples collected in a highly populated, commerical area in south Florida. Statistical testing indicated that most major inorganic constituents, primary nutrients, and trace metals were significantly differnet among the sampling sites. The pH data indicated a range of about 5.0 to 7.0, but only limited pH data were collected and analyzed at the historical sites in such a timely manner as to represent pH conditions of the atmospheric precipitation during active rainfall. A critical review of the historical data suggested that while they may reflect local atmospheric quality conditions they likely do not define baseline conditions from a regional perspective. The application of these data were generally limited regarding regional extrapolation due to lack of standardization of sampling techniques, variable methods of sample preservation, nonuniform sampling intervals, variable sample sizes, and different periods of record. ECOLOGY OF SOUTHERN AFRICAN ESTUARIES. PART XI. MNGAZANA: A MANGROVE ESTURARY IN TRANSKEI,
Cape Town Univ. (South Africa). Dept. of Zoology.
G. M. Branch, and J. R. Grindley.
South African Journal of Zoology (Pretoria), Vol

14, No 3, p 149-170, 1979. 16 Fig, 11 Tab, 25 Ref, 2 Append.

Descriptors: *Estuaries, *Estuarine environment, *Africa, *Ecology, *Chemical analysis, Water analysis, Biomass, Physical properties, Bodies of water, Aquatic habitats, Aquatic environment, Balance of nature, Ecosystems, Geographical regions, Climatic zones, Regions, Foreign countries, Ecological distribution, Tropic, Subtropic, Environmental gradient, *Transkei(Africa).

This survey was conducted to provide information to the Transkeian Government relative to its concern of rational conservation/utilization of its coastal areas. Mngazana supports the richest estuarine fauna and flora known in Transkei and some of the best developed mangroves in southern Africa. Invertebrate fauna includes temperate, tropical, and subtropical species. Compared to the fauna of soft substrates, that of rocks has a higher percentage of stenohaline and estuarine forms, and a more restricted distribution. A high percentage of the biomass of invertebrates in soft substrates consists of detritivores, and the biomass is related to the organic content of the substrate. Physical factors, dissolved oxygen, water transparency, salinity, nitrate, nitrite, silicate, total phosphorus, substrate particle size, and percent organic material in the substrate were determined. Nine sampling stations were used. Mangrove mud has the highest organic content and supports the highest biomass, but few species can tolerate the conditions there. Mangroves are probably the major primary producers in the system. Mngazana's features makes its conservation of unquestionably high importance. (Zielinski-IPA)

A MATHEMATICAL MODEL OF THE KOKSOAK RIVER. (MODELE MATHEMATIQUE DE LA RIVIERE KOKSOAK),
Laval Univ. (Quebec). Dept. of Civil Engineering.
Y. Quellet, and Y. Ropars.
Canadian Journal of Civil Engineering, Vol 7, No 3, p 477-491, September, 1980. 16 Fig, 16 Ref. (English Summary).

Descriptors: *Estuaries, *Model studies, *Salinity, Tides, Rivers, Mathematical models, Koksoak River(Canada), Kuuijjuaq River(Canada), *Canada.

An unidimensional mathematical model using the finite differences method has been developed to study the effects on tides and salinity distribution of a reduction of freshwater discharge in an estuary, the Koksoak River, flowing into Ungava Bay, Canada. Although data were not complete or precise enough to make definite conclusions, some general trends were observed in the comparison between simulated canals and the river itself. (Cassar-FRC)

INFLUENCE OF BIOLOGICAL AND PHYSICAL PROCESSES ON DISSOLVED OXYGEN DYNAMICS IN AN ESTUARINE SYSTEM: IMPLICATIONS FOR MEASUREMENT OF COMMUNITY METABOLISM,
Maryland Univ., Cambridge. Center for Estuarine and Environmental Studies.
W. M. Kemp, and W. R. Boynton.
Estuarine and Coastal Marine Science, Vol 11, No 4, p 407-431, October, 1980. 5 Fig, 4 Tab, 73 Ref.

Descriptors: *Dissolved oxygen, *Aquatic ecosystems, *Estuaries, Respiration, Advection, Photosynthesis, *Chesapeake Bay, Biological communities, Diel migration, Diffusion, Fluctuations, Abiotic environment, Diurnal, Nutrients.

The dynamics of dissolved oxygen (DO) were studied in the estuarine ecosystem near Calvert Cliffs, Chesapeake Bay. Community photosynthesis and respiration rates were calculated in several areas of the bay from time course fluctuations of DO in the open water and in bottles and benthic chambers. Measurements of oxygen diffusion across the air/water interface and of the DO levels in the vertical plane of the water column were performed. Horizontal net dispersion of oxygen was measured as the difference. About 50% of the total oxygen flux at deeper stations is due to biological factors, and 50% to physical processes. Mean values of community photosynthesis accounted for 50% of the total inputs to the supply of DO, while community respiration made up 43% of the outflows. Atmospheric gas transfer contributed about 8% of the inputs and 3% of the outputs. Horizontal dispersion was responsible for about 40-50% of the DO changes in either direction. Differences in photosynthesis and respiration between open and closed systems were found on 11 of 16 occasions and were probably due to artificial decoupling of the experimental environment from major routes of nutrient flux. Open water estimates provided more realistic DO patterns. Some specifications are offered for aquatic environments to be used in open-water methods. (Geiger-FRC)

COMPARISON OF METHODS FOR ANALYSIS OF THE TRANSVERSE AND VERTICAL CIRCULATION CONTRIBUTIONS TO THE LONGITUDINAL ADVECTIVE SALT FLUX IN ESTUARIES,
Washington Univ., Seattle. Dept. of Oceanography.
M. Rattray, Jr., and J. G. Dworski.
Estuarine and Coastal Marine Science, Vol 11, No 5, p 515-536, November, 1980. 3 Fig, 6 Tab, 16 Ref.

Descriptors: *Model studies, *Estuaries, *Fluctuations, *Salinity, Mathematical studies, Velocity, Sampling, Water analysis, Circulation, Advection, Movement, Stratification, Profiles, Cross-sections, Gravity.

Three different sampling patterns were used to assess the transverse and vertical variations of parameters in an estuary cross-section. The sampling designs, which were based on the manner in which the total cross-section is broken up into sub-areas, were made up of uniform vertical spacing and proportional transverse spacing in Design I, proportional vertical spacing and uniform horizontal spacing in Design II, and uniform vertical spacing and uniform horizontal spacing in Design III. Three different hypotheses concerning the nature of the distribution were applied mathematically to test the designs. The model was applied to the Southampton Water, an estuary where both the salinity and velocity have important transverse and vertical variations. At Southampton Water, the longitudinal advective salt flux was found to be almost entirely due to the vertical variations in salinity and velocity. These findings were contrary to previous studies, and followed from the effect of gravity on the vertical stratification of both the salinity and velocity distributions. (Geiger-FRC)

SEASONAL VARIATION IN SPECIES COMPOSITION OF RECENTLY SETTLED FOULING COMMUNITIES ALONG AN ENVIRONMENTAL GRADIENT IN THE INDIAN RIVER LAGOON, FLORIDA,
Harbor Branch Foundation, Inc., Fort Pierce, FL.
D. Mook.
Estuarine and Coastal Marine Science, Vol 11, No 5, p 573-581, November, 1980. 4 Fig, 2 Tab, 29 Ref.

Descriptors: *Fouling organisms, *Aquatic animals, *Environmental gradient, Seasonal, *Lagoons, Invertebrates, Mollusks, *Indian River Lagoon(FL), Florida, Crustaceans, Annelids, Distribution patterns.

Fouling organisms were monitored monthly for a year in the Indian River Inlet, Florida, near the Fort Pierce Inlet, where salinity and temperature are relatively constant, and at points on a gradient approaching Vero Beach 16 km distant, where these parameters are more variable. The number of species was highest near the inlet and gradually decreased toward Vero Beach. Near the inlet, colonial species were dominant; further away from the inlet, eurytopic solitary forms prevailed. It is believed that the colonial species are better competitors for available space. WAVE INFLUENCES ON RIVER-MOUTH DEPOSITIONAL PROCESS: EXAMPLES FROM AUSTRALIA AND PAPUA NEW GUINEA,
Sydney Univ. (Australia). Dept. of Geography.
L. D. Wright, B. G. Thom, and R. J. Higgins.
Estuarine and Coastal Marine Science, Vol 11, No 3, p 263-277, September, 1980. 8 Fig, 24 Ref.

Descriptors: *Waves(Water), *Sediment transport, *Rivers, Deposition(Sediments), Deltas, Fluvial sediments, *Estuaries, Ocean waves, Surf, Currents(Water), Sand bars, Sedimentary structures, Rip currents, Littoral drift, Turbulence, Tidal effects, Sediment distribution, Sedimentation, Running waters, *Jaba River(New Guinea), Papua(New Guinea), *Shoalhaven River(Australia), Shoals, River flow, Coasts, Australia, New Guinea.

Patterns of sediment transport and deposition were observed at the river-sea interface of the Shoalhaven River, eastern Australian coast, and the Jaba River, Papua New Guinea. Although dissimilar in some ways, both river mouths are strongly influenced by wave processes. The generalities shared by both deltas, which can be attributed to wave action, are as follows: (1) the force of the breaking waves causes abrupt deceleration and lateral spreading of river water, resulting in a broad crescent-shaped bar within 2 channel widths seaward of the outlet, (2) turbid river water remains trapped on either side of the river mouth, (3) broad shoals capped by shoreward migrating swash bars are produced by wave reworking and steep lateral effluent velocity gradients, (4) sand is returned toward the shore, constricting the outlet, which is partially counteracted by friction between effluent and bar, (5) water flows away from the place of maximum deposition, then toward the sea in large-scale rips, which create delta-margin erosion and crescent-shaped embayments flanking the river mouth bulge, (6) estuarine conditions prevail under low and normal river stages, and wave activity helps flood tides transport sands upstream. These characteristics of wave-dominated river mouths are different from those of river mouths dominated by tides or the river flow. (Cassar-FRC)

DEVELOPMENT OF HOLLOW FIBER REVERSE OSMOSIS MEMBRANES,
Albany International Research Co., Dedham, MA.
D. K. Schiffer, C. E. Kramer, R. B. Davis, and M. J. Coplan.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-167215, Price codes: A03 in paper copy, A01 in microfiche. Final Report prepared for Office of Water Research and Technology, November, 1980. 32 p, 11 Fig, 7 Tab. OWRT-C-90266-D(No 9531)(1), 14-34-0001-9531.

Descriptors: *Reverse osmosis, *Composite membranes, *Membrane processes, *Desalination processes, Membranes, Semipermeable membranes, Desalination apparatus, Thin films.

Work conducted under this contract is a continuation of the development of a hollow fiber reverse osmosis composite membrane. Five systems (sulfonated polysulfone, piperazine phthalamide, immobilized zirconium, chemically bound tannins, and direct membrane formation) were investigated as replacements for the polyfuran membrane developed during contract 14-34-0001-7551. Sulfonated polysulfone was the most promising and enough membranes were prepared for testing in small module form at OWRT-Roswell. Testing indicates that SPS is a stable membrane with tolerance to

aggressive feeds, such as 50C seawater and pH 8, 100 ppm active chlorine.
W81-01652

SPARGED AIR DISTILLED WATER RECOVERY SYSTEM,
W. A. Rhodes.
U.S. Patent No 4,200,497, 5 p, 2 Fig, 14 Ref; Official Gazette of the United States Patent Office, Vol 993, No 5, p 1737, April 29, 1980.

Descriptors: *Patents, *Desalination, *Desalination apparatus, Separation techniques, Water purification, Distillation, Condensation, Desalination processes, Bubbles, Jets.

The invention relates to the distillation of water for purification purposes such as desalination and is concerned primarily with such a system in which sparged air is introduced into a body of water close to the surface where it generates bubbles which pass to the surface of the water and entrain vapor to form a mixture of air and water vapor which is conducted to a condenser from which distilled water is drained. The sparged air distilled water recovery system comprises a closed tank having spaced end walls. Passing through one end wall is a conduit that is connected at one end to a source of supply of water under pressure and terminating in a jet nozzle. An overflow drain is mounted in the opposite end wall and maintains substantially constant the level of water in the tank. A closed vapor and air circulating system extends from the end wall having the overflow drain to the end wall in which the jet nozzle is mounted. (Sinha-OEIS)

ION EXCHANGE PROCESS FOR DESALINATION,
Rohm and Haas Co., Philadelphia, PA. (Assignee).
H. Shimizu.
U.S. Patent No 4,202,737, 12 p, 4 Fig, 1 Tab, 5 Ref; Official Gazette of the United States Patent Office, Vol 994, No 2, p 616, May 13, 1980.

Descriptors: *Patents, *Water treatment, *Desalination, Desalination processes, Desalination apparatus, Ion exchange, Resins, Carbonates, *Heat regeneration.

An ion exchange process for desalination is described. A thermally regenerable ion exchange resin having weakly acidic free acid groups and weakly basic free base groups is carbonated, for example by contact with an H2CO3 solution, whereby the free base groups are converted to a carbonate form. The conversion may be effected either prior to or simultaneously with contact between the resin and the solution to be desalinated. Both fixed bed and continuous or semi-continuous resin systems are usable. The process maintains the desalination capacity at a high level while providing effective desalination. (Sinha-OEIS)
W81-01731

DEVELOPMENT OF IMPROVED CLEANING AND SURFACE REGNERATION METHODS AND ECONOMIC ANALYSIS OF THESE METHODS FOR SEAWATER MEMBRANES.
Burns and Roe Industrial Services Corp., Oradell, NJ.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-170607, Price codes: A06 in paper copy, A01 in microfiche. Report prepared for Office of Water Research and Technology, January 31, 1981. 104 p, 12 Fig, 14 Tab, 21 Ref, 3 Append. OWRT-C-90183-D(No 9524)(1), 14-34-0001-9524.

Descriptors: *Desalination, *Membrane processes, *Reverse osmosis, Seawater, Thin film composite membranes, Hollow fiber nylon membranes, Membrane regeneration.

Seawater membranes having deteriorated salt rejection through partial loss of the desalting layer are regenerated to approach their initial rejection through the application of chemical agents. The agents include water dispersible resins, surfactants, other colloids and organic acids. The effectiveness of a regenerating agent is a function of (1) type of membrane material; (2) initial level of salt rejection, and (3) flow conditions. At optimum additive concentration, the membrane quality parameter, A super 2/B increases. For an agent to sustain its effect for a long period, it should be capable of some specific interaction with the membrane such as hydrogen bonding. In all cases studied, it is cost effective to clean and regenerate rather than replace modules. However, in some cases, replacement is recommended.

DATA COLLECTION AND ANALYSIS OF COMMERCIAL MEMBRANE DESALINATION PLANTS--VOLUME I--SUMMARY,
DSS Engineers, Inc., Fort Lauderdale, FL.
S. Latour, J. Anderton, and J. Menningmann.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-170573, Price codes: A06 in paper copy, A01 in microfiche. Final Report to the Office of Water Research and Technology, Sept., 1980. 100 p, 15 Fig, 34 Tab. OWRT-C-80130-S(No 8531)(1), 14-34-0001-8531.

Descriptors: *Desalination, *Plant histories, *Electrodialysis, *Reverse osmosis, *Membrane processes, Hollow fibers, Composite R.O. membranes, Cellulose acetate membranes, Brackish water desalting, Operating costs, Raw water pretreatment.

This report is compiled in three volumes: I. Summary, II. Reverse Osmosis Plants; III. Electrodialysis/Electrodialysis Reversal Plants. Twenty-four commerical membrane desalination plants, ranging in size from 12,000 GPD to 5.0 MGD were surveyed including 14 reverse osmosis, 6 electrodialysis-reversal, and 4 standard electrodialysis facilites. Background information is presented on each plant's history and future plans; regarding water demand, feedwater supply, treatment options, and initial procurement. The design of each plant is documented with a piping and instrumentation diagram and an accompanying description of the initial and existing design as regards the feedwater supply, pretreatment, demineralization process, product/brine treatment, and the instrumentation and controls. An in-depth analysis of individual plant's operations and performance addresses major material failures, operating efficiences, and the membrane cleaning systems employed. Normalized production costs are developed from the stated consumption of the consumables used. Operator training and requirements are explained for each of the plants. Recommendations for more efficient operations are also offered.

3C. Use Of Water Of Impaired Quality

AQUACULTURE IN SOUTH EAST ASIA: SOME POINTS OF EMPHASIS,
Tamil Nadu Agricultural Univ., Tuticorin (India). Fisheries Coll.
M. N. Kutty.
Aquaculture, Vol 20, No 3, p 159-168, July, 1980. 1 Fig, 1 Tab, 33 Ref.

Descriptors: *Fish farming, *Recycling, *Waste disposal, Eutrophication, Nutrients, Commercial fishing, *Aquiculture, Sewage, Carp, Salmonids, Commercial shellfish, Asia, Food abundance, *India.

Some aspects of aquiculture in Asia are reviewed, with emphasis on the need for increased production of cheaper animal protein. The Eastern cultures have generally been more advanced in the commercial growing of aquatic species. Aquiculture is practiced in developing countries mainly to provide organisms to serve as food and to recycle organic wastes. The priorites of current aquiculture programs, which are supported by many international organizations, are discussed. The use of sewage as a nutrient source in fish culture systems has been practiced in several Asian countries. Controlled eutrophication has given high production rates with caged fish in Indonesian streams, and the

polyculture of carp has been tested in sewage-fed ponds in India. Fish raised on sewage must be examined thoroughly for pathogens before they are deemed fit for human consumption. Semi-cultural conditions of fish growing using oceans and man-made reservoirs may also be profitable. The abiotic factors affecting fish reproduction and growth must be carefully controlled. Behavioral patterns of fish should also be studied to optimize fish growth and prevent wasting of energy derived from food. Other areas of aquiculture that require further research are the genetic improvement of species used for breeding and fish food sources. (Geiger-FRC)

LONG-TERM EFFECTS OF IRRIGATION WITH WASTE WATER,
Utah Water Research Lab., Logan.
J. H. Reynolds, M. O. Braun, W. F. Campbell, R. W. Miller, and L. R. Anderson.
Journal of the Water Pollution Control Federation, Vol 52, No 4, p 672-687, April, 1980. 5 Fig, 12 Tab, 21 Ref.

Descriptors: *Irrigation water, *Irrigation effects, *Waste water irrigation, Effluents, Irrigation, Alfalfa, Municipal wastes, Coliforms, Heavy metals, On-site investigations, Phosphorus, Soil disposal fields, *Impaired water use.

A 24-month study to determine the long-term effects of applying secondary treated municipal effluent to land is reviewed. Data collected at a site irrigated with waste water effluent since 1957 was compared with data collected at a normal irrigation site. The waste water irrigation site was part of a slow-rate or crop-irrigation land application system. Parameters monitored on a monthly basis included: total coliforms, fecal coliforms, fecal streptococcus, various chemical properties, levels of various metals including heavy metals, and various organic compounds. Soil characteristics and plant characteristics were determined. The secondary treated municipal effluent was of significantly poorer quality than the normal irrigation water, but it was acceptable for crop irrigation. The treated site showed no accumulation of nitrogen, lead, copper, zinc, chromium, or cadmium. There was an increase in available phosphorus at the treated site, but there was no harmful accumulation of heavy metals in alfalfa grown there. There seemed to be no serious harmful effects as a result of long-term irrigation with waste water. (Small-FRC)

WATER REUSE: AN UNFINISHED AGENDA,
C. C. Johnson Associates, Silver Spring, MD.
C. C. Johnson, Jr.
Environmental Science & Technology, Vol 14, No 11, p 1304-1306, November, 1980.

Descriptors: *Water reuse, *Conferences, Groundwater recharge, Public health, Virginia, Water quality, Reclamation, Recharge, Reclaimed water, Potable water, Water purification, Infiltration.

An EPA Symposium on Protocol Development was held in Virginia, July 29-31, 1980 to develop criteria and standards for potable water reuse and non-potable options. The meeting sought to recommend basic principles that could be used in the decision-making process and specify experiments which could be used to help answer the questions that still exist concerning potable water reuse. The symposium was attended by toxicologists, engineers, chemists, groundwater specialists, microbiologists and researchers in the field of non-potable options. Key issues centered around the reuse of water due to shortages in potable supplies and the need for overall protection of public health. Deliberations among the workshop members focussed on formal charges to consider the source of the water, its quality, treatment alternatives, and monitoring needs. Water reuse programs are currently in operation in many foreign nations and on an experimental basis in Virginia. Groundwater recharge programs are essentially water reuse programs. Unplanned reuse occurs when treatment plant intakes exist just downstream of waste water treatment plant discharge sites. Most of the symposium working groups agreed that the problems of potable reuse were not insurmountable, and it could be achieved with updated technology. It was also concluded that more research was needed on the transport of pathogens, metals, and organics in groundwater recharge and other water reuse systems. (Geiger-FRC)

BACKWASH WATER RECYCLING SYSTEM,
PepsiCo., Inc., Purchase, NY. (Assignee).
H. C. De Longe, and W. S. Fabian.
U.S. Patent No 4,202,768, 6 p, 1 Fig, 5 Ref; Official Gazette of the United States Patent Office, Vol 994, No 2, p 625, May 13, 1980.

Descriptors: *Patents, *Water treatment, *Industrial water, *Water reuse, Filtration, Water quality control, Recycling, *Backwashing, Holding tanks.

A process and apparatus for the treatment of the aqueous backwash effluent resulting from a backwashing operation of an industrial filter are described. During the backwashing operation, particulate matter and solids are dislodged from the industrial filter so as to be entrained in the backwash effluent, and the effluent is passed through a backwash filter to remove these materials. After passing through the backwash filter, the normally water-based backwash solution is directed to a holding tank for storage until a subsequent backwashing operation is required. The pH value and chlorination level of the backwash solution are periodically adjusted to maintain them within selected ranges in order to optimize the sanitizing effect of the solution during the backwashing operation. The process and apparatus results in the consumption of a much smaller quantity of water than prior arrangements wherein a single use backwash solution is dumped into the general effluent discharge of the plant. SELF-PROPELLED IRRIGATION SYSTEM,
E. Stenild.
U.S. Patent No 4,201,343, 6 p, 3 Fig, 3 Ref; Official Gazette of the United States Patent Office, Vol 994, No 1, p 146, May 6, 1980.

Descriptors: *Patents, *Irrigation systems, Sprinkler irrigation, *Application equipment, Mechanical equipment, Irrigation operation and maintenance, Irrigation efficiency.

A self-propelled irrigator has a water-driven rotor carrying spray nozzles and a reel driven by the rotor for winding up a rope for moving the irrigator over the ground. The reel is driven by a transmission including a ratchet wheel, the teeth of which are successively hit by an impact member on the rotor. The rotor functions as an energy-accumulating flywheel, and every time the stop member hits a tooth on the ratchet wheel, some of the accumulated rotatory energy is supplied to the power transmission, which drives the reel upon which the rope is wound. Since the free end of the rope is secured to a fixed point, the irrigator is with great force pulled smoothly forward, thereby ensuring uniform irrigation. (Sinha-OEIS)

SHIFTABLE STATOR SPRINKLER HEAD,
Toro Co., Riverside, CA. (Assignee).
L. J. Lichte.
U.S. Patent No 4,201,344, 8 p, 8 Fig, 8 Ref; Official Gazette of the United States Patent Office, Vol 994, No 1, p 146, May 6, 1980.

Descriptors: *Patents, *Irrigation, *Sprinkler irrigation, *Application equipment, Nozzles, Irrigation operation and maintenance, Irrigation efficiency.

A reversible turbine-driven sprinkler head includes a vaned turbine motor for rotatably driving a nozzle. The turbine is unresponsive to the normal flow of fluid through the sprinkler head to the nozzle. Switchable deflection means are included for deflecting the flow of fluid through the body against the turbine to cause rotation in either of two directions. By deflecting the fluid flow to cause the turbine to rotate in one direction, the nozzle is rotated in one direction. By switching the direction of fluid deflection to cause the turbine to flow in the opposite direction, the nozzle is rotated in the opposite direction. Adjustable means are provided for setting the positions relative to the rotation of the nozzle whereas the deflection of the fluid flow is reversed, whereby the nozzle is caused to repeatably oscillate between a first and a second position. (Sinha-OEIS)

CENTER PIVOT IRRIGATION SYSTEM WITH SLINGER-TYPE SPRINKLER MEANS,
L. F. Knudsen.
U.S. Patent No 4,202,596, 6 p, 7 Fig, 5 Ref; Official Gazette of the United States Patent Office, Vol 994, No 2, p 572, May 13, 1980.

Descriptors: *Patents, *Irrigation systems, *Sprinkler irrigation, Application equipment, Irrigation efficiency, Irrigation operation and maintenance.

A mobile irrigation system includes an elongated horizontal water conduit assembly having spaced support structures. One end of the water conduit assembly is connected with a source of water under low pressure and discharge pipes are supported from the assembly at spaced points. They open upwardly and outwardly from the interior of the conduit assembly. Motor driven generally horizontal and centrally apertured discs are journaled from the assembly and the discharge pipes project upwardly through the central apertures in the discs. The upper end portions of the discharge pipes include generally horizontal outwardly opening outlet portions for discharging low pressure water. The disc includes upstanding water slinger vanes spaced from each other for engaging and angularly accelerating the water discharged onto the discs upon rotation of the latter. The outer ends of the vanes are contoured to discharge the accelerated water at high velocity. (Sinha-OEIS)

Measurement of water flow in irrigation practice is reviewed. Attention is given to the simplest and most inexpensive methods that can be used for the accurate determination of flow rate of water as applied in agriculture. Covered are gravimetric and volumetric methods, the measurement of flow rates in vertical and horizontal pipes, the siphon pipe method, commerically-available hydrometers, and the orifice plate method. Design criteria are provided for the various hydrometry methods, along with seven practical examples (and their solutions) to illustrate the use of the conversion tables provided. (Zielinski-IPA)

SUCCESSFUL MICRO-IRRIGATION IN ZULULAND,
Llanwarne Estates, Zululand (South Africa).
W. Koekemoer.
The Citrus and Subtropical Fruit Journal (Johannesburg), No 549, p 14-15, August, 1979.

Descriptors: *Irrigation practices, *Irrigation efficiency, *Africa, *Irrigation effects, Irrigation design, Crop response, Crop production, Infiltration, Irrigation, Watering, Effects, Farm management, Trees, Fruit crops, Orchards, Plant groupings, Profit, Costs, Economic efficiency, Benefits, Cultivation, Cultivated lands, Mechanical control, Planting management, *Zululand(Africa).

Micro-irrigation is considered an instrument to ensure maximum profit in the cultivation of trees. The first system was installed in 1974. Nineteen advantages of this system (micro-irrigation) over conventional methods of irrigation (flood irrigation and dragline) have been enumerated and discussed. Water and labor savings are made, new plantings come into production sooner, and larger production (easily, 10%) is noted. The method extends tree life (over-irrigation causes root-rot), diminishes appearance of creasing, burst fruit and thick skins, and has low maintenance costs (no moveable parts; uses buried pipes). Other advantages include: erosion prevention; performance of other orchard activities (spraying, fertilizing, picking) during micro-irrigation; facilitated weed control (only the section under the tree gets water); independent of soil structure or ground grade; even blooming; and provides convenient locations of filling points for spray application. Also, fertilizers can be applied through micro-irrigation and windbreaks can be supplied with water from microjets at no real extra cost. Since the tree is supplied with sufficient water continuously, its metabolic process function is undisturbed. (Zielinski-IPA)

SPRING SOIL WATER, PRECIPITATION, AND NITROGEN FERTILIZER: EFFECT ON BARLEY YIELD,
Department of Agriculture, Lethbridge (Alberta). Research Station.
J. B. Bole, and U. J. Pittman.
Canadian Journal of Soil Science, Vol 60, No 3, p 461-469, August, 1980. 2 Fig, 3 Tab, 17 Ref.

Descriptors: *Soil water, *Precipitation, *Nitrogen fertilizer, *Yield equations, *Barley, Crop production, Fertilizers, Rainfall, Model studies, On-site investigations, Irrigation, Mathematical studies, Nitrogen compounds, Water conservation.

A regression model (R=0.94) based on results of a 5-year field study was used to describe barley yield as a function of available soil water in the spring (WS), growing season precipitation (GSP), and N fertilizer. The study was undertaken to synchronize fertilization with optimum soil water conditions in order to minimize the use of irrigation water later on in the growing season. Barley yields on plots with WS and GSP levels within the scope of the data used to derive the equation were similar to yields predicted by the model. WS was based on soil water measured on May 15 or June 1, and GSP was measured for the period extending from June 1 to July 31. When rainfall occurring after July 31 was included in the data, the accuracy of the model sharply decreased. GSP and WS had a similar effect on yield at the GSP levels occurring in the study. However, when the long-term average GSP and WS levels recorded at Lethbridge were used, WS was only about half as effective as GSP on stubble, and one-third as effective on summer fallow. GSP was three times more effective on barley response to N fertilizer than WS. A farmer may use the model to determine optimum rates of N fertilization based on a gravimetrically determined WS level at seeding, with the GSP probability representing risk levels when the current cost: price ratio for N fertilizer and barley are known. SPRING SOIL WATER, PRECIPITATION, AND NITROGEN FERTILIZER: EFFECT OF BARLEY GRAIN PROTEIN CONTENT AND NITROGEN YIELD,
Department of Agriculture, Lethbridge (Alberta). Research Station.
J. B. Bole, and U. J. Pittman.
Canadian Journal of Soil Science, Vol 60, No 3, p 471-477, August, 1980. 2 Fig, 2 Tab, 17 Ref.

Descriptors: *Soil water, *Yield equations, *Proteins, Precipitation, *Barley, *Nitrogen yield, Fertilizers, Nitrogen compounds, Irrigation, Mathematical studies, Crop production, Rainfall, Water conservation, Model studies, On-site investigations, Absorption, Nitrogen.

Cereal protein levels are affected by N fertilization and the amount of available moisture. A five year study was undertaken to derive a mathematical expression relating barley protein content and N uptake to stored soil water and precipitation, and to optimize fertilization and planting time to conserve the amount of irrigation water required later on in the growing season. Barley protein content and yield were mathematically described as a function of available soil water before seeding (Ws), growing season precipitation (GSP), and fertilizer N level (N). Ws values were calculated from data derived from fall irrigation practices and from fields prepared by covering plots with polyvinyl chloride sheets to exclude fall and winter precipitation and snowmelts. N rates increased protein content greatly when Ws was low. With 100-180 kilograms N/ha and Ws values of less than 100 mm, protein contents of 15-19% were achieved. If Ws was over 150 mm, then N rates greater than 100 kilograms/ha could be used. When Ws was less than 100 mm, protein content could only be maintained below the maximum level for malting barley by restricting N rates to 20-50 kilograms/ha. Protein content was not affected by GSP levels in this study. Although barley grain N yield ranged from negligible levels to over 100 kilograms/ha, in general the incremental N yield was less than 30% of the rate of N applied during fertilization. (Geiger-FRC)

WATER-USE EFFICIENCY OF TRANSPLANTED AND DIRECT-SOWN RICE UNDER DIFFERENT WATER-MANAGEMENT PRACTICES,
Indian Agricultural Research Inst., New Delhi.
S. B. Hukkeri, and A. K. Sharma.
Indian Journal of Agricultural Sciences, Vol 50, No 3, p 240-243, March, 1980.

Descriptors: *Rice, *Rice transplanting, *Irrigation efficiency, Water management, Irrigation practices, Submergence, Planting management, Water resources, Efficiency, *India, Cereal crops.

Rice was grown on sandy clay loam soils at Delhi, India, during the wet seasons of 1972 and 1973. Transplanting was the most water-efficient method of the 5 planting treatments tried. It produced the largest crop and used less water, 183 cm per year, than the 4 direct sowing methods, 219 to 234 cm per year. Three water management methods were tried. Submergence for almost the entire growth season using 262 cm of water yielded the best crop, but required the most water. The other two methods produced almost as much grain but with greatly reduced water use. The method using intermittent submergence only during critical stages of tillering and flowering used 164 cm of water. The most water efficient practice combined transplanting with minimum submergence. A good alternative method for areas and seasons with ample water resources was the direct seeding with sprouted seeds on puddled soil. (Cassar-FRC)

AQUATIC WEED CUTTER, DE-ROOTER AND HARVESTER,
E. G. Stewart.
U.S. Patent No 4,202,155, 12 p, 6 Fig, 11 Ref; Official Gazette of the United States Patent Office, Vol 994, No 2, p 418, May 13, 1980.

Descriptors: *Patents, *Aquatic weeds, *Aquatic weed control, Channel improvement, Equipment, Weed cutters.

An apparatus for cutting, de-rooting and harvesting of aquatic weed growth is disclosed. The apparatus is of modular construction for ease of land transportation and includes a cutting and de-rooting head assembly which is carried by extensible framing for proper positioning on the bed of a river or lake. The head assembly has weed severing means and scribbing, polishing means in the form of vortex generators and may include lake bed scarifying means to assist in de-rooting weed growth. Cut weeds and weed fragments are contained in a vertically extensible curtain containment chamber from which they are loaded into a trailing hopper. The problems of turbidity, cut weed collection and fragment containment are overcome by providing a retractible containment curtain which envelops the working head and frame extender assemblies and leads the cut weeds and fragments to a collecting beltless conveyor and a spill-over fragment trap. INVESTIGATIONS OF SMALL, MAN-MADE IMPOUNDMENTS ON THE HYDROLOGY OF THE LOWER OAK CREEK DRAINAGE AREA, COCONINO AND YAVAPAI COUNTIES, ARIZONA,
Northern Arizona Univ., Flagstaff. Dept. of Geology.
L. D. Agenbroad, D. M. Best, and C. C. Avery.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-173775. Technical Report, January, 1981. 68 p, 7 Fig, 4 Tab, 14 Ref, 1 Append. OWRT-A-102-ARIZ(1).

Descriptors: *Drainage area, *Drainage engineering, Drainage wells, *Impoundments, *Flood protection, Floodwater, Groundwater reservoirs, Drainage, Drainage systems, Drainage basins, Drainage effects, Drainage districts, Arizona, Controlled drainage, Civil engineering, Construction equipment, Flow, Drainage density, Drainage water, *Stock water, Hydrology, Impounded waters, Flow system, Engineering structures, Groundwater recharge.

The Lower Oak Creek drainage area in north-central Arizona covers about 240 square miles, and presently contains 93 stock tanks having a potential capacity of almost 230 acre-feet. These tanks recharge the local groundwater and also serve to impede flood pulses that eventually make their way into the Salt River and thus pass through the metropolitan Phoenix area. Anomalous wet month (December-March) precipitation during 1978-1980

resulted in extensive flooding in central Arizona (especially to the south). It was concluded that stock tanks can have a definite effect on diminishing the results of such flooding by allowing for water to be retained and to be slowly seeped into the subsurface. Hence, these tanks play a significant role in the overall groundwater hydrology of the drainage area. Increased construction of such tanks and their appropriate placement in the Oak Creek watershed and surrounding drainage areas could play a key role in minimizing downstream effects of future flooding events. POTENTIAL FOR USING THE UPPER COACHELLA VALLEY GROUND-WATER BASIN, CALIFORNIA, FOR STORAGE OF ARTIFICIALLY RECHARGED WATER,
Geological Survey, Menlo Park, CA. Water Resources Div.
M. J. Mallory, L. A. Swain, and S. J. Tyley.
Available from the OFSS, USGS Box 25425, Fed. Ctr. Denver CO 80225, Price: $3.25 in paper copy, $3.50 in microfiche. Geological Survey Open-File Report 80-599, September, 1980. 23 p, 10 Fig, 14 Ref.

Descriptors: *Artificial recharge, *Groundwater basins, *Water storage, *California, Groundwater resources, Water table, Water quality, Water management(Applied), Evaluation, *Coachella Valley(CA), State Water Project(CA).

This report presents a preliminary evaluation of the geohydrologic factors affecting storage of water by artificial recharge in the upper Coachella Valley, Calif. The ground-water basin of the upper Coachella Valley seems to be geologically suitable for large-scale artificial recharge. A minimum of 900,000 acre-feet of water could probably be stored in the basin without raising basinwide water levels above those that existed in 1945. Preliminary tests indicate that a long-term artificial recharge rate of 5 feet per day may be feasible for spreading grounds in the basin if such factors as sediment and bacterial clogging can be controlled. The California Department of Water Resources, through the Future Water Supply Program, is investigating the use of ground-water basins for storage of State Water Project water in order to help meet maximum annual entitlements to water project contractors. GROUND WATER IN THE THOUSAND OAKS AREA, VENTURA COUNTY, CALIFORNIA,
Geological Survey, Menlo Park, CA. Water Resources Div.
J. J. French.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-113235, Price codes: A03 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 80-63, August, 1980. 40 p, 12 Fig, 5 Tab, 14 Ref.

Descriptors: *Groundwater, *Groundwater basins, *Water management(Applied), *Urbanization, *California, Groundwater resources, Aquifers, Hydrogeology, Water wells, Water yield, Water levels, Drawdown, Groundwater movement, Water demand, Irrigation, Artificial recharge, Imported water, Water quality, Chemical analysis, Ventura County(CA), Thousand Oaks(CA), Conejo Valley(CA).

The ground-water basin beneath the city of Thousand Oaks, Calif., corresponds closely in area with the surface-water drainage basin of Conejo Valley. Before World War II there was little ground-water development. After World War II, urban development put a stress on the ground-water basin; many wells were drilled and water levels in wells were drawn down as much as 300 feet in places. Beginning in 1963, imported water replaced domestic and municipal ground-water systems, and water levels rapidly recovered to predevelopment levels or nearly so. Most of the ground water in the Thousand Oaks area is stored in fractured basalt of the middle Miocene Conejo Volcanics. Depending on the degree of occurrence of open fractures and cavities in the basalt, recoverable ground water in the upper 300 to 500 feet of aquifer is estimated to be between 400,000 and 600,000 acre-feet. The yield of water from wells in the area ranges from 17 to 1,080 gallons per minute. Most of the groundwater in the eastern part of the valley is high insulfate and has a dissolved-solids concentration greater than 1,000 milligrams per liter. In the western part of the valley the ground-water is mostly of a bicarbonate type, and the dissolved-solids concentration is less than 800 milligrams per liter. In most areas of Conejo Valley, ground-water is a viable resource for irrigation of public lands and recreation areas. (USGS)

Sources of the Dunkirk, France, raw water supply have been diversified and expanded by installing 2 basins for recharging of surface water from the Moulle treatment plant. The recharge is programmed by mathematical model as a function of rainfall and different output flows. In addition, water is pumped from the Bourbourg Canal to the original aquifer supply. After 1990, it is planned to take surface water from a canal and store it in a 211 million gallon basin for later treatment and distribution. (Cassar-FRC)

4C. Effects On Water Of Man's Non-Water Activities

URBAN RUNOFF MANAGEMENT STRATEGIES,
Pennsylvania State Univ., University Park. Dept. of Civil Engineering.
D. F. Kibler, and G. Aron.
Journal of the Technical Councils of ASCE, Proceedings of the American Society of Civil Engineers, Vol 106, No TC1, Proc. Paper 15600, p 1-12, Aug. 1980, 3 Fig, 4 Tab, 22 Ref. OWRT-A-049-PA(2), 14-34-0001-9040.

Descriptors: *Urban runoff, Downstream, *Hydrology, Land use, Watersheds, Abatement, Drainage, Hydrographs, Groundwater recharge, Peak discharge, Mathematical models, *Flow control, *Upstream control, *Runoff abatement, Hydraulic simulation, Hydrologic models.

A dramatic shift has occurred in the control of urban runoff over the past 10 to 15 years. The conventional practice of rapid removal and delivery of urban runoff to downstream areas is being replaced by the newer concept of reduction and detention of urban runoff in upstream source areas. A successful strategy for managing urban runoff must be based on: (1) application of proper hydrologic tools for the analysis of urban runoff under alternative land-use conditions in the watershed; (2) hydrologic and economic evaluation of the performance of alternative runoff abatement measures; and (3) projection of downstream impacts of selected abatement schemes. The purpose of this paper was to review these basic elements in urban runoff management and to comment on future directions in this evolving field.

OBSERVATIONS ON KINEMATIC RESPONSE IN URBAN RUNOFF MODELS,
Pennsylvania State Univ., University Park. Dept. of Civil Engineering.
D. F. Kibler, and G. Aron.
Water Resources Bulletin, Vol 16, No 3, p 444-452, June 1980, 12 Fig, 4 Tab, 6 Ref. OWRT-A-049-PA(3), 14-34-0001-9040.

Descriptors: *Urban runoff, *Model studies, *Storm water, *Hydrographs, Watersheds, Overland flow, Infiltration, Gages, Drainage, Synthetic hydrology, *Kinematic response, Sensitivity analysis, Parameters, Catchment, Hydraulics.

The results of sensitivity analyses conducted on various parameters of the San Francisco Stormwater Model (a version of WREM) and the Penn State Runoff Model in terms of their impact on outflow hydrographs are discussed. The parameters considered within an idealized catchment included: basin shape, impervious fraction, overland roughness and slope; detention depth; infiltration capacity; and hyetograph timing. The results for the hypothetical catchment were extended to the Izzard laboratory surfaces (asphalt, grass, roofing material) as a means of illustrating the need for changes in model structure, as opposed to continued parameter adjustment. The effects of altering the scale of hydraulic representation in the surface runoff and sewer transport calculations were demonstrated for two gaged watersheds in Hamburg, West Germany.

RIVER MANAGEMENT IN THE URBAN ENVIRONMENT,
R. D. Beaumont.
Imiesa (Johannesburg), Vol 4, No 6, p 25, 27, 29, June, 1979. 7 Fig.

Descriptors: *Urban runoff, *Urbanization, *Channel improvement, *Flood plains, *River flow, River regulation, Streamflow, Urban drainage, Runoff, Storm runoff, Community development, Land use, Urban mapping, City planning, Floods, Floodflow, Flow, Flood control, Floodways, Drainage systems, Watershed(Basins).

The effects of urban development on the natural stability of river systems are discussed in connection with increased runoff, channel stability, and the flood plain. Urbanization results in a greater runoff increase for smaller and more common storms than for larger and less frequent ones. In an urban environment, concreting channels and widening of channels enhance channel stability, but urbanization can also reduce groundwater and dry weather flows that adversely affect vegetal cover along river banks. Townships built close to river banks were susceptible to flooding from increased upstreams runoff, which construction would be restricted by current legislation. Legislative aspects covered (1978 Water Amendment Act requires that development plans of certain townships show the 20-year flood line, but not development constraints) and not covered (interrelation between urban upstream catchment development and

downstream flooding). The basic choice between natural/man-made channels is largely dependent on capital/maintenance costs and their benefits/constraints. (Zielinski-IPA)

EVALUATION OF MANGEMENT PRACTICES ON THE BIOLOGICAL AND CHEMICAL CHARACTERISTICS OF STREAMFLOW FROM FORESTED WATERSHEDS,
Pennsylvania State Univ., University Park. School of Forest Resources.
J. A. Lynch, E. S. Corbett, and W. E. Sopper.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-170524, Price codes: A06 in paper copy, A01 in microfiche. Institute for Research on Land and Water Resources, Pennsylvania State University, Research Project Technical Completion Report, November, 1980, 107 p, 33 Fig, 24 Tab, 50 Ref. OWRT-A-041-PA(1), 14-34-0001-1140.

Descriptors: *Forest watersheds, *Streamflow, *Clearcutting, Herbicides, *Water quality, Vegetation, Analysis, Stress, Nutrients, Turbidity, Sediments, Aquatic life, Ecosystems, Water yield, Peak discharge, Stream gages, Watershed management, Environmental effects, Chemical characteristics, Biological characteristics, Response, Stormflow parameters.

A 106-acre oak-hickory experimental watershed in central Pennsylvania was clearcut in three phases to evaluate the effects of the clearcuts on the physical, chemical, and biological properties of streamflow. Herbicides were used to control the regrowth of vegetation so that groundwater conditions on the clearcuts would be similar for each phase analysis, and also to quantify maximum response and stress factors. The watershed response to these treatments was characterized by measuring changes in streamflow amounts and timing, stormflow parameters, streamwater temperature, nutrient concentrations, turbidity and sediment, and aquatic macroinvertebrate populations. Biologic implications for the aquatic ecosystem are presented on the basis that each aquatic organism has a particular set of environmental conditions and habitat preferences that are optimal for its maintenance.

4D. Watershed Protection

REVEGETATION OF MINED LAND USING WASTE WATER SLUDGE,
Pennsylvania State Univ., University Park. Inst. for Research on Land and Water Resources.
W. E. Sopper, and S. N. Kerr.
Public Works, Vol 111, No 9, p 114-116, September, 1980. 2 Fig.

Descriptors: *Land reclamation, *Strip mines, *Sludge, Land management, *Revegetation, Soil erosion, Reclamation, Agricultural engineering, Spoil banks, Strip mine wastes, Coal mine wastes.

Both liquid and dewatered sludge products were obtained from local treatment plants and spread on strip mine spoil banks in efforts to reclaim the land. Dewatered sludge was applied with farm manure spreaders at a rate of 40 and 82 dry tons per acre. Immediately after sludge application and incorporation, the site was broadcast seeded with a mixture of two grasses and two legumes. The seeding mixture was Kentucky-31 tall fescue, Pennlate orchardgrass, Penngift crownvetch and Empire Birdsfoot trefoil. The two grass species will germinate quickly and provide a complete protective cover the first year, allowing time for the two legume species to become established and develop into the final vegetative cover. Results of a subsequent monitoring program demonstrated that no harmful effects had occurred as a result of applying the sludge to the ground in the land reclamation project. Even after the third year there was no apparent deterioration of the vegetative cover in any of the sludge-treated areas. Two additional examples of the use of sludge for starting vegetative covers in land reclamation efforts are noted. (Baker-FRC)

REVEGETATION PROJECT UTILIZES SLUDGE,
Colorado School of Mines, Golden.
B. Farquhar.
Public Works, Vol 111, No 7, p 67-68, July, 1980. 2 Fig.

Descriptors: *Land reclamation, *Mining, *Sludge, Land management, Soil erosion, Reclamation, Agricultural engineering, *Revegetation, Colorado.

The AMAX Urad Mine project in central Colorado, a land reclamation project based on the use of sludge for revegetation, is described. The Urad Molybdenum Mine is located near the foot of Berthoud Pass and US Highway 40 and was closed in 1974 after producing 48 million pounds of molybdenum concentrate and 14 million tons of ore. The problem of revegetation of the mill tailings waste product was solved by using three other waste products - rock waste from a nearby mine, waste water treatment plant sludge, and wood chips. The rock mulch provided an ideal mulch. The wood chips bound much of the nitrogen, bringing the levels down to acceptable ones for young plants. The wood also fixes the nitrogen in the humus for future plant use. The site was provided with 20 tons per acre each of sludge and wood chips, followed by an additional 10 tons of sludge per acre three years later. The use of inorganic fertilizers will maintain the vegetation permanently. The Urad reclamation project will cost between 6 and 7 million dollars when completed. (Baker-FRC)

5. WATER QUALITY MANAGEMENT AND PROTECTION

5A. Identification Of Pollutants

SALMONELLA SURVIVAL IN FRESHWATER AND EXPERIMENTAL INFECTIONS IN GOLDFISH (CRASSUIS AURATUS),
Purdue Univ., Lafayette, IN. Dept. of Microbiology, Pathology and Public Health.
R. L. Lawton, and E. V. Morse.
Journal of Environmental Science and Health, Vol A15, No 4, p 339-358, 1980. 5 Tab, 16 Ref. OWRT B-076-IND(7).

Descriptors: *Salmonella, *Aerobic bacteria, *Sewage bacteria, Pollution, Fish diseases, Infection, Bottom sediments, Bacteria, Physiological ecology, *Pollutant identification.

The infection rates for various Salmonella serotypes in goldfish (Crassuis auratus) were evaluated under a number of controlled environmental conditions. Studies were undertaken to determine the number of salmonellae necessary to cause infection, and to elucidate the conditions instrumental to the continued persistence of the pathogen in the aquatic environment. All of 32 strains (representing 12 serotypes of Salmonella) studied infected goldfish. Under appropriate physiological conditions, the fish were infected for a period of two weeks with less than or equal to 5 organisms/ml water. Physiological stress to the fish augmented infection rates. Increased eutrophy, with agitation of the water, was correlated with lowered infection rates and decreased survival of the pathogen. The presence of a bottom sediment under these same eutrophic conditions resulted in infections of six weeks duration. Repeated isolation of salmonellae from the gastrointestinal tracts of the fish suggested that colonization had occurred. A cycle of reinfection, i.e. fish to water to fish, may have taken place. Thus the fish may have contributed an important element for the persistence of Salmonella in freshwater. Salmonella may be used as monitors of fecal pollution in the aquatic biosphere. These bacteria, when present in native fishes may also be retrospective indices of fecal pollution. The presence of Salmonella in any body of water raises serious questions as to water quality and safety for both man and livestock.
W81-01655

EFFECTS OF RESIDENCE IN FISHES UPON THE PATHOGENICITY OF SALMONELLA SEROTYPES FOR LABORATORY WHITE MICE,
Purdue Univ., Lafayette, IN. Dept. of Microbiology, Pathology and Public Health.
E. V. Morse, K. A. Gossett, and M. A. Duncan.
Journal of Environmental Science and Health, Vol A15, No 4, p 359-371, 1980. 4 Tab, 16 Ref. OWRT B-076-IND(6).

Descriptors: *Salmonella, *Aerobic bacteria, *Water pollution, Pathogenicity, Fish diseases, Infection, Laboratory tests, White mice, Analytical techniques, Cultures.

Increasing evidence indicates that freshwater fishes may be naturally and experimentally infected with Salmonella and may harbor the pathogen for more than 100 days. The effects upon the pathogenicity of various serotypes for white mice following residence in freshwater fishes was evaluated. Virulence patterns of serotypes cultured from fish were compared with the same serotypes cultured from man and lower animals. LD sub 50 and ID sub 50 values for the respective isolates were ascertained following intraperitoneal injection of mice. With the exception of 1 strain of S. typhimurium, var. Copenhagen (a smooth (S) phase culture, which rapidly mutated to the rough (R) state) there was no evidence of attenuation or loss of virulence of the serotypes. Results of the study indicate that residence or colonization in poikilotherms has no marked effect on pathogenicity for homoeiothermic hosts.
W81-01657

DISTRIBUTION OF NITRATE IN THE UNSATURATED ZONE, HIGHLAND-EAST HIGHLANDS AREA, SAN BERNARDINO COUNTY, CALIFORNIA,
Geological Survey, Menlo Park, CA. Water Resources Div.
J. M. Klein, and W. L. Bradford.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-117004, Price codes: A05 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 80-48, September, 1980. 70 p, 20 Fig, 16 Tab, 100 Ref.

Descriptors: *Nitrates, *Groundwater, *Artificial recharge, *Aquifer management, *California, Nitrogen, Ion exchange, Irrigation effects, Water pollution sources, Water pollution control, Water quality, Chemical analysis, *San Bernardino County(CA).

In the vicinity of Highland-East Highlands, San Bernardino County, Calif., plans to recharge local aquifers with imported water would raise the water table and intercept nitrogen in the unsaturated zone. Samples from 13 test holes were analyzed to ascertain the distribution of nitrate and related inorganic nitrogen species and other water-quality characteristics. Test holes were ranked according to maximum NO3(-)-N in the top 10 feet, total NO3(-)-N in the top 10 feet, and total NO3(-)-N in the top 40 feet. In all three rankings, the top seven test holes were the same--five in or near past or present agricultural areas (primarily citrus groves), one in a feedlot, and one adjacent to an abandoned sewage-treatment plant. Two test holes in uninhabited areas ranked lowest. The control test hole ranked high in geometric mean ammonium nitrogen, suggesting that NH4(+)-N is present in freshly weathered granite. The geometric mean NH4(+)-N concentrations in six of eight test holes in citrus-related areas were significantly lower than in the control hole. High NO3(-)-N concentrations tended to be found with high specific conductance and chloride concentrations. If recharge is carried out as planned, assuming complete mixing of the recharge water and interstitial pore water in the top 20 feet of the saturated zone, NO3(-)-N concentrations in water at the top of the saturated

zone may exceed 10 milligrams per liter in seven areas studied. (USGS)

SULFATE REDUCTION IN GROUND WATER OF SOUTHEASTERN MONTANA,
Geological Survey, Helena, MT. Water Resources Div.
W. S. Dockins, G. J. Olson, G. A. McFeters, S. C. Turbak, and R. W. Lee.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-221971, Price codes: A02 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 80-9, February, 1980. 13 p, 3 Fig, 2 Tab, 16 Ref.

Descriptors: *Sulfur bacteria, *Groundwater, *Anaerobic bacteria, *Geochemistry, Montana, Analytical techniques, Stable isotopes, Sampling, Sites, Hydrologic data, *Southeastern Montana, Northern Powder River basin(MT), *Sulfate-reducing bacteria.

Ground waters in southeastern Montana were investigated to determine if sulfide production was bacterially mediated. Sulfate-reducing bacteria were detected in 25 of 26 groundwater samples in numbers ranging from 20 to greater than 24,000 bacteria per 100 milliliters for those samples containing bacteria. Stable sulfur isotope fractionation studies indicate a biological role in sulfate reduction. However, sulfate-reducing activity as determined by use of a radioactive sulfur isotope was observed in only 1 of 16 samples. Bacterial dissimilatory sulfate reduction is postulated to be responsible for a major part of the sulfide produced in these ground waters. These bacteria are most likely active in the adsorbed state, possibly in subsurface microzones where environmental conditions are conducive to sulfate reduction. (USGS)

Descriptors: *Water quality, *River basins, *Water pollution, *North Carolina, Water pollution effects, Water analysis, Regression analysis, Dissolved oxygen, Dissolved solids, Specific conductivity, Trace elements, Nutrients, Coliforms, Phytoplankton, Coastal Plains, Neuse River(NC).

A water-quality study of the Neuse River, N.C., based on data collected during 1956-77 at the U.S. Geological Survey stations at Clayton and Kinston, employs statistical trend analysis techniques that provide a framework for river quality assessment. Overall, water-quality of the Neuse River is satisfactory for most uses. At Clayton, fecal coliform bacteria and nutrient levels are high, but algae and total-organic-carbon data indicate water-quality improvement in recent years, due probably to a new wastewater treatment plant located downstream from Raleigh, N.C. Pollution was determined by subtracting estimated natural loads of constituents from measured total loads. Pollution makes up approximately 50% of the total dissolved material transported by the Neuse. Two different data transformation methods allowed trends to be identified in constituent concentrations. The methods recomputed the concentrations as if they were determined at a constant discharge over the period of record. Although little change since 1956 can be seen in most constituents, large changes in some constituents, such as increases in potassium and sulfate, indicate that the water quality of the Neuse River has noticeably deteriorated. Increases in sulfate are probably largely due to increased long-term inputs of sulfur compounds from airborne pollutants. (USGS)

PREDICTING SAFE CONCENTRATIONS OF VOLATILE ORGANIC SUBSTANCES IN DISCHARGES TO SEWERS,
Water Pollution Research Lab., Stevenage (England).
B. J. Borne, and J. A. Hobson.
Progress in Water Technology, Vol 12, No 3, p 77-82, 1980. 3 Tab, 1 Ref.

Descriptors: Sewage, *Vapor pressure, *Toxicity, Volatility, Laboratory tests, *Sewers, Threshold limit value, United Kingdom, *Safety factors, Working conditions.

It is necessary to relate the threshold limit value of materials in a sewer atmosphere to the concentration of volatile material in sewage. A scientific basis for predicting maximum allowable concentrations in sewage which makes use of vapor-pressure data and limiting activity coefficients is presented. Vapor pressures and limiting activity coefficients were determined in pure water for a range of volatile compounds of interest to water authorities. The limiting activity coefficients were determined for some of these compounds in crude and settled sewage. A transpiration method was used to measure the ratio between the vapor pressures of the pure substance and of a low molar concentration of the substance in solution, and the limiting activity coefficient was calculated. Values determined are presented for various organic substances, including toluene, chloroform, benzene, etc. The concept of relative atmospheric toxicity is discussed. (Small-FRC)

SELECTIVE PREDATION BY MYSIDS INLAKE RESTORATION BY BIOMANIPULATION,
Washington Univ., Seattle. Dept. of Zoology.
W. T. Edmondson, and P. Murtaugh.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-170359, Price codes: A03 in paper copy, A01 in microfiche. Project Completion Report, September 30, 1980. 28 p, 8 Fig, 4 Tab, 29 Ref. OWRT-A-096-WASH(1), 14-34-0001-9051.

Descriptors: *Lake restoration, *Ecosystems, *Predation, *Lake Washington(WA), *Daphnia, Electivity, Gut contents, Mysid, *Neomysis, Predation, Size selection, Zooplankton, Biomanipulation, Bioassy.

After decades of scarcity or absence, members of the crustacean genus Daphnia have become very abundant in Lake Washington in recent years. One hypothesis to explain the recent success of Daphnia is a decline in the abundance of the predatory crustacean Neomysis mercedis, apparently caused by changes in fish predation. This study focuses on the selection of prey by Neomysis and its relevance to the Lake Washington zooplankton community. In feeding experiments in small containers, clearance rates of Neomysis on Daphnia were roughly two to four times higher than those on the copepond Diaptomus. The 'preference' for Daphnia deduced by comparing gut contents to prey densities in the plankton is much more pronounced, and the cladocerans is consistently selected over all other prey species found in the lake. Small mysids select the smallest Daphnia available, but adult mysids can consume cladocerans as large as 3.0 mm. The pattern of electivity over the manageable size range of prey is variable for large Neomysis, suggesting that mysids may alter their feeding behavior in response to changing availability of prey. Since mysids reproduce seasonally in Lake Washington, their size-frequency distribution is alternately dominated by large and small individuals. Size-related differences in feeding rate and prey selection by the mysids therefore imply that the intensity and character of predation on Daphnia will very seasonally as well.

APPLICATION OF AN EVAPORATIVE LOSS MODEL TO ESTIMATE THE PERSISTENCE OF CONTAMINANTS IN LENTIC ENVIRONMENTS,
Purdue Univ., Lafayette, IN. Dept. of Forestry and Natural Resources.
A. Spacie, J. L. Hamelink, and R. C. Waybrant.
In: Special Technical Publication 634, American Society for Testing Materials, Philadelphia, PA. p 214-227, 1977, 4 Fig, 3 Tab, 19 Ref. OWRT-A-017-IND(5).

Descriptors: *Water analysis, *Toxicology, *Evaporative loss model, Persistence, *Aquatic environment, Ecosystems, Nonionic chemicals, *Lentic environment, Pollutants, Synthetic chemicals, Thermal stratification.

A simple, two-layer model for predicting evaporative losses of nonionic synthetic chemicals from water is presented. Losses from well-stirred small vessels are predicted accurately. Losses from thermally stratified bodies of water were poorly predicted because turbulent mixing processes at the interfaces were retarded.

DETAILED SURFACE WATER QUALITY DATA, SASKATCHEWAN, 1974-1976.
Saskatchewan Dept. of the Environment, Regina. Inland Waters Directorate.
Cat. No EN 36-430/6, ISBN 0-662-50706-1, Minister of Supply and Services Canada. 1980. 339 p, 1 Fig, 330 Tab.

Descriptors: *Surface waters, *Water quality, *Canada, *Baseline studies, *Water analysis, Water properties, Data collections, Rivers, Drainage systems, Drainage water, Freshwater, Running waters, Water resources, Biochemical oxygen demand, Nutrients, Cations, Anions, Trace elements, Organic wastes, Industrial wastes, Water pollution, Solid wastes, Pollutants, Turbidity, Water chemistry, Monitoring, Information exchange, Documentation, Phenols, Hydrogen ion concentrations, *Saskatchewan.

Chemical, physical, and biological surface water data for Saskatchewan, collected during the period 1974 to 1976, are reported. These data are intended to provide a ready reference to the water quality variables that were measured. The data were obtained from a number of Water Quality Branch programs. Included in the measured parameters were: water temperature, specific conductivity, pH, turbidity, apparent color, dissolved oxygen, total/fecal coliforms, chlorophyll a, BOD, total hardness, total dissolved solids, total alkalinity, inorganics (biocarbonate, sulfate, Ca, Mg, Na, K, Cl, F, P, B, Al, V, Cr, Mn, Fe, Cu, Zn, Se, Ag, As, Cd, Ba, Hg, Pb), cyanide, total nitrogen, nitrogen oxides, reactive silica, total organic/inorganic carbon, nitrilotriacetic acid, phenolics, n-alkanes, aromatic hydrocarbons, oil/grease, surfactants and pesticides (up to over 20, including PCB's). Analytical methods used for measurement of parameters are given in six-digit codes with the data. This baseline information supports work for assessing trends in the aquatic environment and impacts of development. This report is the first in a series of detailed water quality data reports to be published on a biennial basis. Earlier data for Saskatchewan were summarized in, 'Water Quality Data, Saskatchewan, 1961-1973'. (Zielinski-IPA)

PESTICIDES IN THE RIVERS OF THE KRUGER NATIONAL PARK (PLAAGDODERS IN RIVIERWATER VAN DIE NASIONALE KRUGERWILDTUIN),
Plant Protection Research Inst., Pretoria (South Africa).
L. P. Van Dyk.
Koedoe (Pretoria), No 21, p 77-80, 1978. 1 Tab, 3 Ref.

Descriptors: *Pesticide residues, *Sampling, *Water analysis, *Pesticides, *Pesticide detection, Kruger National Park, *South Africa, Rivers, River pollution, Pollution effects, Endosulfan, Dieldrin, DDT, Chlorinated hydrocarbons.

Rivers flowing into the Kruger National Park were monitored for pesticide residues. Altogether, 657 samples were taken from sites located on the Levubu, Letaba, Olifants, Sabie and Crocodile Rivers, These samples were analyzed over a period of two years and in only 11, or two percent, were pesticide residues found. Endosulfan was found in seven samples at concentrations ranging from 100 to 6300 nanogram per cubic decimeter. Dieldrin was found in two samples at concentrations of 1700 and 2000 nanogram per cubic decimeter, while DDT was found in the other two samples at concentrations of 100 and 500 nanogram per cubic decimeter. In 85 samples, or 13%, unkown chlorinated compounds were found, possibly industrial pollutants. The results of this survey indicated that pesticides in rivers do not pose a serious threat to wildlife in the Kruger National Park. (Stiles-IPA)

WASTE WATER SPRAY TRANSPORT IN LAND APPLICATION,
North Carolina Univ. at Chapel Hill. Dept. of Environmental Sciences and Engineering.
P. C. Reist, N. J. Zimmerman, A. G. Turner, D. E. Francisco, and P. Robinson.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-170540, Price codes: A10 in paper copy, A01 in microfiche. Water Resources Research Institute, University of North Carolina, Raleigh, Report No 152, Dec., 1980. 208 p, 23 Fig, 24 Tab. OWRT-B-104-NC(2), 14-34-0001-7176.

Descriptors: *Land application, *Waste water irrigation, Spraying, Aerosols, Tracking techniques, Tagging, Fluorescent dye, Public health, Bacteria, *Spray irrigation, *Pollutant identification, Path of pollutants, E. coli.

The objective of this study of waste water spray transport from land treatment was to generate a model to predict aerosolized viable particle dispersion from a spray system, taking into account the effects of particle size, microorganism viability and meteorological parameters such as solar radiation, relative humidity, temperature, wind speed and wind direction. Two spray solutions, one containing a viable atmospheric tracer, the bacteria E. coli, and the other a non-decaying tracer, the fluorescent dye, uranine, were simultaneously sprayed in an open field to simulate the aerosolized portion of a full-scale irrigation spray. Ambient concentrations were determined by sampling at distances up to 311 meters downwind. Maximum downwind concentrations were estimated from the dye field data for 65 experimental runs. These data combined with monitored meteorological data were analyzed for development of an appropriate atmospheric dispersion model. Viability of the airborne E. coli was determined from comparisons of the bacteria to dye ratios in the spray and in the samplers. Evaluation of typical waste water disposal operations with the emprical model and assumptions about waste water characteristics and spray equipment aerosolization efficiency indicate low levels of pathogens on the order of one per cubic meter expected thirty meters downwind from sprayed unchlorinated secondary waste water effluent or settled raw waste water depending on specific waste water properites.

QUANTITATIVE STUDIES ON A HUMAN PATHOGEN (CANDIDA ALBICANS) AND TRADITIONAL BACTERIAL INDICATORS OF POLLUTION IN DOMESTIC WASTE WATERS AND RECEIVING WATERS,
Connecticut Univ., Storrs. Inst. of Water Resources.
J. D. Buck.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-170516, Price codes: A02 in paper copy, A01 in microfiche. Research Project Technical Completion Report, 1980. 10 p, 2 Fig, 1 Tab, 4 Ref. OWRT A-085-CONN(2), 14-34-0001-0107.

Descriptors: *Sewage treatment, Indicators, Chlorine, *Sewage bacteria, *Coliforms, Candida albicans, Survival, *Human pathology, *Bioindicators, Bacteria, Water supply, Pollutant identification.

Significant ($p = 0.01$) positive correlations were found between four indicators of sanitary water quality (Total coliforms, fecal coliforms, fecal streptococci, and Pseudomonas aeruginosa) and the human and animal associated pathogenic yeast Candida albicans in samples taken from five waste water treatment plants over a 12 month period. No correlations were found among these indicators in contiguous receiving waters and sediments due to the low number of organisms present. Survival studies using C. albicans were conducted both in the laboratory and in the field. Fieldwork was done using plexiglas chambers. One study showed that survival was shorter in seawater and longer in distilled water, river water, and filtered raw sewage. A second study considered the effects of chlorine on C. albicans. Higher chlorine concentrations, longer exposure times, and lower pH were found to be deleterious to the survival of C. albicans. The results of this study support the potential of C. albicans for possible application as an indicator of sanitary water quality.
W81-01762

ANALYSIS OF TRACE LEVELS OF VOLATILE ORGANIC CONTAMINANTS IN MUNICIPAL DRINKING WATER BY GLASS CAPILLARY GAS CHROMATOGRAPHY USING SIMULTANEOUS FLAME IONIZATION AND ELECTRON CAPTURE DETECTION,
New Orleans Univ., LA. Center for Bio-Organic Studies.
L. V. McCarthy, E. B. Overton, C. K. Raschke, and J. L. Laseter.
Analytical Letters, Vol 13, No A16, p 1417-1429, 1980. 2 Fig, 1 Tab, 21 Ref.

Descriptors: *Halogenated organic compounds, *Organic compounds, *Potable water, *Water analysis, Volatile organic compounds, Analytical techniques, Gas chromatography, *Pollutant identification.

A rapid (40 minute) method for determining trace volatile organic compounds in drinking water used glass capillary gas chromatography with simultaneous flame ionization and electron capture detection. Both halogenated compounds and hydrocarbons were detected simultaneously at less than a microgram per liter for a 5 ml water sample. Some compounds not detected by flame ionization were identified by electron capture detection and vice versa. Purified diethyl ether was used as a solvent in preparing standard solutions. Solution A, which contained 13 organic compounds common in chlorinated water, was used to illustrate the system's resolution capabilities. Solution B, which contained benzene, toluene, and trihalomethanes, was used for quantitative calibrations and reproducibility studies. The coefficient of variance for 6 compounds (benzene, toluene, and trihalomethanes) was 80% or better in 20 replicate analyses. (Cassar-FRC)

COMBINED MEMBRANE FILTRATION-ELECTROCHEMICAL MICROBIAL DETECTION METHOD,
National Aeronautics and Space Administration, Hampton, VA. Langley Research Center.
J. R. Wilkins, D. C. Grana, and S. S. Fox.
Applied and Environmental Microbiology, Vol 40, No 4, p 852-853, October, 1980. 3 Fig, 1 Ref.

Descriptors: *Microbiology, *Membranes, *Filtration, Water analysis, Microorganisms, E. coli, Analytical techniques, *Pollutant identification, Coliforms.

E. coli were concentrated by membrane filtration and counted by platinum electrode detection. Bacteria were determined in 100 ml samples of undiluted estuarine and fresh water as well as in water diluted ten-fold and 100-fold. E. coli results compared favorably with previously estimated data in which platinum electrodes were tested in a broth-test tube setup. S. aureus produced erratic results. This combined technique may be a rapid and effective method for estimating microbial loading of water samples. (Cassar-FRC)

AUTOMATIC WATER QUALITY ANALYZERS FOR WASTE WATER COLLECTION AND TREATMENT,
Public Works Research Inst., Ibaraki (Japan).
K. Murakami.
Journal of the Water Pollution Control Federation, Vol 52, No 5, p 938-942, May, 1980.

Descriptors: *Monitoring, *Water quality, *Instrumentation, *Toxins, Analytical techniques, Chromium, Cadmium, Copper, Waste water treatment, Cyanide, Selective ion electrodes, *Japan.

By June, 1981, Japanese waste water treatment plants are required to use automatic analyzers for continuous monitoring and recording of organic loadings from treatment plants. Reliable automatic analyzers are needed to monitor hazardous substances, and work on several analyzers still in the developmental stages is summarized. A total cyanide analyzer is being developed which measures cyanide with a cyanide-selective ion electrode after removal of sulfur ions. A total chromium analyzer is a batch type model which uses an automatic background correction mechanism comprising a system of pre-oxidation by aeration before the addition of potassium permanganate. A hexavalent chromium analyzer using the ultraviolet absorption measurement method is under development. The cadmium analyzer uses cadmium ion-

selective electrodes as detection units. The bathocuproine method for cuprous ion analysis is used by the copper analyzer. Analyzers for organic substances are also under development. (Small-FRC)

RECENT CONCEPTS AND DEVELOPMENT OF AN AUTOMATED BIOLOGICAL MONITORING SYSTEM,
Virginia Polytechnic Inst. and State Univ., Blacksburg.
D. Gruber, J. Cairns, Jr., K. L. Dickson, A. C. Hendricks, and W. R. Miller, III.
Journal of the Water Pollution Control Federation, Vol 52, No 3, p 465-471, March, 1980. 7 Fig, 18 Ref.

Descriptors: *Monitoring, *Fish, *Ventilation, Model studies, *Bioindicators, *Water quality, Sodium compounds, Chlorine, Ventilatory frequencies, Breathing rate.

The possibility of using fish breathing behavior coupled with chemical/physical monitoring to monitor water quality is discussed. An apparatus is described containing 24 monitor tanks of bluegill. The system was first tested with 5 mg/liter sodium hypochlorite solution; the second test exposed fish to Arbitrary Reference Mixture, a standard developed for the petroleum industry. Chlorinated tap water was also used as a test solution. The primary response of the ventilatory behavior of bluegill to a strong solution of sodium hypochlorite was a significant decrease in the strength of the signals. Coughing also increased. The ventilatory response of fish exposed to ARM was similar. There was an initial decrease in ventilatory frequencies upon exposure to chlorinated tap water. These preliminary results indicate that biological monitoring is a feasible concept. An adequate statistical package capable of detecting abnormal breathing rates is needed. (Small-FRC)

STUDIES ON THE TOXICITY OF PULP AND PAPER MILL EFFLUENTS-I. MUTAGENICITY OF THE SEDIMENT SAMPLES DERIVED FROM KRAFT PAPER MILLS,
Shizuoka Coll. of Pharmaceutical Sciences (Japan).
N. Kinae, T. Hashizume, T. Makita, I. Tomita, and I. Kimura.
Water Research, Vol 15, No 1, p 17-24, January, 1981. 7 Fig, 7 Tab, 19 Ref.

Descriptors: *Genetics, *Effluents, *Toxicity, *Pulp wastes, *Analytical techniques, Industrial wastes, Water pollution sources, Water analysis, Assay, *Pollutant identification, Evaluation, Mass spectrometry, Gas chromatography.

Sediments from three coastal sites were assayed for mutagenic substances in an attempt to determine effects of nearby pulp and paper mill effluents. Among 28 compounds identified and tested, fluoranthene, pyrene, 2,6-di-tert-butyl-4-methylphenol, dihydroactinidiolide and juvabione were newly identified compounds of the sediments from the paper mill. Extracts were fractionated by the application of high-speed liquid chromatography and subjected to rec and reversion assay with B. subtilis and S. typhimurium and applied to gas chromatography - mass spectrometry analysis. (Titus-FRC)

TOTAL MERCURY AND METHYL MERCURY LEVELS IN BRITISH ESTUARINE SEDIMENTS - II,
Cape Town Univ. (South Africa).
P. D. Bartlett, and P. J. Craig.
Water Research, Vol 15, No 1, p 37-47, January, 1981. 14 Fig, 4 Tab, 22 Ref.

Descriptors: *Mercury, *Estuaries, Statistical methods, Sediments, Sampling, Organic compounds, Chemical analysis, Bacteria, Correlation analysis, *Pollutant identification, Path of pollutants, United Kingdom.

Results of various studies of total mercury and methylmercury levels in British estuarine sediments are discussed. Methylmercury formed an average of 0.46% of the total mercury present. Both mercury and methylmercury are associated with the silt fraction and organic rich sediments. Redox potential was found to influence the ambient level of methyl mercury. Data suggest that high sulfide levels enhance dimethyl mercury production in an aerobic environment. Additional research is needed on the relationship of methylmercury levels in sediments to microbiological activity. (Titus-FRC)
W81-01856

EVALUATION OF THE FALSE-POSITIVE ENTEROVIRAL PLAQUE PHENOMENON OCCURRING IN SEWAGE SAMPLES,
Hadassah Medical School, Jerusalem (Israel).
S. Kedmi, and B. Fattal.
Water Research, Vol 15, No 1, p 73-74, January, 1981. 1 Tab, 10 Ref.

Descriptors: *Viruses, *Epidemiology, *Laboratory tests, Water pollution, *Pollutant identification, Microorganisms, Toxicity, Waste water treatment, Sewage, Bacteria, Methodology, Sampling, Groundwater.

Laboratory procedures for limiting false-positive evaluation of viral plaques are discussed. Three samples of sewage, sewage effluent and polluted groundwater were analyzed using the plaque method. Plaques were randomly chosen and further investigated for enteroviruses using a tissue culture system. A large dose of antibiotics was always added to the sewage concentrate before inoculation into the BGM cell cultures. Plaques which appeared irregular were examined under a microscope. Areas in the tissue culture being evaluated as possible viral plaques in whose vicinity an unidentified particle was seen microscopically were not included in the results. Questionable plaques which could be non-viral were also excluded. It was found that prevention of contamination, stringent examination of plaques, and the short evaluation time used decreased the incidence of false positive results. However, this method may cause underestimation of the true viral concentration. (Titus-FRC)

THE EFFECT OF SURFACTANTS ON THE MIXED CHELATE EXTRACTION-ATOMIC ABSORPTION SPECTROPHOTOMETRIC DETERMINATION OF COPPER, NICKEL, IRON, COBALT, CADMIUM, ZINC AND LEAD,
Australian Atomic Energy Commission Research Establishment, Lucas Heights.
P. Pakalns.
Water Research, Vol 15, No 1, p 7-11, January, 1981. 3 Tab, 2 Ref.

Descriptors: *Surfactants, *Metals, *Spectrophotometry, Analytical techniques, Chelation, Detergents, Mass spectrometry, Chemical analysis, Separation techniques, *Trace elements, Ions.

The possible interference of various surfactants with detection of trace metals in natural waters was investigated. Standard volumes of trace metals were added to surfactant solutions and analyzed by atomic absorption spectrophotometry. It was found that cationic detergent interfered badly with the determination of cobalt and to some extent with cadmium, but for the remainder of the metals investigated, cationic detergent at 10 milligrams per liter gave recoveries between 95 and 103%. Non-ionic detergent also interfered badly with the determination of cobalt. Sodium pyrophosphate and sodium tripolyphosphate interfered significantly with iron and cadmium determination. NTA gave low recoveries for nickel and lead. In polluted natural waters a mixed-chelate method of extraction produced 100% recoveries for all seven metals extracted, and the ammonium pyrolidinedithiocarbamate, or APDC method of extraction required additions of aluminum to release nickel, iron and cobalt from complexiang agents. (Titus-FRC)

5B. Sources Of Pollution

TRIHALOMETHANES: IMPACT OF BROMIDE ION CONCENTRATION ON YIELD, SPECIES DISTRIBUTION, RATE OF FORMATION AND INFLUENCE OF OTHER VARIABLES,
Tennessee Univ., Knoxville. Dept. of Civil Engineering.
R. A. Minear, and J. C. Bird.
In: Water Chlorination, Environmental Impact and Health Effects, Vol 3, p 151-160, 1980. 6 Fig, 2 Tab, 10 Ref. Ann Arbor Science, Ann Arbor, Michigan. OWRT-A-051-TENN(2), 14-34-0001-0145.

Descriptors: *Trihalomethanes, *Water treatment, *Bromides, Carcinogen, *Potable water, *Tennessee, Chloroform, Sampling, Water analysis, Raw water, Treated water, Water pollution, Seasonal.

The objective of this study was to examine the effect of bromide concentration on trihalomethane formation under a variety of conditions that would simulate the drinking water treatment process, by means of lab-scale experiments. Results indicate that bromide concentration directly affects the rate of formation of trihalomethanes, the ultimate concentration after reaction, and the product distribution among the four expected trihalomethanes. Additionally, it was found that the bromide concentration influences the effects of both temperature and chlorine dose on trihalomethane formation. Conclusions indicate the significance of bromide levels in water supplies that are chlorinated.

WATER-QUALITY ASSESSMENT OF THE CYPRESS CREEK WATERSHED, WARRICK COUNTY, INDIANA,
Geological Survey, Indianapolis, IN. Water Resources Div.
L. L. Bobo, and C. A. Peters.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-221989, Price codes: A04 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 80-35, May 1980. 67 p, 17 Fig, 12 Tab, 34 Ref.

Descriptors: *Water quality, *Assessments, *Watersheds(Basins), *Mine drainage, *Indiana, Surface waters, Measurement, Watershed management, Flood control, Erosion control, Sediment control, Coal mine wastes, Path of pollutants, Water pollution sources, Chemical analysis, Bacteria, Pesticides, Water analysis, Warrick County(IN), Cypress Creek(IN).

The U.S. Soil Conservation Service needs chemical, biological, microbiological, and hydrological data to prepare an environmental evaluation of the water quality in the Cypress Creek watershed, Warrick County, Ind., before plans can be devised to (1) improve water quality, (2) minimize flood-

ing, (3) reduce sedimentation, and (4) provide adequate outlets for drainage in the watershed. The U.S. Geological Survey obtained these data for the Soil Conservation Service in a water-quality survey of the watershed from March to August 1979. Past and present surface coal mining is the factor having the greatest impact on water quality in the watershed. The upper reaches of Cypress Creek receive acid-mine drainage from a coal-mine waste slurry during periods of intense rainfall. All the remaining tributaries, except Summer Pecka ditch, drain mined or reclaimed lands. The general water type of Cypress Creek and most of its tributaries is calcium and magnesium sulfate. In contrast, the water type at background site 21 on Summer Pecka ditch is calcium sulfate. Specific conductance ranged from 470 to 4,730 micromhos per centimeter at 25 degrees Celsius, and pH ranged from 1.2 to 8.8. Specific conductance, hardness, and concentrations of major ions and dissolved solids were highest in tributaries affected by mining. The pH was lowest in the same tributaries. Concentrations of iron, manganese, and sulfate in water samples and chlordane, DDT, and PCB's in streambed samples exceeded water-quality limits set by the U.S. Environmental Protection Agency. (USGS)

INVESTIGATION OF ACIDITY AND OTHER WATER-QUALITY CHARACTERISTICS OF UPPER OYSTER CREEK, OCEAN COUNTY, NEW JERSEY,
Geological Survey, Trenton, NJ. Water Resources Div.
T. V. Fusillo, J. C. Schornick, Jr., H. E. Koester, and D. A. Harriman.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-103889, Price codes: A03 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 80-10, July, 1980. 30 p, 10 Fig, 4 Tab, 21 Ref.

Descriptors: *Water quality, *Acidic water, *Hydrogen ion concentration, *Surface waters, *New Jersey, Groundwater, Swamps, Streamflow, Precipitation(Atmospheric), Chemical analysis, Data collections, Oyster Creek(NJ), Ocean County(NJ).

Water-quality data collected in the upper Oyster Creek drainage basin, Ocean County, N.J., indicate that the stream has excellent water quality except for a persistently low pH. The mean concentrations of the major inorganic ions were all less than 6.0 milligrams per liter. Mean concentrations of total nitrogen and total phosphorus were 0.15 mg/L and 0.01 mg/L, respectively. Dissolved oxygen averaged 8.7 mg/L and 81% saturation. Low pH levels are typical of streams draining cedar swamps. In Oyster Creek, the pH tended to decrease downstream due to chemical and biological processes. The pH levels in swamps were one-half unit or more lower than the pH levels in the adjacent stream. Sharp declines in stream pH were noted during runoff periods as the result of the mixing of poorly-buffered stream water with more highly acidic water from surrounding swamp areas. The quality of ground water within the study area was similar to the quality of streamflow, except for higher iron and ammonia-nitrogen concentrations and a higher pH range of 4.9 to 6.5. Precipitation represented a major source of many chemical constituents in the ground- and surface-waters of the Oyster Creek basin. (USGS)

QUALITY OF WATER AND TIME OF TRAVEL IN YOCKANOOKANY RIVER, CHOCTAW COUNTY, MISSISSIPPI,
Geological Survey, Jackson, MS. Water Resources Div.
G. A. Bednar.
Available from the OFSS, USGS Box 25425, Fed. Ctr. Denver CO 80225, Price: $4.75 in paper copy, $3.50 in microfiche. Geological Survey Open-File Report 80-770, 1980. 33 p, 5 Fig, 2 Tab, 9 Ref.

Descriptors: *Water quality, *Streamflow, Surface waters, *Mississippi, Hydrologic data, Dye releases, Tracking techniques, Water analysis, Bacteria, *Path of pollutants, Water pollution sources, Time of travel, *Choctaw County(MS), *Yockanookany River(MS).

An intensive water-quality study along a 3.3 mile reach of the Yockanookany River, Choctaw County, Miss., was conducted on August 29-31, 1978. Water-quality data were collected during a period of generally low streamflow and seasonally high air temperatures. The dissolved-solids concentrations were less than 50 milligrams per liter. In the water leaving the study reach, the ammonia nitrogen concentration ranged from 0.10 to 0.40 milligrams per liter and total phosphorus concentrations ranged from 0.14 to 0.43 milligrams per liter. The 5-day biochemical oxygen demand was generally less than 6.0 milligrams per liter and dissolved-oxygen concentrations ranged from 5.5 to 8.1 milligrams per liter. Fecal bacteria densities were high. Fecal streptococcal bacteria in the water leaving the study reach ranged from 460 to 13,000 colonies per 100 milliliters. The rate of solute travel was 0.15 miles per hour through the study reach. (USGS)

SOURCES OF TOXIC COMPOUNDS IN HOUSEHOLD WASTEWATER,
Municipal Environmental Research Lab., Cincinnati, OH. Wastewater Research Div.
S. W. Hathaway.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-110942, Price codes: A05 in paper copy, A01 in microfiche. Environmental Protection Agency Report EPA-600/2-80-128, August, 1980. 90 p, 5 Tab, 15 Ref, 1 Append.

Descriptors: *Domestic wastes, *Pollutants, *Waste water(Pollution), *Water pollution sources, Solvents, Heavy metals, Phenols, Pesticides, Paints, Water pollution, Chemicals, Toxins, Toxic substances, Waste water treatment.

Although it is assumed that the largest contribution of toxic pollutants is from industrial discharges, the identification and concentration of these pollutants from strictly domestic wastewater sources is largely unknown. The occurrence of toxic chemicals in the household wastewater is of great concern not only for municiple wastewater treatment plant discharges but more importantly for small community systems and single dwelling wastewater treatment systems which may have an impact on the ground water quality. This report presents the results of a literature search into the occurrence of the Environmental Protection Agency's selected 129 priority pollutants in household wastewater. Consumer product categories and general types of products containing the toxic compounds used in and around the home are identified. The most frequently used products containing toxic chemicals are household cleaning agents and cosmetics. Solvents and heavy metals are the main ingredients of these products, which are used on a daily basis. Deodorizers and disinfectants containing naphthalene, and phenol and chlorophenols, are also high on the frequency list. Pesticides, laundry products, paint products, polishes, and preservatives are wasted infrequently but are commonly wasted in large volumes. Thus the fate of low level frequent discharges and high level infrequent discharges of toxic chemicals must be addressed in further research work with individual wastewater treatment systems or small community systems. DISSOLVED OXYGEN MEASUREMENTS IN OHIO STREAMS FOLLOWING URBAN RUNOFF,
Ohio State Univ., Columbus. Water Resources Center.
R. C. Stiefel.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-222045, Price codes: A05 in paper copy, A01 in microfiche. Environmental Protection Agency Report EPA-600/2-80-092, July, 1980. 84 p, 13 Fig, 1 Tab. R805201-01.

Descriptors: *Urban runoff, *Dissolved oxygen, *Water quality, *Storm runoff, Flow rates, Cities, Ohio, Combined sewers, Water pollution, Streams, Precipitation, Evaluation.

Thirteen towns and cities in Ohio, situated on streams and rivers having different mean daily flow rates, were investigated during the summer and spring of 1977 to determine their suitability as sites for more extensive field studies on the impacts of urban runoff on dissolved oxygen (D. O.) levels in the streams. The towns included Akron, Bucyrus, Delphos, Findlay, Lancaster, Lima, Newark, Norwalk, Tiffin, Upper Sandusky, Wapakoneta, Washington Court House and Wooster. Among factors considered in the selection process were a demonstrable impact of the urban runoff on D. O. levels, accessibility to stream sampling locations, and the availability of stream and precipitation gages. Sites were rejected because (1) poor quality effluents from municipal and industrial treatment plants masked the impacts of combined sewer overflows (CSOs); (2) stream drainage pattern was too complex to monitor; or (3) impacts of the CSOs did not decrease the D. O. to less than 5 mg/l. Only the towns of Lancaster, Newark and Wapakoneta satisfactorily met the criteria established to qualify them as locations for more extensive field studies. MAXIMUM UTILIZATION OF WATER RESOURCES IN A PLANNED COMMUNITY; CONTRIBUTIONS OF REFRACTORY COMPOUNDS BY A DEVELOPING COMMUNITY,
Rice Univ., Houston, TX. Dept. of Biology.
F. M. Fisher.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-112880, Price codes: A05 in paper copy, A01 in microfiche. Environmental Protection Agency Report EPA-600/2-80-113, August, 1980. 81 p, 7 Fig, 4 Tab, 3 Ref, 2 Append. 802433.

Descriptors: *Chlorinated hydrocarbon pesticides, *Polychlorinated biphenyls, *Community development, *Water pollution, Water resources development, Pesticide residues, Road construction, Land forming, Golf courses, Soil contamination, Artificial lakes, Drainage system, Fish, Storm water, Return flow, Mirex, Chlordane, Water utilization, Environmental effects, Planned community.

This project was undertaken to examine the role of a developing community in contributing refractory organochlorine compounds to the aquatic ecosystem. Water, soil, and biotic components from a natural drainage system in The Woodlands, Texas, were assayed for halogenated compounds. In addition, components from two man-made lakes and the recipient stream were evaluated. Polychlorinated biphenyl (PCB) residues were detected during each year of the three-year study. The levels of PCBs were highest during the first year (about 350 ppb in soil and animal samples) and diminished to 1/10 of those values during the second and third years of study. The highest residue values were coincident with the period of development when cut and fill operations, roadbed construction, and service installation were being effected. Mirex was found in soil, water, and organisms from the drainage area around The Woodlands Golf Course, as were residues of chlordane. The pesticide levels in fish never exceeded 5.6 ppb for mirex and 6.1 ppb for chlordane. Both compounds were apparently transported into the Conference Center Lakes by stormwater or washed in by returning irrigation water from the golf course. Fish from Panther Branch, which receives stormwaters from overlfow of the Conference Center Lakes, contained less than one fourth the amount of mirex and chlordane found in golf course sam-

plings. The data indicated that biotic and abiotic components of the lakes serve as effective sumps for these pesticides. (Moore-SRC)

THE EFFECTS OF LIGHT ON THE DISSIPATION OF CHLORINE IN SEA-WATER,
Old Dominion Univ., Norfolk, VA. Inst. of Oceanography.
G. T. F. Wong.
Water Research, Vol 14, No 9, p 1263-1268, September, 1980. 4 Fig, 1 Tab, 17 Ref.

Descriptors: *Sea water, *Chlorination, Ambient light, Laboratory tests, Light intensity, *Light penetration, *Chlorine, Bromine, *Chemical reactions, Dissipation, Residual chlorine, *Chesapeake Bay.

A laboratory investigation of the effects of light on the dissipation of chlorine in sea water samples collected near the mouth of the Chesapeake Bay is reported. Bromate is one of the products formed when chlorinated sea water is exposed to light; the rate and amount of bromate formation increase with the intensity of the light. The increase of chlorine demand in the presence of light can be accounted for only partially by the formation of bromate. Other, unidentified reactions must also occur. Even in the absence of light some unidentified species are formed. Thus, the effects of light on the rate and mechanism of the dissipation of residual chlorine can be significant even at low light intensities. Future studies should consider the fate of chlorine in the light and in the dark. The many possible products formed during the chlorination of sea water must be determined, and their toxicity assessed. (Small-FRC)

MATHEMATICAL MODEL FOR WATER QUALITY IN STREAMS IMPACTED BY POINT AND NONPOINT SOURCE POLLUTION,
Kentucky Water Resources Research Inst., Lexington.
M. E. Meadows.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-170367, Price codes: A04 in paper copy, A01 in microfiche. Research Report No 126, 1981. 60 p, 8 Fig, 3 Tab, 23 Ref. OWRT-A-078-KY(1), 14-34-0001-9019, 14-34-0001-0119.

Descriptors: *Storm runoff, Small watersheds, Storm water, *Water pollution, *Streamflow, *Model studies, Water quality, Streams, Mathematical models, *Path of pollutants, Pollutant transport, Storm water quality, Nonpoint source pollution, Water quality modeling, Unsteady streamflow, Kinematic streamflow.

Modeling the impacts of stormwater runoff on small streams requires that the prediction model has the capability of simulating the behavior of the hydrologic and water quality components of the stream system. Development of such a model involves coupling the equations for pollutant transport during flow with the appropriate flood routing equations. The decision on which equations to choose requires a full understanding of the pollutant transport and hydrograph dispersion processes. This research was undertaken to develop a rigorous theoretical evaluation of the pollutant transport and hydrograph dispersion process during unsteady flow, and to recommend a suitable model for simulating the impact of stormwater on small streams. It was determined that the one dimensional convective - dispersive equation for tracers (pollutants) coupled with a form of the diffusive wave model for unsteady streamflow would provide the basis for a simulation model that is both simple and consistent with the principal transport process. Evaluation of the dynamic terms in the momentum equation yielded general estimators to model parameters and established that the Muskingum routing model is consistent with the modified diffusive wave model developed during this research. The coefficient for hydrograph dispersion was tested on tracer dispersion data and was found to be a reasonable prediction equation for channels with top widths less than 115 feet and bed slopes greater than 1.6 feet per mile. Most small streams satisfy these conditions.

NON-POINT SOURCE POLLUTION IN FOREST STREAMS OF THE WESTERN OLYMPIC MOUNTAINS,
Washington Univ., Seattle. Coll. of Forest Resources.
D. D. Wooldridge, and A. G. Larson.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-170342, Price codes: A06 in paper copy, A01 in microfiche. Project Completion Report, September 5, 1980. 103 p, 27 Fig, 9 Tab. OWRT-B-076-WASH(1), 14-34-0001-8127.

Descriptors: *Water pollution sources, *Forest watersheds, *Washington, *Non-point pollution, Road construction, Clear-cutting, Overland flow, Streams, Inflow, Dissolved solids, Nutrient cycling, Suspended sediment, Forest ecosystems, Forest management.

Several watershed studies of forest ecosystems have identified inputs of certain elements in precipitation and outputs from the ecosystem in streamflow. Effects of silvicultural activities on the elemental composition, sediment, and temperature of streamflow also have been reported. This study of experimental watersheds in the western Olympics subdivided the forest ecosystem into zones and identified the concentrations and elemental migration of certain elements between zones. Initial study identified processes of the undisturbed forest. Alteration of these processes by road construction and clearcut forest harvest also was studied. The mode of study evaluated the effects of silvicultural activities on non-point sources pollution with use of Best Management Practices for road construction, felling and bucking of timber, and yarding. Concepts and principles of environmental geochemistry were incorporated in the analyses of cause and effect relationships between ecosystem processes, non-point sources of pollution, and water quality. Elemental migration through zones of the ecosystems is related to abundance and characteristics of the element as well as biological processes. Dissolved constituents found in streamflow of the western Olympics have their primary source in geochemical weathering of parent materials and bedrock. HCO sub 3, Ca, SiO sub 2-Si, and Cl were dominant constituents of streamflow (65, 19, 6, 4%, respectively). Based on initial comparisons of dissolved constituents in streams for pre- and postlogging in this study, and results of other studies, it is concluded that the dissolved water quality of streams from managed forest watersheds will exceed both the drinking water quality standards and the median quality currently used by the 100 largest U.S. cities.

SEASONAL VARIATIONS IN TRIHALOMETHANE LEVELS IN AN IOWA RIVER WATER SUPPLY,
Oklahoma State Univ., Stillwater.
J. N. Veenstra, and J. L. Schnoor.
Journal of the American Water Works Association, Vol 72, No 10, p 583-590, October, 1980. 13 Fig, 4 Tab, 23 Ref. OWRT-A-072-IA(1).

Descriptors: *Iowa River, Fluctuations, Water treatment, *Organic compounds, Iowa, Wells, Rivers, Seasonal, Oxidation, Temperature, Hydrogen ion concentration, Physical properties, Chlorination, Gas chromatography, Bromides, Water pollution sources, Solar radiation, *Humic acids, *Fulvic acids, Potable water, *Trihalomethane.

Water samples taken at two sites along the Iowa River, one upstream and one downstream from the Coralville Reservoir were analyzed for seasonal variations in trihalomethane (THM) levels. Total THM (TTHM) levels at the Coralville well and the effects of chlorination and solar radiation upon THM production in Iowa River water were also examined. Results of gas chromatographic studies on water samples indicated that humic and fulvic acids were the predominant peaks showing seasonal variations. TTHM levels varied seasonally from 50 to 335 micrograms/liter in samples concentrated about 1.4 times. Brominated THM levels were highest in late fall and winter coinciding with patterns of bromide ion concentrations. It was concluded that seasonal variations in the nature of the precursors was the main determinant of final TTHM levels in Iowa River water. Temperature and pH had little effect on THM seasonal variations. Water samples from the Coralville well contained haloforms which were composed of about 88% brominated compounds as compared to surface water which was made up of 27% brominated compounds in its haloform composition. When the point of chlorination was moved back in the treatment of the Iowa River water, TTHMs were produced. Solar radiation reduced THM production by reducing chlorine content of the water rather than by reducing the level of THM precursors. (Geiger-FRC)

ADSORPTION MASS TRANSFER MODEL FOR VIRUS TRANSPORT IN SOILS,
California Univ., Los Angeles. Dept. of Chemical, Nuclear, and Thermal Engineering.
V. L. Vilker, and W. D. Burge.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-127210, Price codes: A04 in paper copy, A01 in microfiche. Water Research, Vol 14, No 7, p 783-790, July, 1980. 6 Fig, 3 Tab, 13 Ref. (California Water Resources Center Project UCAl-WRC-W-523). OWRT-B-184-CAl(7).

Descriptors: *Viruses, *Mathematical models, Bacteriophage, Soil testing, Soil properties, Isotherm, Adsorption, Aquatic microbiology, Activated carbon, Columns, Migration, *Path of pollutants, Mass transfer, Soils.

An adsorption mass transfer model was applied to describe virus association with soils and soil components. The analysis indicates that virus adsorption to activated carbon, soils, and soil components is saturation limited. Although the number of adsorption sites, Q, is large, the association of virus particles with them is characterized as weak due to the small value of the isotherm equilibrium parameter K sub L. An adsorption mass transfer model adequately describes the rate of adsorption in batch systems and percolating soil beds. The method was illustrated by calculation of the bacteriophage theta xi-174 profiles in a column of silt loam soil. Animal virus profiles in specific soils can be calculated by the same method when the isotherm parameters K sub L and Q and the mass transfer coefficient K sub f are known. Verification of this model by experimental studies with virus-soil adsorbent systems for which these parameters are known is needed, especially for the animal viruses. Future models will require that the timescale of transport through soil beds of practical depths found in the field incorporate the effect of natural inactivation in order to assess virus breakthrough. A SUBSURFACE WATER QUALITY MODEL FOR WESTERN SURFACE MINE SITES,
North Dakota Water Resources Research Inst., Fargo.
R. D. Koob, D. E. Tallman, G. Groenewald, B. Rehm, and J. Cherry.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-170557, Price codes: A02 in paper copy, A01 in microfiche. Completion Report, Feb., 1981. 4 p. From Symposium on Surface Mining Hydrology, Univ. of Kentucky, Lexington, Dec 1-5, 1980, p 465-473. OWRT-B-053-NDAK(1), 14-34-0001-9089.

Descriptors: Geochemistry, *Hydrogeology, Surface runoff, *Mining, Industrial wastes, *Subsurface waters, *Water pollution sources, Model studies, Water quality, Soil analysis, Soil chemistry, Clay minerals, Soil chemical properties, Mineralogy, Mining engineering, Strip mines, Water analysis, Groundwater, Analysis, Anions, Cations, Ions, Planning, Forecasting, Projections, Estimating, North Dakota, Wyoming, Montana, Canada, *Baseline studies, Strip mines.

Regional similarities in chemical characteristics of shallow groundwater were indicated from hydrochemical data from proposed surface mining sites in North Dakota, Montana, Wyoming, and Alberta. Groundwater similarity characteristics were noted for dominant anions (sulfate and bicarbonate) and cations (sodium and calcium), pH (7-9), and electrical conductance of shallow groundwater (500-4500). A hydrogeochemical model was developed for this region, based on mineralogical data and unsaturated/saturated zone hydrochemical characteristics. Critical hydrogeochemical processes were considered. Mineralogical variability results in significant groundwater quality differences within/between proposed mining sites. The model suggests a severe potential for groundwater degradation in certain Northern Great Plains (NGP) mine settings, especially where unoxidized pyritic and sodium montmorillonitric overburden exist in the near-surface weathering zone (sulfate and sodium in NGP spoils range up to 10 grams/liter and 3.5 grams/liter, respectively, in sodic-pyritic overburden areas). Groundwater degradation can be minimized if key mineralogical variables (as a function of the original sediment depositional settings) are understood and integrated within the mine design framework. BACTERIAL AEROSOLS PRODUCED FROM A COOLING TOWER USING WASTE WATER EFFLUENT AS MAKEUP WATER,
Army Proving Ground, Dugway, UT.
A. P. Adams, M. Garbett, H. B. Rees, and B. G. Lewis.
Journal of the Water Pollution Control Federation, Vol 52, No 3, p 498-501, March, 1980. 3 Tab, 6 Ref.

Descriptors: *Cooling water, *Bacteria, *Reclaimed water, Effluents, Chlorine, Cooling towers, Coagulation, Aerosols, Air pollution, Nutrients.

The potential aerosol hazard produced by the use of waste water effluent as make-up water for cooling towers was investigated, and methods for controlling the bacteria were studied. Bacteria found in the cooling water basin at an 85 MW plant in the southwestern US were determined, and bacteria bearing particles exiting the cooling towers were measured. Chlorine was effective in reducing the number of bacteria, while coagulation was even more effective. However, after all treatments, the total number of bacteria in the tower, except for enteric bacteria, increased rapidly. While coagulation treatment reduced the amount of phosphate and bacteria in the effluent of the plant, it had little effect on removing dissolved nutrients, as was demonstrated by the regrowth of Pseudomonas. An electric utility using chlorine dioxide as a tower disinfectant emitted fewer bacteria-bearing particles. However, an electric utility using polluted river water as cooling water emitted the most bacteria. (Small-FRC)

POLIOVIRUS RETENTION IN 75-CM SOIL CORES AFTER SEWAGE AND RAINWATER APPLICATION,
Brookhaven National Lab. Upton, NY. Dept. of Energy and Environment.
E. F. Landry, J. M. Vaughn, and W. F. Penello.
Applied and Environmental Microbiology, Vol 40, No 6, p 1032-1038, December, 1980. 2 Fig, 3 Tab, 20 Ref.

Descriptors: *Viruses, *Water pollution sources, *Polio viruses, *Soil contamination, Public health, Path of pollutants, Cores, Sewage effluent, Rain water, Recharge, Groundwater recharge, Infiltration rates, Soil water movement, Long Island, Adsorption, Microorganisms.

Guanidine-resistant poliovirus LSc was chosen as a test strain to measure adsorption by Long Island soils in an experimental recharge basin. Polyvinyl chloride pipes were driven into the basin surface. The soil within the pipes was infiltrated at the rate of 1 cm per hour with seeded sewage effluent and allowed to drain. Analysis of the viruses in the 75 cm soil core showed that 77% of the viruses were adsorbed in the first 5 cm, 11% in the second 5 cm segment, 8% in the 10 to 30 cm section, and 4% uniformly distributed throughout the remainder of the 75 cm length. Less than 0.22% was detected in the core filtrates. Rinsing with either sewage effluent or rain water eluted only an additional 0.16%, showing that there was little virus movement from the core. Migration within the core was studied by rinsing virus-treated soil with rainwater and sewage effluent. In the top 5 cm segment, these did not differ from the control. In the 5 to 10 cm section, the control contained 9.29% of the viruses; rain water-rinsed, 18.25%; and sewage-rinsed, 4.36%. No significant differences were seen in the 10 to 15 cm section. In the rain water core, viruses apparently migrated from the middle section into the deeper part. Sewage-rinsed soil contained more viruses at the 25 to 50 cm depth than the control, but less than rain water. Although this data is typical for a number of enterovirus types, it may not apply to other soils, higher infiltration rates, and viruses which adsorb poorly in soils. (Cassar-FRC)

EFFECTS OF ENVIRONMENTAL VARIABLES AND SOIL CHARACTERISTICS ON VIRUS SURVIVAL IN SOIL,
Baylor Coll. of Medicine, Houston, TX. Dept. of Virology and Epidemiology.
C. J. Hurst, C. P. Gerba, and I. Cech.
Applied and Environmental Microbiology, Vol 40, No 6, p 1067-1079, December, 1980. 10 Fig, 2 Tab, 18 Ref.

Descriptors: *Soil properties, *Viruses, *Waste water disposal, *Regression analysis, *Water pollution sources, Variability, Microorganisms, Soil moisture, Hydrogen ion concentration, Adsorption, Phosphorus compounds, Aluminum, Organic matter, Temperature, Disposal, Conductivity, Cation exchange, Ultimate disposal, Sewage effluent.

The effects of soil and environmental variables on the persistence of waste water viruses in soil were studied using test samples of soil wetted with suspensions of virus in distilled water, secondary sewage effluent, or mixtures of effluent and water. Virus strains used were coxsackieviruses A9 and B3, echovirus 1, poliovirus 1, rotavirus SA11, and bacteriophages T2 and MS2. Temperature had a large effect on survival of the viruses, inactivation rates increasing with temperature. Virus survival under aerobic nonsterile conditions was less than that occurring in other conditions tested--aerobic sterile, anaerobic sterile, and anaerobic nonsterile. As soil moisture increased, virus survival decreased to a minimum at 15%, then increased with added soil liquid. Considering 10 soil characteristics, the most influential (virus adsorption to soil, extractable phosphorus, exchangeable aluminum, and pH) accounted for 51% of all the variance in the experiment. Statistically insignificant factors were % silt, % organic matter, conductivity, surface area, exchangeable calcium, and total cation exchange capacity. (Cassar-FRC)

EFFECTS OF ADAPTATION ON BIODEGRADATION RATES IN SEDIMENT/WATER CORES FROM ESTUARINE AND FRESHWATER ENVIRONMENTS,
Environmental Research Lab., Gulf Breeze, FL.
J. C. Spain, P. H. Pritchard, and A. W. Bourquin.
Applied and Environmental Microbiology, Vol 40, No 4, p 726-734, October, 1980. 8 Fig, 2 Tab, 12 Ref.

Descriptors: *Microorganisms, *Biodegradation, Methyl parathion, p-Nitrophenol, Aquatic bacteria, Bacteria, *Sediments, Cores, Estuaries, Pesticides, Adaptation, Freshwater.

Adaptation among natural microbial populations exposed to methyl parathion (MP) and p-nitrophenol (PNP) was investigated. Specific attention was directed to the issue of whether adaptation could affect predictions of biodegradation rates for xenobiotics at low concentrations in the environment. A preliminary experiment was conducted to determine whether adaptation could be detected in mixed cultures by following mineralization. For this study, a number of ecocores were taken from the Escambia River sampling site, spiked with MP or PNP and analyzed. Both MP and PNP were mineralized much more rapidly in cores preexposed to the compounds at a concentration of 180 micromolar PNP. Cores that received lower concentrations of the parent compounds, 0.45 micromolar released carbon dioxide at a much lower overall rate. Differences in initial biomass concentrations at the sample sites did not account for differences in adaptation patterns. The addition of yeast extract to flasks containing samples from a specific site did not facilitate adaptation, indicating that nutrient limitations was not the deciding factor. Organisms able to degrade MP in pure culture were not isolated from either sampling site. The fact that preexposure to PNP increases the fraction of the population able to degrade PNP supports the idea that a particular segment of the population is selected by exposure to the nitrophenol. The ability of the microbial population to adapt and rapidly degrade a compound may be an additional rate-determining factor. (Baker-FRC)

T. Januszkiewicz, and K. R. Januszkiewicz.
Acta Hydrobiologica, Vol 22, No 2, p 157-178, 1980. 6 Fig, 2 Tab, 34 Ref.

Descriptors: *Lake sediments, *Bottom sediments, *Lake Zagnanie(Poland), *Chemical analysis, Water pollution sources, Limnology, Eutrophication, Poland, Water pollution effects, Sewage, Organic matter, Calcium carbonate, Metals, Phosphates, Phosphorus compounds, Nitrogen compounds, Manganese, Farm wastes.

The upper layer (15 to 20 cm thick) of sediments at the bottom of Lake Zagnanie, Poland, was analyzed chemically as part of a study to determine whether pollutants from farms and sewage disposal were responsible for recent decreases in fish harvests. Among the many analyses performed were pH, water content, organic matter content, insolubles, ammonia nitrogen, total nitrogen, phosphates, total phosphorus, sulfates, total sulfur, silica, and several metal oxides. The major sediment components were calcium carbonate, silica, and organic matter. Anthropogenic sources were believed responsible for the higher levels of organic matter, sulfides, iron and manganese found near the mouth of an inlet river. Iron and aluminum act as floccu-

lants for Mn-phosphorus complexes that were found. (Cassar-FRC)

RURAL NONPOINT SOURCE WATER QUALITY IN A SOUTHEASTERN WATERSHED,
North Carolina State Univ. at Raleigh. Dept. of Biological and Agricultural Engineering.
F. J. Humenik, L. F. Bliven, M. R. Overcash, and F. Koehler.
Journal of the Water Pollution Control Federation, Vol 52, No 1, p 29-43, January, 1980. 6 Fig, 8 Tab, 13 Ref.

Descriptors: Streams, Watersheds(Basins), *Land use, *Water quality, *Rural areas, *Runoff, Nutrients, Soil chemistry, Seasonal, Channeling, *North Carolina.

An interpretation of rural stream water quality in the Chowan River basin is presented which is based on a two-year grab sampling program. Data analyses are summarized by sections which present overall basin data, comparisons between physiographic areas, relationships between water quality and land use, comparisons of channelized and nonchannelized stream water quality, analyses of seasonal fluctuations, and concentration versus water yield analysis. The four areas of the basin sampled had relatively constant mean nutrient concentrations. The greatest variation was seen between the piedmont and the coastal plain areas. This was thought to be due to natural variations in soil type, etc. There was no clear relationship between water quality and land use, but these results may be due to the limited number of sampling sites. Seasonal trend analysis indicated that nutrient loads were greater during the winter and spring, reflecting rainfall cycles. The effect of channelizing was pronounced with respect to the high NO3-N concentrations found in channelized streams. Nutrient concentrations showed no consistent relationship with flow. (Small-FRC)

CYANIDE PROBLEMS IN MUNICIPAL WASTE WATER TREATMENT PLANTS,
Metropolitan Sanitary District of Greater Chicago, IL. Development Div.
D. T. Lordi, C. Lue-Hing, S. W. Whitebloom, N. Kelada, and S. Dennison.
Journal of the Water Pollution Control Federation, Vol 52, No 3, p 597-609, March, 1980. 6 Fig, 8 Tab, 14 Ref.

Descriptors: *Toxins, *Municipal wastes, *Water quality standards, Illinois, Industrial wastes, Treatment facilities, Performance, Effluents, Toxicity, Minnows, *Cyanide.

The occurrence of cyanide, the distribution of cyanide species in waste water, and the control of cyanide are discussed. Cyanide levels in the Metropolitan Sanitary District of Greater Chicago (MSDGC) treatment plant effluents have been monitored daily since 1972. All of the plants had daily cyanide concentrations that at times exceeded 0.025 mg/liter, the Illinois Pollution Control Board's original effluent limit. The Calumet plant, which receives water from a highly industrialized area including five steel plants, had the highest cyanide levels, with an annual average of 0.095 mg/liter. The major portion of the cyanide was found to be in complex form (iron or cobalt cyanide complexes). The average cyanide removal rates by the industrialized plants were 0-91%. A series of 96-hour acute toxicity tests was performed using unchlorinated, nitrified and non-nitrified effluent from the plants on fatheaded minnows. There was no evidence of toxicity, probably because cyanide occurred in complexes of reduced toxicity. The new Illinois cyanide standard is 0.10 mg/liter of total cyanide as a monthly average and 0.20 mg/liter for any 24-hour period. (Small-FRC)

Journal of the Water Pollution Control Federation, Vol 52, No 1, p 192-201, January, 1980. 8 Fig, 4 Tab, 8 Ref.

Descriptors: *Dissolved oxygen, *Sediments, *Overflow, *Combined sewer overflows, Rivers, Water pollution sources, Scour, Temperature, Velocity, Wisconsin, *Milwaukee(WI), Milwaukee River.

The effect of combined sewer overflow on the Milwaukee river was investigated for the following three purposes; to demonstrate that sediments are the source of the large wet weather oxygen demand, to show that scouring by submerged combined sewer overflow outfalls is the mechanism by which this demand is exerted, and to develop a method of predicting the impact of sediment scouring on dissolved oxygen levels. This information can help in the development of realistic receiving water models. Field investigations monitored dissolved oxygen, temperature, disturbed and undisturbed sediments, and water velocity. Data were analyzed using multiple linear regression. Sediment oxygen demand rates indicated that the river is a significant sink for dissolved oxygen even in dry weather. Velocity measurements in the vicinity of combined sewer outfalls indicated that the scouring of sediments by discharges is the probable mechanism by which the sediments cause rapid drops in dissolved oxygen levels. Combined sewer overflow abatement is recommended. (Small-FRC)

RETENTION OF RADIONUCLIDES BY MOBILE HUMIC COMPOUNDS AND SOIL PARTICLES,
Washington State Univ., Pullman. Dept. of Chemical Engineering.
J. C. Sheppard, M. J. Campbell, T. Cheng, and J. A. Kittrick.
Environmental Science & Technology, Vol 14, No 11, p 1349-1353, November, 1980. 3 Fig, 3 Tab, 12 Ref.

Descriptors: *Adsorption, *Radioactive wastes, *Colloids, Humic acid, Fulvic acid, Nuclear wastes, *Path of pollutants, Soil types, Model studies, Soil water, Percolation, Particle size, Clays, Kaolinite, Cations, Separation techniques, Mathematical studies.

The transport of radionuclides in soils and groundwater may be facilitated by particles of colloidal dimensions. Five US soils (two silt loams, one sand, one loamy sand and a sandy clay loam) were analyzed for particulate and ionic distribution ratios in relation to the effects of the ionic species, humic and fulvic acid complexes of radionuclides and radionuclide-bearing soil colloids (clays). The distributions of radionuclides between the soil and aqueous phases were determined by characteristic spectra of radionuclide-bearing particles. Three broad classes of particles determined the distribution ratios of the soils studied: ionic (particles with radionuclides having radii less than 1 mm); complexes of humic matter, possibly humic acid polymers (2-3 mm radii); and larger soil particles bearing radionuclides with radii of 10-60 mm. Gel filtration studies revealed that humate complexes dominated the distribution ratios for the soil systems tested. Evidence is presented to show that much of the mobility of radionuclides in the soil-aquatic environment is due to soil particles in the 2-3 mm range. Sorption sites for radionuclides appear to be on the surface of the soil particles, with adsorption tendencies of the U, Cs, Sr, and Am cations varying with the charge density of the hydrated ions. Humic complexing of radionuclides tends to alter the migration equation commonly used for soil-aquatic systems and greatly complicates the modeling of radionuclide transport. (Geiger-FRC)

PRODUCTION OF UREA BY BACTERIAL DECOMPOSITION OF ORGANIC MATTER INCLUDING PHYTOPLANKTON,
Yamagata Univ. (Japan). Dept. of Chemistry.
Y. Satoh.
Internationale Revue Der Gesamten Hydrobiologie, Vol 65, No 2, p 295-301, 1980. 2 Fig, 2 Tab, 13 Ref.

Descriptors: *Urea, *Decomposing organic matter, *Bacteria, Water pollution sources, Eutrophication, Organic matter, Lakes, Nitrogen compounds, *Phytoplankton, Fragilaria crotonensis, Aquatic microorganisms, Japan, *Lake Suwa(Japan).

Urea was produced by aerobic bacterial decomposition of Fragilaria crotonensis, a dominant member of the phytoplankton community in water of Lake Suwa, Japan, and by decomposition of surface water organic matter from the same lake. Rate constants of urea production were 0.083 per day for F. crotonensis and 0.051 per day for the organic matter. Urea production reached a peak in the Fragilaria experiment at 5 weeks and then declined toward the eighth week, a possible result of urease activity. Urea levels in the surface organic matter experiment reached a peak at 4 weeks and did not drop. This study shows that urea may be produced in natural waters by decomposition of organic matter as well as by the well-known processes of excretion by aquatic animals and human pollution. DIFFERENCE IN THE COMPOSITION OF LINEAR ALKYLBENZENE SULFONATE HOMOLOGUES IN RIVER SEDIMENT AND RIVER WATER,
Tokyo Metropolitan Univ. (Japan).
H. Hon-nami, and T. Hanya.
Japanese Journal of Limnology, Vol 41, No 1, p 1-4, January, 1980. 3 Fig, 2 Tab, 6 Ref.

Descriptors: *Rivers, *Alkylbenzene sulfonates, *Sediments, *Water pollution sources, Detergents, Japan, *Tama River(Japan), Organic compounds.

The composition of linear alkylbenzene sulfonate homologues in surface sediment and water of the Tama River showed unusual differences. In sediment the proportions of C12 and C13 were higher, and the C10 and C11 lower than those in the water. In fact, very little C10 appeared in the sediment. C14 was detected at 1.7% in only one sediment sample, none in water. Total alkylbenzene sulfonate concentrations in sediment were 50 to 500 times as high as in water. As the carbon number of the alkyl groups increased, the ratio of concentration of alkybenzene sulfonates in sediment to that in water increased exponentially. The authors explain this distribution of alkyl groups by stating that the longer the alkyl chain length, the more alkylbenzene sulfonates were adsorbed in the sediment. (Cassar-FRC)

CITY EXAMINES EFFECTS OF ROAD SALTING ON ITS WATER SUPPLY,
Massachusetts Dept. of Public Works, Worcester.
R. L. Moyland, Jr.
Public Works, Vol 111, No 8, p 59-60, August, 1980.

Descriptors: *Urban runoff, *Salt, *Reservoirs, Urban areas, Water quality, Deicers, Potable water, Sodium compounds, Winter, Highways, *Highway icing, Massachusetts.

The effect of winter salting on the water quality of Worcester, Massachusetts, and the locations where salt could be entering the water supply were investigated. Worcester's water supply is made up of ten surface reservoirs and two gravel packed wells located outside of or on the edge of the city. No runoff from within the city runs into the surface water supply. Roads near the reservoirs are salted and sanded, but sodium readings on the reservoirs indicate no salt contamination. Urban runoff does flow into the Lake Quinsigamond basin, where the one well in use is located. Sodium levels in the well are 26 mg/liter, a moderate level for groundwater. Runoff which flows into the Blackstone River does not enter Worcester's or any other city's drinking supply. The Worcester Department of Public Works has limited the use of salt to streets which are critical to moving traffic through the city. Residential streets are excluded. Uniform application is achieved through the use of automatic spreaders, and salt supplies are kept covered and secured. The department recommends the continued use of road salt. (Small-FRC)

PREDICTION OF THE VOLATILIZATION RATES OF HIGH-VOLATILITY CHEMICALS FROM NATURAL WATER BODIES,
SRI International, Menlo Park, CA.
J. H. Smith, D. C. Bomberger, Jr., and D. L. Haynes.
Environmental Science & Technology, Vol 14, No 11, p 1332-1337, November, 1980. 4 Fig, 4 Tab, 31 Ref.

Descriptors: *Path of pollutants, *Volatilization, *Evaporation, *Atmospheric water, Organic compounds, Water pollution, Water pollution sources, Equations, Mathematical studies, Waste water treatment, Natural streams, Surfactants, Diffusion.

The transport of pollutants from water bodies to the atmosphere by volatilization or evaporation may be an important environmental fate pathway for many chemicals. A simple laboratory procedure which has been used to obtain volatilization rate data for benzene and several chlorinated hydrocarbons is described. The method measures the ratio of the evaporation rate constant of the pollutant to the oxygen reaeration rate constant. This ratio has been shown to be constant for volatile compounds subjected to a wide range of conditions. If the oxygen reaeration rate constant can be estimated or measured in a waste water treatment system or in a natural water body, then the volatilization rate constant of the compound under those same conditions may be calculated by multiplying the value of the ratio by the environmental value of the oxygen reaeration rate constant. The effects of diffusion surfaces and surfactants are also considered. Results indicated that many low-molecular-weight, nonpolar compounds will undergo volatilization as their major environmental fate pathway. (Geiger-FRC)

5C. Effects Of Pollution

AN EVALUATION OF LIME TREATMENT AND SAND DRYING BEDS FOR UPGRADING STABILIZATION POND EFFLUENT,
Dept. of Civil Engineering. Mississippi State Univ., Mississippi State.
J. R. Taylor.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-167223, Price codes: A11 in paper copy, A01 in microfiche. MS Thesis, August 1980. 229 p, 46 Fig, 26 Tab, 44 Ref, 8 Append. OWRT-A-110-MISS(2), 14-34-0001-8026.

Descriptors: *Cyanophyta, *Salt marshes, Biological communities, Ecological distribution, Light intensity, Bulrush, Mississippi, Biogeography, *Algal control, Sludge treatment, *Lime treatment, Ponds, Effluents, Dewatering, Drying, Sand drying beds, *Edaphic algae, *Graveline Bay Marsh(MS), Schizothrix, Spartina, Juncus, Distichlis.

Removal of algae from stabilization pond effluents is required for the effluent to meet current federal discharge standards. Application of a thickened lime-algae sludge to sand drying beds was investigated as a treatment method. The sludge was loaded at rates of 4.0 to 16.1 gal/sq ft to sand bed columns with media depths of 6 to 12 inches. A sludge cake with an average 25% solids content was obtained within ten hours at bed depths of 6 to 10 inches over the loadings applied, while 65 hours were required for a bed depth of 12 inches at loadings above 12 gal/sq ft. Investigations indicated that dewatering rate and effluent quality were not related to media size from 0.3 to 1.5 mm. Dewatering rates decreased with increasing solids loading from about 1 to 6 lbs/sq ft; however, effluent quality and sludge cake solids depended more on sludge mat formation than on loading. Dewatering rates above 1 gal/sq ft per hr were noted at a bed depth of 10 inches. Effluent suspended solids from the drying beds averaged about 80 mg/l. Supernate withdrawal was effective only when high sludge loadings and/or deep bed depths caused filter binding. In addition, the supernate averaged 175 mg/l of total suspended solids, which would require recirculation to the lagoon.

CADMIUM IN FOREST ECOSYSTEMS,
Pennsylvania State Univ., University Park. Inst. for Research on Land and Water Resources.
W. E. Sopper, and S. N. Kerr.
In: Cadmium in the Environment, Pt I, J. O. Nriagu (Ed), John Wiley & Sons, Inc., 1980, Ch 17, p 655-667, 7 Tab, 18 Ref. OWRT-B-083-PA(3), 14-34-0001-5109.

Descriptors: *Cadmium, *Ecosystems, *Vegetation, Metals, Public health, Toxicity, Trees, Irrigation, Soils, Effluents, Cation exchange, Waste water disposal, Irrigation, Water pollution effects, *Forests, *Wastewater quality, Gamelands, Metal concentrations.

Data have been presented showing levels of cadmium in forest vegetation and soils subjected to wastewater irrigation for 16 years. In the old field areas white spruce, goldenrod, and wild strawberry showed no increase in cadmium levels due to wastewater irrigation. Cadmium concentrations in all species were lower in the wastewater-irrigated area than in the control area because of the greater biomass production resulting from the irrigation. This provides evidence that under low cadmium applications in a wastewater disposal system the actual cadmium concentration of some herbaceous vegetation may be decreased. None of the species sampled in the old gamelands area showed a significant increase in cadmium levels as a result of the wastewater irrigation. Soil cadmium status was not significantly affected by wastewater irrigation in either area, except for the increase in cadmium concentration at the 0 to 5 cm depth in the irrigated old gamelands area. Cadmium levels decreased with depth in the soil profile in both treated and control areas. On the basis of information currently available it appears that the introduction of cadmium into forest ecosystems as an indirect result of industrial pollution or through the planned application of municipal wastewater and sludge will have a minimal effect.

MAXIMUM UTILIZATION OF WATER RESOURCES IN A PLANNED COMMUNITY; EUTROPHICATION POTENTIAL OF SURFACE WATERS IN A DEVELOPING WATERSHED,
Rice Univ., Houston, TX. Dept. of Environmental Science and Engineering.
C. H. Ward, and J. M. King.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-107138, Price codes: A05 in paper copy, A01 in microfiche. Environmental Protection Agency Report EPA-600/2-80-127, August, 1980. 97 p, 29 Fig, 22 Tab, 19 Ref, 1 Append. 802433.

Descriptors: *Eutrophication, *Urbanization, *Algae, *Water pollution, Texas, Water resources development, Stormwater, Low flow, Soil algae, Phosphorus, Nitrogen, Nutrients, Aquatic algae, Community development, Surface drainage, Soil chemistry, Leachate, *Community development, Planned community.

The algal populations in The Woodlands, Texas, were characterized to evaluate the impact of urbanization on the aquatic flora. Several aquatic habitats were sampled on a regular basis to identify factors which influence algal population dynamics. Nutrient limitation studies were conducted to determine which nutrient was most limiting for algal growth during conditions of low flow and stormwater runoff. Water from Hunting Bayou and Westbury Square, developed communities near Houston, Texas, were used in bioassay experiments. The impact of urbanization on edaphic algal populations was also determined. Nutrient limitation studies in Panther Branch and the Conference Center Lakes showed that phosphorus additions to low-flow water increased algal cell yields, while yields in stormwater samples were increased by nitrogen additions. Undisturbed soils had more diverse algal populations, but smaller standing crops, than disturbed soils, even though concentrations of nitrogen and phosphorus were higher than in most disturbed soils. Soil disturbance caused development of a more diverse blue-green algal flora, probably due to accompanying increases in soil pH. Bioassays showed that phosphorus was the nutrient most limiting for algal growth in water leachates of soils. (Moore-SRC)

WATER QUALITY AND BIOLOGICAL EFFECTS OF URBAN RUNOFF ON COYOTE CREEK; PHASE I - PRELIMINARY SURVEY,
Woodward-Clyde Consultants, San Francisco, CA.
R. Pitt, and M. Bozeman.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-144487, Price codes: A05 in paper copy, A01 in microfiche. Environmental Protection Agency Report EPA-600/2-80-104, August 1980. 81 p, 9 Fig, 35 Tab, 20 Ref, 1 Append. R805418.

Descriptors: *Urban runoff, *Water quality, *Water pollution, *Aquatic life, California, Sediments, Water chemistry, *Environmental effects, Lead, Zinc, Fish, Aquatic algae, Aquatic plants, Invertebrates, Streamflow, Roads, Surface runoff, Nitrites, Ammonia, Sulfates, Silts, San Jose(CA), Coyote Creek(CA).

An evaluation of the receiving water effects of urban runoff is necessary before urban runoff control goals and practices can be established and selected. Coyote Creek, near San Jose, California, receives minimal pollutant discharges, upstream and in the study area, except for urban runoff. The parameters generally analyzed at each sampling station include: fish; benthic organisms; attached algae; rooted aquatic vegetation; sediment size distribution; sediment chemistry; biological tissue analyses for lead and zinc. Receiving water chemistry, runoff water chemistry and yields, and hydrology were also studied for Coyote Creek. Sources of urban runoff pollutants are being investigated and include sampling from source areas such as street surfaces, parking areas, landscaped areas and rooftops. A marked increase in nitrites, ammonia, turbidity, chlorides and specific conductance was found as the creek passed through the urbanized area of the watershed. Sediment samples from urban areas contained higher concentrations of many of the parameters as compared to the non-urban samples. Sulfates, lead, and orthophosphates were notable examples. Much more silt was also found in the urban samples, signifying a greater discharge of finer sediments from the urban area. Lead concentrations in urban samples of algae, crayfish and cattails were 2 to 3 times greater than in non-urban samples, while zinc concentrations were 3 times the non-urban sample concentrations. The non-urbanized section of the creek supports a comparatively diverse assemblage of aquatic organisms including at least 12 species of fish and various benthic macroinvertebrate taxa. The urbanized portion of the stream supports an aquatic community that is generally lacking in diversity

and is dominated by pollution tolerant fish and benthic invertebrates. (Moore-SRC)

HANDLING OF COMBUSTION AND EMISSION-ABATEMENT WASTES FROM COAL-FIRED POWER PLANTS: IMPLICATIONS FOR FISH AND WILDLIFE RESOURCES,
Argonne National Lab., IL. Div. of Environmental Impact Studies.
L. F. Soholt, R. W. Vocke, N. J. Beskid, W. K. Derickson, and M. J. Knight.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-158917, Price codes: A09 in paper copy, A01 in microfiche. Fish and Wildlife Service, Office of Biological Services, National Power Plant Team Report FWS/OBS-80/33, September, 1980. 184 p, 25 Fig, 51 Tab, 333 Ref, 3 Append.

Descriptors: *Wildlife, *Waste disposal, *Powerplants, *Environmental effects, Landfills, Sludge disposal, Revegetation, Water pollution sources, Trace elements, Solid wastes, Fly ash, Toxic substances, Power plant aggregate, Flue gases, Coal, Energy, Effects.

The goals of this report are to: provide a basic introduction to handling of wastes from coal combustion and emission abatement; and present a procedure for evaluating the potential for these wastes to impact fish and wildlife resources. Coal combustion ashes and flue-gas-desulfurization (FGD) sludges, the solid waste products from coal-fired facilities, contain a number of trace elements that can be toxic to biota if they are available in sufficient quantities. Both ashes and FGD sludges are usually deposited in pond or landfill storage areas. Dispersal of constituents from waste-storage sites occurs primarily by runoff, seepage, and wind erosion. Generally, pond storage methods, even when properly managed, have a greater impact upon fish and wildlife resources than do landfill methods. Proper management of storage sites reduces the amount of waste constituents that are dispersed into the environment. The potential for uptake of trace elements to toxic levels is dependent upon a number of factors including: pH of the dispersal and growth media; capacity of the dispersal and growth media to bind elements in a form unavailable for uptake; magnitude of biological concentration of elements in primary producers and succeeding trophic levels; and tolerances of individual species. After the active lifetime of a waste-storage site, revegetation is desirable as a means of controlling erosion and regaining potential fish and wildlife habitat. Four model waste-storage sites are used to illustrate the methods of assessment presented in this report. (Moore-SRC)
W81-01688

TRANSMISSION OF VARIOUS SALMONELLAE AMONG FISH (CRASSIUS AUTATUS) IN THE AQUATIC ENVIRONMENT,
Purdue Univ., Lafayette, IN.
R. L. Lawton.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-173767, Price codes: A04 in paper copy, A01 in microfiche. Master of Science Thesis, 1979. 56 p, 2 Fig, 10 Tab, 54 Ref. OWRT B-076-IND(9).

Descriptors: *Salmonella, *Aerobic bacteria, *Aquatic environment, *Fish, Water pollution, Eutrophication, Effects, Bottom sediments, *Fish diseases, Infection.

The infection rates of various Salmonella serotypes for goldfish (C. auratus) were evaluated under a number of controlled environmental conditions. Studies were undertaken to determine the number of salmonellae necessary to cause infection, and to elucidate the conditions instrumental to the pathogen's continued persistence in the aquatic environment. All 32 strains (representing 12 serotypes of Salmonella) studied were shown to infect C. auratus. Under appropriate physiological conditions, the fish were infected for a period of two weeks with less than one organism/ml water (based on MPN analysis). Physiological stress to the fish augmented infection rates. Increased eutrophy was correlated with lowered infection rates and decreased survival of the pathogen. The presence of a bottom sediment under these same eutrophic conditions produced infections of six weeks duration. Isolation of salmonellae from the gastrointestinal tracts of the fish suggested that colonization of the fish viscera occurred in these experiments. A cycle of reinfection, i.e. fish to water to fish, could have taken place. The presence of fish constituted an important element for the survival of Salmonella in freshwater.

ENVIRONMENTAL CONTROL OF PITHOPHORA OEDOGONIA (CHLOROPHYCEAE) AKINETE GERMINATION,
Purdue Univ., Lafayette, IN. Dept. of Botany and Plant Pathology.
D. F. Spencer, T. R. Volpp, and C. A. Lembi.
Journal of Phycology, Vol 16, p 424-427, 1980. 3 Fig, 3 Tab, 16 Ref. OWRT B-081-IND(3).

Descriptors: *Algae, *Cladophora, *Germination, *Environmental control, Akinete, Lakes, *Indiana, Cladophorales, Filamentous, Green algae, Life cycles, Pithophora, Spores, Nutrients, Temperature, *Surrey Lake(IN).

Abundance of Pithophora oedogonia akinetes displayed seasonal changes, being greatest in winter and lowest in summer. Akinete abundance showed significant ($P<0.001$) negative correlations with photoperiod ($r = -0.53$) and water temperature ($r = -0.75$) during the period February 1978 through June 1979. Experiments in which akinete germination was studied in response to manipulations of nutrients (NO sub 3 -N and PO sub 4 -P), photoperiod and temperature indicated that temperature was the primary factor regulating the timing of the vernal flush of akinete germination observed in Surrey Lake.
W81-01699

EPIFAUNAL INVERTEBRATES AS MONITORS OF WATER QUALITY IN LAKE PONTCHARTRAIN,
New Orleans Univ., LA. Dept. of Biological Sciences.
M. A. Poirrier.
In: Proceedings, Third Coastal Marsh and Estuary Management Symposium. p 105-111. Louisiana State University Division of Continuing Education, Baton Rouge, LA, 1979. J.W. Day, Jr., D.D. Culley, Jr., R.E. Turner, and A.J. Mumphrey, Jr., eds. OWRT-A-041-LA(2).

Descriptors: *Water pollution effects, *Aquatic life, *Lakes, Louisiana, New Orleans(LA), *Lake Pontchartrain(LA), Physicochemical properties, Chemical analysis, Bioindicators, Invertebrates, Pollutant identification, Water quality, Estuarine environment.

The distribution and abundance of epifaunal invertebrates was investigated as a means of assessing and monitoring the impact of adverse water quality upon aquatic life. Species zonation along pollution and salinity gradients in Lake Pontchartrain was studied. Many species occurred in zones along these gradients, indicating a relationship between water quality and distribution, and hence, potential as indicator species. Computer principal components and discriminant functions analyses were used to establish species groups and to compare the distribution of these groups with water quality paramenters. As in other studies, the number of species decreased along pollution gradients and highly polluted habitats were dominated by tolerant, opportunistic forms. Salinity was found to be the factor most highly correlated with species distribution. Several species appeared to be good salinity indicators because of changes in abundance and morphology along salinity gradients. Taxonomic and life history studies were conducted and numerous new distributional records established. Studies on the impact of the 1973 and 1975 Bonnet Carre Spillway opening were also conducted.

VIEWS OF A PROMINENT CONSERVATIONIST,
Victoria Univ. (British Columbia).
R. Haig-Brown.
In: Pollution and the Fisheries: Proceedings 27th Annual Meeting of the Fisheries Council of Canada, Environmental Protection Service Report No EPS-3-WP-73-4, August, 1973, p 3-12.

Descriptors: *Water pollution effects, Water quality, Oceans, *International waters, *Commerical fishing, *Aquatic life, *Conservation, Effects, Fishkill, Radioactivity effects, Toxicity, Water pollution, Water quality control, International waters, Bodies of water, Estuaries, Lagoons, Marine fisheries, Pesticides drift, Oil spills, Water pollution sources, Wastes, Chemical wastes, Fish toxins, Fish populations.

Water pollution in world-wide terms was discussed, including some assessment of the risks of degrading the oceans themselves. The risk and possibility of degrading the oceans and largely destroying their present potential values is very real without some change in present trends. Broad-scale pollution already exists through fallout of pesticides and nuclear and industrial wastes. To illustrate, Russia has reported significant levels of strontium-90 in pelagic fish eggs in the Black Sea. Long-lived pollutants (pesticides, radioactive substances) can disperse over thousands of miles, and eventually through the entire general system of the ocean. Ocean transportation of oil and deep sea mining represent additional threats. Pollution in rivers, river estuaries, lagoons, saltmarshes, shallow seas, and out over the continental shelf, compound the problems. In a major Canadian estuary (the Fraser), one of the world's greatest salmon producers, daily loadings of 129 million gallons of chlorinated sewage are proposed. Vigilance on the part of coastal States, as well as international guidance and standards are needed. It was concluded that, should pollution continue at its present rate, the best estimate of continuing ocean life is between 50-100 years. (Zielinski-IPA)

GOVERNMENT PHILOSOPHY AND ACTIVITIES,
P. M. Higgins.
In: Pollution and the Fisheries: Proceedings, 27th Annual Meeting of the Fisheries Council of Canada, Environmental Protection Service Report No EPS-3-WP-73-4, August, 1973, p 13-21.

Descriptors: *Water pollution control, *Water law, *Canada, *Fisheries, *Fish toxins, Pollution abatement, Planning, Legal aspects, Administrative decisions, Constitutional law, Legislation, Water policy, Water quality, Water quality control, Water pollution sources, Water pollution, Foreign countries, Geographical regions, Regions, North America, Governments.

The Canadian Federal Fisheries Act, one of the first Acts of Parliament, was recently amended to significantly strengthen pollution control provisions. Section 33, subsection 12, provides that 'the Governor in Council may make regulations prescribing: (1) substances and classes of substances; (2) quantities, or concentrations of substances; (3) treatments, processes and changes of water.' Pollution control program alternatives and development of regulations were discussed. It was concluded that the effluent regulations for fish processing plants being developed under Section 33 of the Fisheries Act will contain a number of important ingredients: (1) maximum requirements for uniform national application that may be superseded by more stringent local requirements where appropriate; (2) incorporation of practical (economic/technologic) recycling/recovery technology expressed in terms of permissible limits of substances (quantity/production units); (3) development by joint Federal/provincial/industry liaison and reviewed individually with Provincial Pollution Control Agencies; (4) initial immediate application to all new installations and by individually-negotiated time schedules for existing facilities; and (5) dynamically reflect the state of pollution control technology through periodic review. (Zielinski-IPA)

he suitability of Rhine water for the preparation f drinking water was examined in four experi-ents. Experiment A determined the chronic toxic uality of Rhine water and its effects on rainbow out. Experiment B determined that the mortality f rainbow trout eggs was higher in Rhine water, nd that the water was acutely toxic to juvenile out. Experiment C, on the induction of cytoge-etic effects of Rhine water in fish, found evidence at strongly suggests the Rhine water contained ubstances which were able to induce chromosome reaks in the gills of the eastern mudminnow. xperiment D, on the induction of mutations in acteria by Rhine water, found that aromatic hy-rocarbon fractions increased the number of muta-ons. The significance of these results to the prepa-ation of Rhine water for drinking by humans is ot yet known. (Small-FRC)

Acta Hydrobiologica, Vol 22, No 2, p 191-215, 1980. 10 Fig, 5 Tab, 83 Ref.

Descriptors: *Nida River(Poland), *Diptera, *Dominant species, *Water pollution effects, *Rivers, *Biological communities, Aquatic animals, Aquatic insects, Poland, Tributaries, Self-purification, Water purification, Habitats, Aquatic habitats.

The distribution and structure of Chironomidae communities in the River Nida (Poland) and its tributaries was studied on 17 dates at 11 stations during 1973-1975. Municipal and industrial wastes in the middle sector of the river system decreased the number of specimens and disturbed the domination structure. Tubificidae prevailed in polluted waters, while Naididae occurred in pure waters. At some stations in the polluted section a domination structure did not develop at all. As self-purification improved conditions downstream, domination structuures again appeared. In all, 148 taxonomic units were identified. (Cassar-FRC)

Descriptors: *Outfall sewers, *Benthic fauna, *Sewage, *Bioindicators, *Bays, Ecosystems, Sedimentology, Water pollution effects, Aquatic life, Europe, Isle of Elba, Italy.

The distribution of the Bryozoa population (Cheilistomata) in a bed of posidonia along the coast of the Isle of Elba close to a small sewage outfall was studied. During the two years of the study, random samples were taken from the leaves and rhizomes of Posidonia oceanica, and the sediments under the beds were evaluated by oxidation with H2O2. The bryozoological populations in the posidonia beds were stable over the study period. An attempt was made to relate the type of fauna with the type of sediment, but without useful results. Two years of a small sewage discharge was not sufficient to alter the ecology of the bay. The research did reveal the complexity of the benthic ecosystem. Seventeen Anasca and 29 Ascophora were found. Also, within the bed there were two different populations, corresponding to the deepest and shallowest areas, both for the bryozoa present on the rhizomes and for those on the leaves. (Small-FRC)

TOXICITY OF LANDFILL LEACHATES,
Babichuk Construction Ltd., Calgary (Alberta).
R. D. Cameron, and F. A. Koch.
Journal of the Water Pollution Control Federation, Vol 52, No 4, p 760-769, April, 1980. 5 Fig, 7 Tab, 14 Ref.

Descriptors: *Toxins, *Leachate, *Landfills, Bioassay, Rainbow trout, Water analysis, Filtration, Coagulation, Lime, Ammonia, Copper, Hydrogen ion concentration, Toxicity.

Landfill leachate toxicity was reviewed by examining the results of several studies on natural leachates and synthetic leachates. Most toxicity analyses were conducted at independent testing laboratories using either the standard static 96-hour bioassay or the residual oxygen bioassay technique. Rainbow trout were the test organism in all experiments. Leachate toxicity varied over a wide range: from less than 16% to 100%. When leachates were treated by filtration through columns of natural peat or by lime coagulation followed by peat filtration, leachates were non-toxic. Most pollutants were reduced 85 to 99% by the two treatment processes. Over 94% of the observed toxicity was explained by un-ionized ammonia, tannin, copper, and hydrogen ion concentration. All natural leachates tested were found to be highly toxic within the confines of the landfill and usually after stream discharge. (Small-FRC)

EFFECTS OF HEATED EFFLUENT ON THE REPRODUCTIVE BIOLOGY OF WHITE CRAPPIE, POMOXIS ANNULARIS IN CONOWINGO POND, PENNSYLVANIA,
Radiation Management Corp., Drumore, PA. Muddy Run Ecological Lab.
D. Mathur, and P. L. McCreight.
Archiv fur Hydrobiologie, Vol 88, No 4, p 491-499, June, 1980. 2 Fig, 12 Ref.

Descriptors: *Nuclear powerplants, *Thermal pollution, *Fish reproduction, *Sunfishes, Gonads, Spawning, On-site investigations, Ponds, Pennsylvania.

The effects of heated effluent from the Peach Bottom Atomic Power Station on the reproductive biology of fishes, including altered spawning time and abnormal development and hatching of eggs, were examined. The water temperature in the plume averaged 5.6 to 11.1 degrees C above the ambient temperature. There was some variation in the gonosomatic index of fish, but the reproductive cycle remained similar to other years. Other researches have found some indication of interruption and biomodality in spawning of fish exposed to heated waters. In this study there was no evidence of earlier spawning in the thermal plume, using gonosomatic ratios and larval fish catches as indicators. Temperature at peak spawning was similar to other years and other areas. The gonosomatic ratios of crappie collected in the thermal plume were slightly lower than those from ambient areas. The gonosomatic ratio equals the weight of the ovaries divided by the weight of the fish minus the weight of the ovaries, times 100. (Small-FRC)

PARAMETRIC ANALYSES OF MORTALITY RATES IN BIOASSAYS,
Organisatie voor Toegepast Natuurwetenschappelijk Onderzoek, Delft (Netherlands).
S. A. L. M. Kooijman.
Water Research, Vol 15, No 1, p 107-119, January, 1981. 7 Fig, 12 Tab, 15 Ref.

Descriptors: Mathematical models, *Bioassay, Toxicity, *Mortality, Toxins, Water pollution, Water pollution effects, Model studies, *Aquatic life, Sampling, Metabolism, Pesticide residues, Theoretical analysis.

Some parametric analyses of results of several bioassays in which several groups of organisms are exposed to a range of concentrations of test compounds are described. The main application of the analyses is in aquatic toxicity tests, although they sometimes may be useful in mammalian toxicology studies. The theory presented is based on the principle of maximum likelihood, and the concentrations of toxins are chosen so that at least one group

of organisms suffers significant but not excessive mortality. A large sample technique is employed to mathematically estimate the no effect level, the small effect level and the ultimate effect level of the test compound. The relevance of LC50 values in toxicity tests and hazard evaluations is considered. Procedures for the determination of accumulation and elimination behavior of test compounds through mortality information are given. A method is outlined for calculating the disappearance rate of a test compound in a semistatic bioassay from the mortality rates of the test species. The theory has been applied to toxicity tests on various aquatic species using cupric chloride, cadmium chloride, pentachlorophenol, 1,2,3-trichloropropane, para-chlorophenol and an industrial waste (DSB) as aquatic pollutants. A FISH-KILL IN HEART LAKE, ONTARIO, ASSOCIATED WITH THE COLLAPSE OF A MASSIVE POPULATION OF CERATIUM HIRUNDINELLA (DINOPHYCEAE),
Ontario Ministry of the Environment, Rexdale. Limnology and Toxicity Section.
K. H. Nicholls, W. Kennedy, and C. Hammett.
Freshwater Biology, Vol 10, No 6, p 553-561, December, 1980. 4 Fig, 28 Ref.

Descriptors: *Fishkill, *Destratification, *Water pollution effects, *Eutrophication, Ceratium hirundinella, Dinoflagellates, *Heart Lake(Ontario), Anaerobic conditions, Fish harvest, Aeration, Stratification, Aquatic algae, Recreation, Chlorophyta, Phytoplankton, Dissolved oxygen, Lakes, Limnology, Zooplankton, Canada.

During early August, 1976, a population of the dinoflagellate, Ceratium hirundinella, grew to a maximum level of 53 cu mm per liter in waters of Heart Lake, Ontario, a recreational lake which experienced blooms of blue-green algae. The lake has a history of enrichment from nearby duck farms. Artificial destratification by aeration was done for about 6 months beginning in June 1975 and again starting in April 1976. This process effectively inhibited algal bloom, but promoted oxidation and mineralization of organic matter on the lake bottom, raising levels of total phosphorus, soluble phosphorus, and organic nitrogen. These nutrients, the lack of competition from other algae, and the absence of organisms to feed on these larger cells permitted the dinoflagellates to grow rapidly. The biomass collapsed suddenly, causing oxygen depletion and killing more than 600 fish--rainbow trout, black bass, and bullheads. It is believed that inorganic nitrogen depletion started the collapse, which accelerated rapidly as decomposing cells depleted dissolved oxygen. (Cassar-FRC)

ABNORMALITIES IN THE TRACHEAL GILLS OF AQUATIC INSECTS COLLECTED FROM STREAMS RECEIVING CHLORINATED OR CRUDE OIL WASTES,
New York State Dept. of Health, Albany. Div. of Labs. and Research.
K. W. Simpson.
Freshwater Biology, Vol 10, No 6, p 581-583, December, 1980. 1 Fig, 18 Ref.

Descriptors: *Aquatic insects, *Water pollution effects, *Oil pollution, Chlorine, Gills, Stoneflies, Caddisflies, New York, Allegheny River(New York), Gooseberry Creek(New York), Treatment facilities, Streams.

Aquatic insects collected in two streams in New York State showed tracheal gill alterations. At Gooseberry Creek, downstream from a treatment plant discharging chlorinated effluent, branches were absent or incomplete in gills in stonefly nymphs. Caddisfly larvae were greatly reduced in number, and 10 of 12 specimens had damaged gills. Sampling in the Allegheny River, which has a history of crude oil contamination, yielded 18 out of 40 caddisfly specimens with tar specks on their gills and 6 with completely tarred gills. All damaged specimens were smaller than normal and were living in water with high dissolved oxygen concentration. It is not known whether these individuals could have successfully completed their life cycles. Tracheal gill changes may be useful for documenting effects of toxic materials on freshwater fauna. The effect of light on phosphate uptake by aquatic microorganisms was studied in Ebrie Lagoon, Ivory Coast, West Africa. This body of water, about 550 sq km in area and with a mean depth of 3 meters, experiences tidal intrustions and sewage discharges from a city of 1 million. Phosphate uptake varied at the different stations sampled, but was classified into 3 general groups: light uptake differed from dark uptake and followed light variations; uptake was stimulated by light, but did not follow its variations; and light uptake equaled dark uptake. Phosphate uptake showed a 24 hour rhythm, with the highest uptake in the early morning and the lowest in the late afternoon. The maximum phosphate uptake rate was independent of light intensity when light energy was higher than a limit value. Phosphate uptake appeared to depend on the depletion of dissolved inorganic phosphate and on the ATP concentration in the seston. Two examples of luxury uptake of carbon were observed in a nutrient depleted station, and 1 case of luxury phosphate uptake was seen during phosphate excess. (Cassar-FRC)

Descriptors: *Mine wastes, *Water pollution effects, *Benthic fauna, *Mayflies, Diptera, Metals, *Nagasaki, Japan, Se River(Japan), Sasu River(Japan), Zinc, Aquatic life, Heavy metals, Rivers, Seasonal.

Discharge from a zinc mine affected the benthic fauna in the Sasu River in winter. In summer, numbers of individuals and species increased, the heavy metals content of the water increased, and the heavy metals in the mud decreased. Predominant fauna were Ephemeroptera in summer and Chironomidae in winter. In the Se River, the dominant species in winter and summer were the reverse of those in the Sasu River. All sampling stations showed rich animal life in summer and winter. However, the patterns of species observed changed from season to season. (Cassar-FRC)

TOXICITIES OF MICROCYSTIS AERUGINOSA COLLECTED FROM SOME LAKES, RESERVOIRS, PONDS AND MOAT IN TOKYO AND ADJACENT REGIONS,
Tokyo Metropolitan Research Lab. of Public Health (Japan).
M. F. Watanabe, and S. Oishi.
Japanese Journal of Limnology, Vol 41, No 1, p 5-9, January, 1980. 5 Tab, 10 Ref.

Descriptors: *Algae, *Toxicity, *Eutrophication, Water pollution effects, Cyanophyta, Microcystis aeruginosa, Surface waters, Tokyo, *Japan, *Lakes, Reservoirs, Ponds, Aquatic algae, Algal toxins, Potable water.

Microcystis aeruginosa, a blue-green alga observed in eutrophied waters, was harvested from lakes, reservoirs, ponds, and moats in and near Tokyo. Mice were injected intraperitoneally with 0.2 ml of the crude, heat-treated algae extracts and with extracts treated to destroy protein components. Crude algae extracts from 5 of 10 bodies of water caused death in mice in 1 to 2 hours. Toxicity was decreased by pepsin treatment of the extracts and eliminated by trypsin treatment, suggesting that the toxin is a heat-stable peptide or protein. In a dilution test 50 mg per ml was the minimum lethal dose, corresponding to 330-400 mg per kg. (Cassar-FRC)

RESOLUTION OF AN INDUSTRIAL WASTE DILEMMA,
Quicksall (W. E.) and Associates, Inc., New Philadelphia, OH.
J. R. Morgan.
Public Works, Vol 111, No 8, p 57-59, August, 1980. 3 Fig.

Descriptors: *Nitrates, *Industrial wastes, *Sludge, Treatment facilities, *Skimming, Performance, Waste water treatments, *Floating sludge, Rubber extrusion, Curing agent.

Problems with floating sludge caused by an unknown industrial waste caused BOD and suspended solids removal levels to deteriorate at the waste water treatment facility at New Philadelphia, Ohio. The amount of floating sludge in the primary clarifiers was much greater in the summer months, but the process was more seriously affected during the winter months. Manual skimming was the only way to really remove the floating sludge. Excess nitrates, higher than 1000 mg/liter in the influent, seemed to be the cause of the sludge. The trunk sewer area responsible for the excess nitrates was located and the offender was found to be a small rubber extruding industry. Potassium nitrate was used as a curing agent in the extrusion process. Initial efforts of the industry to control nitrate levels were not very successful. When the industry attempted to recover the salt, not only was the floating sludge problem solved, but the industry saved $20,000 per year. (Small-FRC)

Descriptors: *Acid streams, *Precipitation(Atmospheric), *Environmental effects, *Ecosystems, Acidic water, Ecosystems, Hydrogen ion concentration, On-site investigations, Diptera, Mayflies, Aquatic fungi, Water chemistry.

To simulate the effects of the increased acidity of rain on an ecosystem, dilute concentrations of sulfuric acid were added to Norris Brook, a stream in the Hubbard Brook Experimental Forest, West

Thornton, New Hampshire. The stream was maintained at pH 4 from April to September 1977. With increased acidity, stream water concentrations of the following were elevated: Al, Ca, Mg, K, and probably Mn, Fe, and Cd. There was decreased emergence of adult mayflies (Ephemeroptera), some stoneflies (Plecoptera), and some true flies (Diptera). The number and diversity of aquatic insects in collector, scraper, and predator functional groups decreased in drift. Aquatic hyphomycetes decreased, but the fungal community and periphyton biomass increased. Thus, the biotic structure, metabolism, and biogeochemistry of the stream ecosystem were altered at a pH level commonly found in precipitation. These findings are consistent with the hypothesis that heterotrophs may control biomass and primary production of attached plants in stream ecosystems by increasing energy transfer between primary and secondary trophic levels. (Small-FRC)

EVALUATION OF 19 ON-SITE WASTE TREATMENT SYSTEMS IN SOUTHEASTERN KENTUCKY,
Parrott, Ely, and Hurt, Lexington, KY.
J. L. Abney.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-111015, Price codes: A05 in paper copy, A01 in microfiche. Environmental Protection Agency Report EPA-600/2-80-101, July, 1980. 83 p, 18 Fig, 15 Tab, 15 Ref, 2 Append. CA-8-2575-A.

Descriptors: *Sewage disposal, *Rural areas, *Kentucky, *Sewage treatment, Prototypes, Septic tanks, Incineration, Soil properties, Operation and maintenance, Costs, Recycling, Safety, Public health, Social aspects, Performance, Incinerating toilets, Recycling toilets, Extended aeration tanks.

In 1970, many of the homes in rural Southeastern Kentucky were lacking adequate sanitary facilities for the disposal of human wastes. Shallow soils, steep slopes, and high groundwater levels made it difficult to provide sanitary wastewater disposal systems at a reasonable cost. Forty to sixty percent of the households had annual incomes of less than $3,000 in 1969. This report provides a summary of the design, installation, operation and maintenance, performance, and costs of nineteen prototype on-site systems installed in 1970-72. These systems included electric and gas-fired incinerating toilets, recycling toilets, extended aeration units followed by open sand filters, septic tanks followed by open sand filters, septic tanks followed by horizontal sand filters, and septic tanks followed by soil absorption trenches. In addition, the alternatives are evaluated against a set of criteria which includes user acceptance, health protection, safety energy requirements, longevity, frequency of maintenance, and capital and operation/maintenance costs. The septic tank-soil absorption systems were found to have the lowest cost and highest level of performance. Where suitable soils are located or can be economically imported, this would be the preferred system. (Moore-SRC)
W81-01681

AN ECONOMIC ANALYSIS OF EFFLUENT STANDARDS FOR BOD, AMMONIA, TOTAL SUSPENDED SOLIDS, AND DISINFECTION: CASE STUDY OF A MODERN TREATMENT PLANT,
Donald L. Hey and Associates, Chicago, IL.
D. L. Hey, J. M. Pappas, and L. C. Cox.
Illinois Institute of Natural Resources Document No 80/25, November, 1980. 46 p, 3 Fig, 22 Tab, 24 Ref.

Descriptors: *Waste water treatment, *Operating costs, *Treatment facilities, *Variable costs, Alternative planning, Analysis, Biochemical oxygen demand, Municipal wastes, Waste treatment, Waste water(Pollution), Waste water disposal, Water pollution, Water pollution treatment, Costs, Water management(Applied), Water quality control, Cost analysis, Economic efficiency, Ammonia, Suspended solids, Effluents, Standards.

Stricter effluent limits have economic effects in both capital and operating costs. Variable effluent limits will require the same capital facilities as fixed limits, but cost analysis of the Downers Grove treatment plant showed that operating cost for variable limits would be 21% less ($266,000 less) than for fixed limits. Controlling BOD variably (following the seasonal standards) would account for 12% ($33,000) of the savings; seasonal nitrification, 39% ($104,000); and elimination of chlorination, 44% ($108,000), saving 1.87 million kilowatt hours in the process. Reasons are given for the observation that the return on investment in variable (or fixed) effluent limits is uncommensurate with the operating or facility costs. It is recommended at maximum that variable limits be used to regulate the quality of treatment plant effluents. An alternate to variable limits operation would be instream treatment, operated on a regional scale, which, if deemed beneficial, would be less costly than nitrification facilities construction at all tributary plants, and would offer low-cost determination of water quality limitations to propagation of desirable aquatic organisms. (Zielinski-IPA)
W81-01701

THE PRESENT STATE OF POLLUTION CONTROL TECHNOLOGY FOR THE FISHING INDUSTRY,
Fisheries and Marine Service, Vancouver (British Columbia). Vancouver Lab.
F. G. Claggett.
In: Pollution and the Fisheries: Proceedings, 27th Annual Meeting of the Fisheries Council of Canada, Environmental Protection Service Report No EPS 3-WP-73-4, August, 1973, p 22-27.

Descriptors: *Fisheries, *Water pollution sources, *Water pollution treatment, *Canada, *Water pollution control, *Costs, Decontamination(Water), Treatment, Flotation, Filtration, Abatement, Application equipment, Biodegradation, Pollutants, Sewage treatment, Water pollution sources, Control, Industrial production, Alternative costs, Construction costs.

In light of developing environmental standards, four questions were discussed concerning the Canadian fishing industry: (1) are we polluting; (2) if so, to what extent, and what are the pollutants; (3) how much must be removed to meet the standards; and (4) which is the least expensive method. Answers to the first two questions are: yes, most of the larger plants are probably polluting; among the pollutants are fish particles, oil, blood, and slime which exert a biological oxygen demand on the receiving waters. The least degree of treatment demand will be physical removal of insoluble solids. Tangential screens can reduce the solids load by 50% after prescreening by trommel screens. A full-scale demonstration plant to treat waste water from fishing plants concentrates solids from 300,000 gallons/day into 6000 gallons of sludge, reducing the pollution load 80%. Further treatment alternatives are (1) waste water discharge to the municipal sewer system, or (2) use of an aerated lagoon. Tangential screen cost ($6000) can be recovered in two years; a 500 gallon/minute treatment plant costs about $75,000, and 15-25 cents/1000 gallons to operate; municipal sewer use (moderate size salmon canning plant), about $75/day user charges; a five-acre lagoon, $35,000, and about 8 cents/1000 gallons to operate. (Zielinski-IPA)
W81-01706

ENTEROVIRUS AND COLIPHAGE INACTIVATION DURING ACTIVATED SLUDGE TREATMENT,
New Mexico State Univ., Las Cruces. Dept. of Biology.
J. S. Glass, and R. T. O'Brien.
Water Research, Vol 14, No 7, p 877-882, July, 1980. 2 Fig, 6 Tab, 14 Ref. OWRT-A-052-NMEX(9).

Descriptors: *Viruses, *Bacteriophages, *Activated sludge, *Sludge treatment, Laboratory tests, Waste water treatment, Disinfection, Mathematical studies, Adsorption, Bioindicators, Model studies, Pilot plants.

The inactivation rates of enteric viruses and coliphages in a large volume activated sludge unit at New Mexico State University were examined in pilot plant studies. The fraction of total virus removed that was attributed to inactivation was also examined. Poliovirus 1, coxsackievirus B-1 and indigenous coliphage inactivation closely resembled first order kinetics with inactivation rates which were not dependent on flow rates of the mixed liquor. No significant differences were found between the enterovirus and coliphage inactivation rates indicating that phage inactivation might be used as an indicator for enterovirus inactivation during activated sludge treatment. Determinations were made of total virus removal from mixed liquor and an overall average rate constant for phage and virus inactivation was calculated. A plot of percent virus survival versus hours of exposure to activated sludge treatment was also generated. (Geiger-FRC)
W81-01708

CAPACITY OF ACTIVATED SLUDGE SOLIDS FOR VIRUS ADSORPTION,
California Univ., Los Angeles. Dept. of Chemical, Nuclear and Thermal Engineering.
V. L. Vilker, R. S. Kamdar, and L. H. Frommhagen.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-127210, Price codes: A04 in paper copy, A01 in microfiche. Chemical Engineering Communications, Vol 4, p 569-575, 1980. 3 Fig. (California Water Resources Center Project UCAL-WRC-W-523). OWRT-B-184-CAL(6).

Descriptors: *Waste water treatment, *Viruses, *Water reuse, *Activated sludge, Soil testing, Soil properties, Adsorption, Biological treatment.

The first significant reduction in wastewater virus concentration occurs in the biological treatment process, either by removal of solid matter in which virus is embedded or by adsorption of virus to the biomass. In addition, the effectiveness of subsequent disinfection and the ultimate fate of treatment plant effluent virus are dependent on the extent of virus association with small suspended particles. This report is a study of adsorption of Type I poliovirus to solids collected from an activated sludge unit and resuspended in filtered final effluent. Virus adsorption capacity was correlated by an isotherm relationship which includes the effect of decreasing capacity with increasing solids concentration. This effect is probably caused by decreased solids surface area due to solids aggregation. The results indicate smaller capacity at typical activated sludge mixed liquor solids concentration than would be predicted from previous studies, and that only about 20% of total virus are absorbed at low solids concentration typical for treatment plant effluent. (Snyder-California)

PROCESS FOR REMOVING SULFATE IONS FROM AQUEOUS STREAMS,
Du Pont de Nemours and Co., Wilmington, DE. (Assignee).
J. L. Balmat.
U.S. Patent No 4,200,523, 6 p, 1 Fig, 7 Ref; Official Gazette of the United States Patent Office, Vol 993, No 5, p 1744, April 29, 1980.

Descriptors: *Patents, *Waste water treatment, *Industrial wastes, *Separation techniques, Sulfates, Anaerobic conditions, Sulfur bacteria, Recycling.

Sulfate ions contained in aqueous streams essentially free of organic carbon such as sulfuric acid streams are converted into more recoverable form by subjecting the stream to the action of sulfate-reducing bacteria in an inorganic, anaerobic system in the presence of an excess of calcium carbonate and converting the resultant sulfide ions into an undissolved vapor or solid phase to facilitate recovery. (Sinha-OEIS)
W81-01713

BIO-SURFACE SEPARATION PROCESS,
Biospherics Inc., Rockville, MD. (Assignee).
G. V. Levin.
U.S. Patent No 4,200,524, 5 p, 1 Fig, 5 Ref; Official Gazette of the United States Patent Office, Vol 993, No 5, p 1745, April 29, 1980.

Descriptors: *Patents, *Waste water treatment, *Sewage treatment, *Separation techniques, Aeration, Biological treatment, Activated sludge, Microorganisms, Bio-surface particulates.

An activated sludge sewage treatment process comprises mixing influent sewage material with activated sludge and bio-surface particulates to provide a mixed liquor. The mixed liquor is passed to an aeration zone where it is contacted with an oxygen-containing gas to reduce the BOD content. The mixed liquor is then passed to a settling zone to separate bio-surface particulates having sludge particles adherent and a clarified supernatant. The clarified supernatant is removed from the settling zone and is discharged as effluent or routed for further treatment. At least a portion of the bio-surface particulates having adherent sludge is subjected to a treatment to separate at least of portion of the adherent sludge particles. The treated portion is then passed to a bio-surface particulate sludge separator. In this separator, the sludge present in the mixture which is not adherent to the bio-surface particulates separates and is passed out of the system as waste sludge. The bio-surface particulates and remaining sludge are then recycled for mixing with influent sewage material. (Sinha-OEIS)
W81-01714

PROCESS FOR TREATING WASTE WATER,
Gerber Products Co., Fremont, MI. (Assignee).
E. W. Johnson, M. J. Reider, R. Anewalt, and H. J. Kring.
U.S. Patent No 4,300,526, 6 p, 2 Fig, 7 Ref; Official Gazette of the United States Patent Office, Vol 993, No 5, p 1745, April 29, 1980.

Descriptors: *Patents, *Waste water treatment, *Industrial wastes, *Separation techniques, *Reverse osmosis, Reduction(Chemical), Flocculation, Filtration, Textiles, Fibers(Plant), Recycling.

Reverse osmosis treatment of the waste effluent from a textile plant is rendered feasible by first removing from the raw effluent as much of the pollutants as possible. After preliminary filtering to remove foreign particles, the waste water is treated with a reducing agent, if needed, and the pH adjusted to 8.0-9.5. The waste water is then treated with a flocculating agent. After further treatment in a clarifier, the waste water is passed through a sand filter to remove any residual suspended solids. The pH is adjusted to below about 6.0 and the waste water is then subjected to reverse osmosis. Approximately 90% of the raw effluent water has been found to be recovered for recycling. (Sinha-OEIS)
W81-01715

REMOVING METAL IONS FROM AQUEOUS EFFLUENTS,
PQ Corp., Valley Forge, PA. (Assignee).
V. J. Cassella, and M. R. Irani.
U.S. Patent No 4,200,528, 6 p, 1 Fig, 5 Tab, 7 Ref; Official Gazette of the United States Patent Office, Vol 993, No 5, p 1746, April 29, 1980.

Descriptors: *Patents, *Waste water treatment, *Industrial wastes, *Separation techniques, Ions, Metals, Chemical reactions, Tannery wastes, Chromium, Magnesium compounds, Product recovery.

The invention provides a method for removing various metal ions before waste effluents are released to the environment. Most particularly, the invention relates to removing and recovering chrome values from tanning effluents. Amorphous, hydrated magensium silicate is mixed with aqueous effluent. The slurry of magnesium silicate in the effluent is heated and/or adjusted in pH if desired. The metal ions (90% or more) are complexed by the silicate and effectively removed from the effluent by filtering off the silicate. The slurry of silicate and chrome tanning effluent is adjusted to and/or maintained at a pH of 5.3 to 9.8 to attain more than 90% removal of tri-valent chromium ions. Large proportions of the complexed metal ions can be recovered by acid treatment of the filtered material. (Sinha-OEIS)
W81-01716

APPARATUS FOR RENOVATION OF SANITARY WATERS,
F. Besik.
U.S. Patent No 4,200,534, 6 p, 1 Fig, 12 Ref; Official Gazette of the United States Patent Office, Vol 993, No 5, p 1748, April 29, 1980.

Descriptors: *Patents, *Waste water treatment, *Domestic wastes, Aeration, Suspended solids, Chemical reactions, Oxidation, Equipment.

A selfcontained apparatus for on-site renovation of sanitary waters is comprised of three aeration chambers. They are: a mineral storage and dispensing container, a submerged suspended solids separator located in the third aeration chamber, a flow equalizer, a chemical oxidizing agent dispensing system, a chemical oxidation-clarification chamber and a charcoal containing chamber, all enclosed in a single tank designed for use on land as a single or multiple family waste water renovation system, or off-shore as a marine sanitation device. METHOD AND APPARATUS FOR THE ENHANCED TREATMENT OF FOOD PROCESSING WASTE WATERS USING AEROBIC MICROORGANISMS,
D. A. Rollag, J. N. Dornbush, and R. C. Renner.
U.S. Patent No 4,201,663, 5 p, 2 Fig, 18 Ref; Official Gazette of the United States Patent Office, Vol 994, No 1, p 248, May 6, 1980.

Descriptors: *Patents, *Waste water treatment, *Organic wastes, *Food processing industry, Odor, Gases, Aerobic bacteria, Absorption, Adsorption, Biodegradation, Microorganisms.

The severe odor problem which is inherent in the anaerobic lagoon treatment method to purify the waste waters from meat, poultry, and other food processing plants, greatly limits the possible locations for treatment sites and creates a severe environmental problem. Accordingly a general object of this invention is to provide an improved method and apparatus for aerobic bacterial decomposition of odorous gases generated by the anaerobic bacteriological decomposition of organic liquids to thereby minimize the odor problem inherent in prior art anaerobic lagoon treatment processes. The process uses a plastic film to support an air transport system and a blanket of inexpensive biodegradable material which provides the functions of heat insulation, odor absorption/adsorption and mechanical support for attached aerobic microorganisms which act to decompose odorous gases. W81-01722

ULTRAFILTRATION OR REVERSE OSMOSIS TREATMENT OF EMULSIFIED OIL METAL WORKING COOLANTS,
Continental Group, Inc., New York. (Assignee).
I. M. Hekal.
U.S. Patent No 4,201,664, 5 p, 1 Fig, 9 Ref; Official Gazette of the United States Patent Office, Vol 994, No 1, p 249, May 6, 1980.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, Industrial wastes, Separation techniques, Reverse osmosis, Emulsions, Oil wastes, *Oily water, Ultrafiltration, Product recovery.

A portion of the oil-in- water emulsion used as a lubricant/coolant in the shaping of metal articles such as containers is subjected to a reverse osmosis or ultrafiltration process to concentrate the oil portion and separate a water permeate. The oil concentrate is reincorporated in the remaining portion of the coolant and the permeate is used as rinse water to remove oil residues retained on the article from the metal shaping operation. The coolant is then reconstituted with the oil residue rinsed from the article. By using permeate derived from the coolant for the rinsing and then reconstituting the coolant with the effluent collected from the permeate rinsing of the article, the oil normally lost with the disposal of rinse water is recovered and the water disposal problem associated with such effluent is substantially eliminated. The presence of surfactant in the permeate rinse water provides the additional advantage that the surfactant promotes the removal of the adhered oil from the metal article being rinsed. (Sinha-OEIS)
W81-01723

USE OF NONSTOICHIOMETRIC CARBON SULFUR COMPOUNDS TO REMOVE COMPONENTS FROM LIQUIDS,
Exxon Research and Engineering Co., Florham Park, NJ. (Assignee).

TREATING PULP-AND-PAPER MILL STREAMS,
Sprague Electric Co., North Adams, MA. (Assignee).
J. A. Newton.
U.S. Patent No 4,201,666, 3 p, 2 Tab, 11 Ref; Official Gazette of the United States Patent Office, Vol 994, No 1, p 249, May 6, 1980.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, *Pulp and paper industry, Chemical wastes, polyelectrolytes, Flocculation, Color, Sedimentation.

Aqueous pulp-and-paper mill waste streams are treated with a waste stream derived from the nitric acid etching of aluminum foil for electrolytic capacitors. This waste stream consists essentially of aqueous acidic aluminum nitrate, and a polyelectrolyte is added to it to synergistically improve flocculation, settling, and dosage rates. One of the purposes of this invention is the utilization of one waste stream to treat another waste stream, thereby simplifying the disposal of each and reducing chemical requirements. (Sinha-OEIS)
W81-01725

PROCESS FOR REMOVING ARSENIC FROM AQUEOUS MEDIUMS,
FMC Corp., Philadelphia, PA. (Assignee)
H. P. Liao.
U.S. Patent No 4,201,667, 7 p, 11 Tab, 4 Ref; Official Gazette of the United States Patent Office, Vol 994, No 1, p 249, May 6, 1980.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, Separation techniques, Chemical precipitation, *Arsenic compounds, Phosphorus, Hydrogen ion concentration.

An improved process for treating an aqueous, arsenic-containing medium provides for the rapid removal of the major portion of arsenic, and also minimizes residual arsenic which may normally be present as water-soluble compounds. The process comprises incorporating into an aqueous, arsenic containg medium, and in the presence of phosphorus, sufficient calcium hydroxide ($Ca(OH)_2$) to adjust the aqueous medium to a pH of from 7.0 to 11.5, thereby causing both the arsenic and phosphorus to precipitate, and thereafter separating the precipitates. Residual concentrations of arsenic and phosphorus, which are in lower oxidation states and thus are normally present as water-soluble compounds, are minimized by the oxidation with chlorine, preferably before the addition of the $Ca(OH)_2$, to more insoluble compounds which are separated as precipitates from the aqueous medium. (Sinha-OEIS)
W81-01726

PROCESS AND DEVICE FOR THE AERATION OF WASTE WATER,
Stamicarbon, B. V., Geleen (Netherlands). (A

ignee).
?. J. Fontein, and H. F. Jennekens.
J.S. Patent No 4,202,762, 10 p, 4 Fig, 2 Tab, 7 Ref; Official Gazette of the United States Patent Office, Vol 994, No 2, p 623, May 13, 1980.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, Biological treatment, Aeration, Activated sludge, Equipment, Jets, Circulation.

Waste water containing suspended biologically active sludge and circulating in an endless path in a vessel is aerated by withdrawing a stream of the water and recycling it to the vessel in the form of downwardly directed jets which penetrate the water surface and thereby entrain air in the water. The jets are directed onto the water surface at an angle of less than 60 degrees and the horizontal component of the motion of the jets is substantially parallel to the recirculation path of the main body of water at the point of impact. The jets are divided regularly over the water surface of the vessel. (Sinha-OEIS)
W81-01732

HIGH-EFFICIENT ACTIVATED SLUDGE METHOD,
Hitachi, Ltd. (Japan). (Assignee).
N. Shimizu, and Y. Odawara.
U.S. Patent No 4,202,763, 9 p, 5 Fig, 12 Ref; Official Gazette of the United States Patent Office, Vol 994, No 2, p 624, May 13, 1980.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, *Biological treatment, Aeration, Activated sludge, Oxygen.

Waste water containing organic materials is introduced into an aeration tank, and is subjected to aeration treatment in the presence of activated sludge, while supplying oxygen to the aeration tank. The organic materials contained in the waste water are oxidized by high-efficient activated sludge at a high oxygen transfer rate. (Sinha-OEIS)
W81-01733

PROCESS FOR REMOVING OIL PARTICLES FROM WASTE WATER CONTAINING THE SAME,
H. Ono, T. Saida, and K. Fukumura.
U.S. Patent No 4,202,766, 5 p, 5 Tab, 9 Ref; Official Gazette of the United States Patent Office, Vol 994, No 2, p 624-625, May 13, 1980.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, *Separation techniques, Oil wastes, Adsorption, Coagulation, Calcium hydroxide, Filtration.

The process of the invention comprises introducing into the waste water at least one compound selected from the group consisting of hydroxides and oxides of calcium for absorbing and/or coagulating the oil particles; introducing an acid into the waste water for dissolving the compound to permit the oil particles to be freed and/or converted into larger-size oil particles; and finally, separating the liberated oil from the waste water. The oil thus liberated is easily separated by permitting it to rise to the surface of the waste water by specific gravity difference. Upon separation, the oil particles having larger sizes can be removed almost directly. Smaller particles are removed by a filter having oleophilic synthetic resin fibers. (Sinha-OEIS)
W81-01734

PROCESS AND DEVICE FOR THE PURIFICATION OF WASTE WATER BY MEANS OF ELECTROFLOTATION,
Stamicarbon, B.V., Geleen (Netherlands). (Assignee).
M. Alfenaar.
U.S. Patent No 4,202,767, 4 p, 2 Tab, 2 Ref; Official Gazette of the United States Patent Office, Vol 994, No 2, p 625, May 13, 1980.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, *Separation techniques, Electrodes, Foam separtion, Suspended solids, Equipment, *Electroflotation.

A process for separating emulsified or suspended substances from waste water by electroflotation comprises passing that waste water through electrodes consisting of perforated material to produce a foam of gas and entrapped particles which were suspended or emulsified in the waste water and removing the foam. The diameter of the apertures of the material of the lower electrode is at most 5 millimeters and at least as large as is necessary to ensure proper passage of the liquid without hindrance to the upward movement of the gas bubbles through the liquid. (Sinha-OEIS)
W81-01735

APPARATUS FOR PURIFICATION OF WASTE WATER BY MEANS OF ACTIVE CARBON,
Berghau-Forschung G.m.b.H., Essen (Germany, F.R.). (Assignee).
G. Gappa, H. Juntgen, and J. Klein.
U.S. Patent No 4,202,770, 7 p, 2 Fig, 8 Ref; Official Gazette of the United States Patent Office, Vol 994, No 2, p 626, May 13, 1980.

Descriptors: *Patents, *Waste water treatment, *Water purification, Separation techniques, Activated carbon, Organic wastes, Adsorption, Flow control, Equipment.

An apparatus for purification of waste water includes an upright adsorber filled with active carbon passing in downward direction through the adsorber while waste water flows in an upward direction. A distributing arrangement at the region of the lower end of the adsorber, into which waste water is fed, is provided to assure a substantial even distribution of the waste water during its upward flow through the carbon column. Furthermore, a regulating arrangement is provided to regulate the flow of the carbon through the adsorber in dependence on the concentration of the organic contaminants adsorbed by the carbon. (Sinha-OEIS)
W81-01737

SUPERVISION AND CONTROL SYSTEM AT THE KANAGAWA WASTE WATER TREATMENT PLANT, YOKOHAMA,
Sewage Works Bureau, Yokohama (Japan).
Y. Hattori.
Journal of the Water Pollution Control Federation, Vol 52, No 5, p 931-937, May, 1980. 3 Fig, 2 Tab.

Descriptors: *Waste water treatment, *Automatic control, *Treatment facilities, *Computers, Data processing, Automation, Equipment, Quality control, Management, Personnel, Japan, *Yokohama(Japan).

The supervision and process control system at the Kanagawa waste water treatment plant (Yokohama, Japan) is a tier-distributed processing system equipped with a computer. The system was designed to enhance automation of the plant, reduce labor costs, provide a wide range of supervision, and improve quality control by the sensors, including the qualitative measuring instruments. The operation and control of the plant including two pumping relay stations are supervised and controlled by two operators during the night and on holidays. The centralized supervision system provides process values and the status of many different operations, as well as controlling local processes and the relay pumping stations. The quantitative and qualitative measurement and control system has duplicate instrumentation and mutual backups for vital measurements. Qualitative and quanitative measurements are displayed on the CRT and recorded on recording meters and automatically fed to a series of programs to produce daily and monthly reports. The system also does everything necessary for the plant to obtain stable operation; the choice of treatment mode can be changed to meet influent needs. The system is still under development. (Small-FRC)

KINETICS OF PHENOL DEGRADATION BY ACTIVATED SLUDGE IN A CONTINUOUS-STIRRED REACTOR,
Milan Univ. (Italy). Inst. of Physical Chemistry.
P. Beltrame, P. L. Beltrame, P. Carniti, and D. Pitea.
Journal of the Water Pollution Control Federation, Vol 52, No 1, p 126-133, January, 1980. 6 Fig, 3 Tab, 11 Ref.

Descriptors: *Activated sludge, *Phenols, Industrial wastes, Domestic wastes, *Waste water treatment, Mathematical studies, Water pollution treatment, Equations, Biodegradation, Biological treatment.

Three activated sludges, labeled A, B, and C, obtained from the industrial and domestic waste water treatment plant at Parabiago, Italy, were adapted to phenol as the sole carbon source. Kinetics of phenol degradation in a continuous stirred reactor were monitored by the 4-amino-antipyrine method. Kinetic runs were performed at 20 degrees C with sludges A, B, and C with a hydraulic retention time of 1.56 hours and with sludge C with a hydraulic retention time of 6.25 hours. Results showed that phenol was degraded by an adapted activated sludge with kinetics resembling those reported for other cases of mixed culture aerobic waste treatment. In the concentration range tested (up to 360 milligrams/liter in the influent), no substrate inhibition was evidenced, although the large saturation constant (245 milligrams/liter) suggested a greater difficulty in achieving low phenol levels than with other wastes. The rate of phenol removal by a sludge was affected to some extent by the type of sample initially used for preparing the adapted sludge. Influent phenol concentrations had a marked effect on the rate of phenol removal by a sludge. (Geiger-FRC)
W81-01786

CONTROL OF AEROBIC DIGESTION BY SUBSTRATE CONCENTRATION,
Toronto Univ. (Ontario). Dept. of Civil Engineering.
M. F. Hamoda, and J. Ganczarczyk.
Canadian Journal of Civil Engineering, Vol 7, No 3, p 456-465, September, 1980. 8 Fig, 4 Tab, 17 Ref.

Descriptors: *Activated sludge, *Aerobic treatment, *Suspended solids, Performance, Nitrification, Sludge digestion, Laboratory tests, Waste treatment.

Laboratory studies on aerobic digestion of activated sludge showed that an initial concentration of solids might be effective in reducing digester volume required for sludge stabilization and in lowering the associated rates of nitrification. The use of activated sludges of higher solids concentration in aerobic digesters may be a means of reducing the required digester volume. In the studied range of concentrations (to 3.5%), significant reductions of volatile suspended solids could be achieved with 10 to 15 days detention time at 20C, and a stable product sludge was obtained. Higher solids concentrations were associated with lower rates of nitrification. Thus, sludge solids concentration could be used to control nitrogen transformation during aerobic digestion of organic sludges. This could reduce sludge stabilization oxygen requirements. There are similar trends in batch digestion and semicontinuous digestion systems, but the method is not totally applicable to the design of continuous flow aerobic digesters. (Small-FRC)

COMPARISON OF CHLORINE DIOXIDE AND CHLORINE IN WASTE WATER DISINFECTION,
Stanford Univ., CA. Dept. of Civil Engineering.
E. M. Aieta, J. D. Berg, P. V. Roberts, and R. C. Cooper.
Journal of the Water Pollution Control Federation, Vol 52, No 4, p 810-822, April, 1980. 10 Fig, 7 Tab, 16 Ref.

Descriptors: *Chlorine, *Water purification, *Disinfection, Viricides, Water pollution control, Performance, *Waste water treatment, Bacteria, Ef-

fluents, Chlorine dioxide, Residuals, Coliforms, California, *Palo Alto(CA).

Chlorine and chlorine dioxide gave essentially equivalent coliform survival ratios when waste water treatment effectiveness was compared. Secondary effluent from a conventional activated-sludge process at Palo Alto Water Pollution Control Plant was used in the evaluations. The disinfectants were compared on a mass dose basis at a 30-minute contact time in non-nitrified secondary effluent. Chlorine dioxide was a more rapid agent, effecting greater bacterial inactivation than combined chlorine at the shorter contact times. On a residual basis, chlorine dioxide achieves the same survival ratio as chlorine, but with a lower residual concentration when chlorine exists as chloramines. The dose required to maintain a given residual in waste water is greater for chlorine dioxide. Chlorine dioxide was a more effective viricide than combined chlorine when investigated by measuring Poliovirus I survival in secondary effluent. (Small-FRC)

SOLIDS SEPARATION IN ACTIVATED SLUDGE SYSTEM DESIGN AND OPERATION,
A. W. Busch, and R. L. Irvine.
Journal of the Water Pollution Control Federation, Vol 52, No 4, p 804-809, April, 1980. 3 Fig, 1 Tab, 15 Ref.

Descriptors: *Suspended solids, *Activated sludge, *Design, *Sewage treatment, Filtration, Coagulation, Sedimentation, Technology, Performance, Standards, Water quality, Upgrading, Separation techniques.

The design and operation of five systems to reduce suspended solids in activated sludge systems are discussed. This improved treatment level will be necessary to reach the goal of fishable and swimmable public waters by 1983. Case I is the modification of an existing system at the secondary treatment level only. The secondary clarifier must be operated properly, or the biological reactor must utilize organisms that have good settling characteristics. Case II is the modification of an existing system by add-on filtration. Case III is the modification of an existing system at the secondary level plus add-on filtration. Case IV is the modification of an existing system by add-on coagulation, sedimentation, and filtration. These three systems all add some further treatment. Case V is a new system design which optimizes biological removal of soluble substrates and chemical removal of suspended solids. The Garrett scheme for hydraulic control of biomass growth rate is shown to be cost effective in overall system assessment. To meet higher effluent quality requirements, adding on more treatment stages is shown to be not cost effective and may not even accomplish the objective. Case V may be the best answer. (Small-FRC)

CARBON ADSORPTION ENHANCEMENT WITH OZONE,
Culp/Wesner/Culp, Cameron Park, CA.
R. L. Culp, and S. P. Hansen.
Journal of the Water Pollution Control Federation, Vol 52, No 2, p 270-281, February, 1980. 8 Fig, 1 Ref.

Descriptors: *Activated carbon, *Chemical oxygen demand, *Ozone, *Organic loading, Cost analysis, Adsorption, Organic compounds, *Waste water treatment, Effluents, South Tahoe(CA), California, Chlorination, Bacteria, Waste treatment, Cost estimates, Pilot plants, Filtration.

Adding ozone (3 or 10 mg per liter) during activated carbon treatment of secondary effluent did not sufficiently enhance COD removal in pilot plant studies at South Tahoe, California, to warrant installation of a full-scale plant. Tests were continued until COD breakthrough occurred. The best test results showed an 80% increase in adsorptive capacity, but these high results were not duplicated in subsequent runs. Several characteristics of the system in this facility contributed to the negative results--chlorine residuals and low soluble COD in the effluent and low biological activity and normally aerobic conditions on the adsorption bed. Ozone-enhanced activated carbon adsorption has been used successfully in Europe and in Cleveland, where different conditions prevail. It is believed that several factors affect the results of ozone addition--nature of the organic material, amount of organic loading, presence or absence of aerobic conditions, species and growth of bacteria, and pretreatment of effluent. W81-01799

EFFECT OF PRECIPITATION AND EVAPOTRANSPIRATION OF A SEPTIC TANK-SAND FILTER DISPOSAL SYSTEM,
Ontario Ministry of the Environment, Toronto. Applied Sciences Section.
M. Brandes.
Journal of the Water Pollution Control Federation, Vol 52, No 1, p 59-75, January, 1980. 4 Fig, 8 Tab, 24 Ref.

Descriptors: *Septic tanks, *Precipitation(Atmospheric), *Evapotranspiration, Domestic wastes, Coliforms, Sands, Filters, Flow, Nitrogen, Phosphorus, *Waste water treatment, Performance, Soil disposal fields.

A field study investigated the year-long operation of a newly constructed large underdrained sand filter and determined the effect of atmospheric precipitation and evapotranspiration on the removal of chemical and bacterial contaminants by the sand filter medium. The waste water treatment system consisted of a two-compartment septic tank and a sand filter equipped with measuring devices for monitoring waste water flow and periodically collecting samples. The average precipitation rate for the year was 2.47 mm/d, and the average evapotranspiration rate was 1.44 mm/d, or 58.3% of the precipitation. During the snow melt season, the outflow from the sand filter was about twice as high as the inflow; and during the summer months, the evapotranspiration rate exceeded the precipitation rate by 8.8%. The retention of phosphorus by the filter medium was 42.6%, and the removal of total nitrogen was 40.4%. The removal of total and fecal coliforms was almost 100%. Soil filters should be designed to enable a maximum possible runoff to reduce the infiltration of water from atmospheric precipitation. Higher sun exposure and evapotranspiration are advantages of soil filter operation. (Small-FRC)
W81-01800

EFFECTS OF COAL SLURRY ON WASTE WATER BACTERIA AND BACTERIOPHAGE,
Science Applications Inc., Los Angeles, CA.
L. W. Margler, and M. B. Rogozen.
Journal of the Water Pollution Control Federation, Vol 52, No 1, p 53-58, January, 1980. 1 Fig, 3 Tab, 20 Ref.

Descriptors: *Coals, *Adsorption, *Bacteria, Waste water treatment, Laboratory tests, Bacteriophage, Coliforms, Slurries, Pipelines.

The possibility that waste water exposure to coal in a slurry pipeline would upgrade the microbiological quality of the waste water effluent was examined. Bacterial adsorption onto coal might be possible, and then the bacterial population would be removed from the water along with the coal at the end of the pipeline. Bacteria adsorbed onto finer coal particles that pass through centrifuges or filters would be removed during clarification of recovered slurry water. Also, coal contains numerous organic compounds and heavy metals that can be toxic to bacteria. Laboratory experiments indicated that coal slurry was only mildly toxic to coliform bacteria; there was a 70% reduction in coliforms, and the fecal streptococcal concentration remained virtually unchanged. However, 99.8% of the E. coli C-specific phage present in the waste water became noninfective in the coal slurry; thus, exposure to coal slurry may upgrade the waste water. Further study is needed to determine the effect of slurry on pathogenic enteric viruses. (Small-FRC)
W81-01801

INDICATOR BACTERIA AND SALMONELLA IN FOOD-PROCESSING AND DOMESTIC EFFLUENT,
Elainlaaketieteellinen Korkeakoulu, Helsinki (Finland).
J. Hirn.
Journal of the Water Pollution Control Federation, Vol 52, No 1, p 48-52, January, 1980. 1 Fig, 3 Tab, 21 Ref.

Descriptors: *Coliforms, *Salmonella, *Food processing industry, Municipal wastes, Public health, Performance, *Waste water treatment, Biological treatment, Poultry, Finland.

The composition and reduction of the fecal indicator bacteria and Salmonella flora was studied in a treatment system that received its principal effluent from a food processing plant using broiler chickens and also received waste water from a rural community. Effluent and waste water samples were collected at the Saarioinen-Sahalahti treatment plant, located 200 km north of Helsinki (Finland). The plant has a high rate biological filter and serves the Saarioinen food processing plant (broiler chickens) and the rural Sahalahti community. The number of fecal coliforms was higher in the waste water, while the numbers of fecal streptococci in the two waters were almost equal. Biological and chemical purification reduced fecal coliforms and fecal streptococci by over 99%. Salmonella were found in the waste water and plant effluent. Salmonella infantis was detected in the effluent when infected flocks of chickens entered the plant. The continuous bacteriological control of the effluent from this type of food plant by analyses of the fecal indicators and Salmonella is of great public health importance. (Small-FRC)

A METHOD FOR THE CALCULATION OF BIOLOGICAL FILM VOLUME IN A FLUIDIZED BED BIOLOGICAL REACTOR,
McMaster Univ., Hamilton (Ontario).
M. Tsezos, and A. Benedek.
Water Research, Vol 14, No 6, p 689-693, June, 1980. 2 Fig, 3 Tab, 5 Ref.

Descriptors: *Biological treatment, *Mathematical models, Films, Fluidized bed reactor, Columns, Particle size, Particle shape, Aerobic, Activated carbon, *Waste water treatment, Bacteria.

This paper derives the theoretical relationships governing bed height and biofilm volume in a fluidized bed and attempts to determine the validity of these relationships through a comparison of calculated and experimentally determined particle diameters. The fluidized bed bioreactor was constructed from 10.2 cm i.d. plexiglass, and the medium chosen for study was granular activated carbon. Sources of error that might affect the validity of the calculations were inlet flow distribution problems, inaccuracies of direct particle diameter measurement methods, and inaccuracies in assumed biofilm density values. The authors concluded that (1) the expanded bed height in a fluidized bioreactor can be theoretically connected to biofilm volume in the reactor, (2) the proposed correlation can be used to calculate the biofilm volumetric yield, and (3) some of the error associated with particles without biofilm can be eliminated through the use of shape factors. CALORIMETRIC STUDIES OF BIODEGRADATION PROCESSES IN BIOLOGICAL WASTE WATER TREATMENT,
Sherbrooke Univ. (Quebec).
J-L. Fortier, B. Reboul, P. Philip, M-A. Simard, and P. Picker.
Journal of the Water Pollution Control Federation, Vol 52, No 1, p 89-97, January, 1980. 7 Fig, 2 Tab, 11 Ref.

Descriptors: *Microcalorimetry, *Biodegradation, Analytical techniques, Monitoring, *Waste water treatment, Biological treatment, Biochemical oxygen demand, Chemical oxygen demand, Oxy-

genation, Cultures, Toxins, Kinetics, Sludge bacteria, Pilot plants.

Preliminary studies were carried out to test the use of a fast-response flow microcalorimeter for monitoring biodegradation processes in a waste water treatment plant. Calorimetric results were correlated with those from biochemical oxygen demand (BOD) and chemical oxygen demand (COD) studies. Calorimetric experiments consisted of those in which the effluent and culture were mixed inside the calorimetric cell and those in which mixing was performed outside. Adequate microwatt sensitivity for monitoring heat evolved during biodegradation was achieved. A heat output on the order of 24-500 microwatts could be determined from mixing a culture containing about 0.1% suspended solids with a biodegradable effluent (0.1% COD). Where the culture-effluent mixing could be carried out within the calorimetric flow cell, the time constant for the measurement was about 1 minute. When the mixing was done prior to injection in the flow cell, the overall time of the measurement increased to 2 minutes. In either method, important kinetic data may be obtained by monitoring the initial response of the culture to COD shock loads or inhibitors. Changes in heat flux determined by the present method were qualitatively correlated with results obtained from respirometric procedures, and the heat output is closely associated with the rates of the biodegradation reaction. EFFECTS OF WATER CONSERVATION ON SANITARY SEWERS AND WASTE WATER TREATMENT PLANTS,
Los Angeles County Sanitation Districts, CA.
J. T. DeZellar, and W. J. Maier.
Journal of the Water Pollution Control Federation, Vol 52, No 1, p 76-88, January, 1980. 7 Fig, 10 Tab, 11 Ref.

Descriptors: *Water conservation, *Waste water treatment, Water utilization, Sewerage, Water quality, Flow rates, Suspended solids, Biochemical oxygen demand, Environmental effects, Nitrogen, Sulfur Phosphates, Effluents, Costs.

The effects of reduced water usage due to conservation measures on waste water collection and treatment systems were examined in relation to waste water composition, performance of collection and treatment facilities, and quality characteristics of treated effluent water. Conventional design correlations were used to describe sewer performance characteristics, while treatment system performance was evaluated using a published computer program. Results were compared with field data recorded from several California waste water treatment plants during conditions of drought from 1975 to 1977. Conservation measures caused reduced flows, resulting in sediment accumulations in sewer lines and methane and hydrogen sulfide corrosion of pipes due to anaerobic decomposition. Generally, biochemical oxygen demand (BOD) and total suspended solids increased, while the effects of reduced water use on nitrogen, sulfur and phosphate levels were inconclusive. Increased detention times in all unit processes were also noted with lower flows. Septic conditions often occurred in primary sedimentation tanks. Although concentrations of most parameters were increased in the final effluent, effluent loads were usually decreased, resulting in reduced environmental impacts. Specific suggestions for future plant designs to meet the challenges imposed by water conservation measures are offered. (Geiger-FRC)
W81-01807

NUTRIENT REMOVAL IN SUSPENDED GROWTH SYSTEMS WITHOUT CHEMICAL ADDITION,
Dorr-Oliver Inc., Stamford, CT.
P. M. Sutton, B. E. Jank, and D. Vachon.
Journal of the Water Pollution Control Federation, Vol 52, No 1, p 98-109, January, 1980. 11 Fig, 3 Tab, 22 Ref.

Descriptors: *Pilot plants, *Nutrient removal, Sludge, Nitrification, Denitrification, Sludge bacteria, *Waste water treatment, Biological treatment, Phosphorus, Nitrogen, Chemical oxygen demand, Organic compounds, Aerobic conditions, Anaerobic conditions.

A pilot plant study was conducted at the Waste Water Technology Center, Ontario, to obtain quantitative data on effects of various factors on P removal in single sludge systems and to determine the effects of anoxic and anaerobic conditions on the growth rates of the nitrifiers. Data was also acquired on N removal in single-sludge systems where denitrification relied on the organics present in the waste water and/or an external carbon source. Over a period of 4 months, three parallel single-sludge systems (A, B, and C) were operated according to a predetermined experimental design. Systems A and C were designed to achieve nitrification, partial denitrification, and enhanced P uptake. System B was designed to achieve only nitrification and served as a control. Systems D and E were designed to study N removal and give additional information on P removal. Results of the pilot plant operations showed that anaerobic conditions of up to 4 hours had no observable detrimental effect on nitrification. High levels of P removal were achieved in single sludge systems without chemical additions. The quantity of P removed was dependent on the level of COD removed in the system. Exposing the biological population to alternating anaerobic-aerobic conditions did not enhance P uptake into the sludge. A high level of N removal was obtained in single sludge systems without the addition of an external carbon source. (Geiger-FRC)

FACULTATIVE WASTE STABILIZATION POND DESIGN,
Humboldt State Univ., Arcata, CA.
B. A. Finney, and E. J. Middlebrooks.
Journal of the Water Pollution Control Federation, Vol 52, No 1, p 134-147, January, 1980. 10 Fig, 13 Tab, 14 Ref.

Descriptors: *Model studies, *Design criteria, *Oxidation lagoons, Kinetics, *Waste water treatment, Federal government, State governments, Mathematical studies, Equations, Organic loading, Hydraulic design, Flow profiles, Stabilization.

Four intensive facultative lagoon performance studies sponsored by the EPA were carried out at Peterborough, New Hampshire; Kilmichael, Mississippi; Eudora, Kansas; and Corinne, Utah. Criteria for optimum stabilization pond design were evaluated using data collected from the four sites along with data on organic loading and hydraulic detention time, empirical design equations, and rational design equations. The three models proposed proved inadequate as designs for facultative waste stabilization ponds. Often federal discharge standards were violated while the pond satisfied state orgnic loading and hydraulic detention time design criteria. The predictions yielded by the three empirical design equations and the two kinetic design models were not substantiated by published pond performance data. While the two kinetic models differed in their basic assumptions on the hydraulic flow patterns, neither described the measured performance. It was recommended that future research on pond performance consider the effect of physical and climatic conditions on hydraulic residence time. (Geiger-FRC)

AN INVESTIGATION OF THE INITIAL DILUTION OF SEWAGE DISCHARGED THROUGH SUBMARINE DIFFUSERS,
Techniche Eliminazione Inquinamenti, Milan (Italy).
P-G. Vigliani, B. Sclavi, R. Olivotti, A. Visconti, and G-F. Tartaglia.
Progress in Water Technology, Vol 12, No 1, p 321-337, 1980. 12 Fig, 1 Tab.

Descriptors: *Waste dilution, *Outfall sewers, *Diffusion, Mathematical models, Sewage, Nozzles, Salinity, On-site investigations, Europe, Sewage effluents.

The behavior and dilution of the dispersion plume of a domestic sewage source were investigated under various conditions, and several mathematical models were evaluated. Dilution was determined by measuring the salinity and the concentration of silicates within the plume. These values, together with the physical properties (velocity, temperature, etc.) were compared with values obtained using mathematical models. The procedure was repeated under varying conditions, including different diameters and directions of the discharge nozzle. The Cederwall formula was found to be the most suitable for predicting a safe value of initial dilution of a horizontally discharged jet, while the Cooley and Harris formula were simple and fairly accurate. The Rawn, Bowerman, and Brooks diagram gave unacceptably high results. The Fischer and Brooks diagram was useful for predicting the plume profile when the jets were in parallel. (Small-FRC)

SYNTHESIS OF WASTE TREATMENT SYSTEMS BY IMPLICIT ENUMERATION,
Environmental Protection Agency, Cincinnati, OH.
L. A. Rossman.
Journal of the Water Pollution Control Federation, Vol 52, No 1, p 148-160, January, 1980. 2 Fig, 10 Tab, 21 Ref.

Descriptors: *Computer models, *Designs, *Waste treatment, Model studies, Equations, Mathematical studies, Waste water treatment, Sludge treatment, Kinetics, Cost analysis, Structural analysis, Operations research, Simulation analysis.

The synthesis of waste water treatment systems involves specifying both the unit processes and operations as well as the design of the individual units within the structure. Ideally, models should integrate the designs of waste water and sludge treatment subsystems, select structure and design from a finite number of discrete alternatives, handle multiple pollutants or waste stream parameters, use principles of mass balance and reaction kinetics in predicting performance, evaluate costs and other systems criteria, and use a computationally efficient solution method. A new computer aided design procedure for waste treatment developed by the EPA is described. The method uses an implicit enumeration approach to select the combination of units that will best meet a set of design criteria from a list of unit process alternatives with fixed design specifications. The effect of return sidestream flows from sludge treatment units is approached by assigning representative penalty values to stream components which may be updated as new system designs are generated. Cost/energy-effectiveness analyses may be accomplished for design problems with over 15,000 alternate system configurations. The model presented is best applied in generating alternative system designs that emphasize different objectives to various degrees. (Geiger-FRC)

AUTOHEATED AEROBIC THERMOPHILIC DIGESTION WITH AERATION,
Cornell Univ., Ithaca, NY. Dept. of Agricultural Engineering.
W. J. Jewell, and R. M. Kabrick.
Journal of the Water Pollution Control Federation, Vol 52, No 3, p 512-523, March, 1980. 11 Fig, 2 Tab, 16 Ref.

Descriptors: *Aerobic treatment, *Aeration, *Heating, *Sludge treatment, Chemical oxygen demand, Biodegradation, Organic matter, Performance, Temperature, Equations.

A two-year project planned to demonstrate that a simple autoheated aerobic digestion process using full-scale equipment could be used to treat waste water sludge is presented. Mixtures of thickened waste, activated sludge and primary sludge were autoheated to temperatures in excess of 43C under all conditions for over a year. Self-aspirating aerators and well-insulated tanks in a full-scale reactor volume of 28.4 cu m were used; these had previ-

ously proven successful in treating animal wastes. Slurry temperatures exceeded 50C and reached a maximum of 63C. The reactors were easily started, and achieved temperatures in excess of 40C in about 10 days, even in cold weather. Maximum organic removal rates were obtained at loading rates between 8 and 10 kg of biodegradable COD/cu m - day. The equipment conserved heat of oxidation. An equation is given for calculating the potential for autoheating. The increase in temperature in degree C in the aerated slurry equals 2.4 times the COD in g/liter oxidized at hydraulic retention times less than 8 days. (Small-FRC)

DESIGN OF AN OVERLAND FLOW SYSTEM,
Brown and Caldwell, Walnut Creek, CA.
D. L. Tucker, and N. D. Vivado.
Journal of the Water Pollution Control Federation, Vol 52, No 3, p 559-567, March, 1980. 3 Fig, 1 Tab, 11 Ref.

Descriptors: *Septic tanks, *Overland flow, *Oxidation lagoons, Food processing industry, Industrial wastes, Agricultural watersheds, Biodegradation, Algae, *Waste water treatment, Design, Treatment facilities.

A design to upgrade the Newman Waste Water Treatment plant (California) is reviewed, with emphasis on the overland flow terrace system which is planned to remove algae from the oxidation pond effluent. Newman is an agricultural center with two milk processing and three vegetable packing plants. The facility includes septic tanks, followed by biological treatment in oxidation ponds. Increased industrial loadings in 1975 overloaded the system and caused several fish kills in the San Joaquin River. In the new system, septic tank effluent which currently flows in a ditch will be piped to an oxidation pond recirculation channel, where it will be mixed with recirculated pond water before being distributed to an aeration pond. Water will flow from the 5-acre aeration pond to the 50-acre oxidation pond. Oxidation pond effluent will flow through an effluent structure containing a chlorination injection and sampling facility, and then through a 30-minute contact chlorine chamber. Effluent will then be pumped to the overland terraces. (Small-FRC)

TOTAL NITROGEN REMOVAL IN A MULTI-CHANNEL OXIDATION SYSTEM,
Rexnord Inc., Milwaukee, WI.
C. S. Applegate, B. Wilder, and J. R. DeShaw.
Journal of the Water Pollution Control Federation, Vol 52, No 3, p 568-577, March, 1980. 4 Fig, 8 Tab, 14 Ref.

Descriptors: *Nitrogen, *Activated sludge, *Oxidation lagoons, Aeration, *Nitrogen removal, Oxygenation, *Waste water treatment, Nitrification, Ammonia, Organic matter, Treatment facilities, Performance.

An oxidation ditch/activated sludge plant was investigated to obtain baseline information on normal plant performance. Total nitrogen removal, up to 91%, was demonstrated by an endogenous nitrate respiration system. Very stable organic and nitrogen removals were obtained with no special operator attention. Plant effectiveness was due to several plant features, including multiple aeration channels in series. These allowed oxygen concentration control in each channel, permitting favorable conditions for the removal of carbonaceous material, ammonia oxidation, and nitrate reduction. Nitrogen removal was enhanced by splitting the feed to the first two aeration channels. Rotating disk aerators provided adequate channel mixing. Oxygen input was easily controlled by changing the number of disks or controlling disk submergence. Complete nitrogen removal allowed partial recovery of alkalinity and oxygen used for nitrification. Also, sludge flotation in the final clarifier was avoided. (Small-FRC)

REMOVAL OF ORGANIC SUBSTANCES BY BIOLOGICALLY ACTIVATED CARBON IN A FLUIDIZED-BED REACTOR,
McMaster Univ., Hamilton (Ontario). Dept. of Chemical Engineering.
M. Tsezos, and A. Benedek.
Journal of the Water Pollution Control Federation, Vol 52, No 3, p 578-586, March, 1980. 10 Fig, 4 Tab, 11 Ref.

Descriptors: *Adsorption, *Activated carbon, *Organic compounds, Performance, Sludge treatment, Waste treatment, Dissolved oxygen, Fluidized-bed reactor, *Waste water treatment.

Adsorbents which show promise for removing nondegradable organic substances generated during the treatment process were investigated. Batch adsorption isotherm tests on a bioresidual solution were used to evaluate F-1 activated alumina, XAD-4, XAD-7, XAD-8, Filtrasorb 400 activated carbon, Special A activated carbon, WRL 200 A anionic resin, and IRA 458 anionic resin. Continuous runs were performed in the fluidized-bed reactor system. All of the adsorbents except Filtrasorb 400 adsorbed only a fraction of the residual organics and indicated very low adsorptive capacities. Filtrasorb 400 adsorbed all of the biologically generated residual organics, and its maximum adsorptive power was more than 20 times higher than that of the other adsorbents tested. The volumetric yield of biofilm in an aerobic fluidized bed falls in the range of 0.8 to 2.9 cu cm/g total organic carbon oxidized. Inlet dissolved oxygen concentration had a strong positive effect on this yield. The level of inlet dissolved oxygen just sufficient for preventing anaerobiosis is recommended as a design optimum for fluidized bed bioreactors. (Small-FRC)

SCALEUP IN ROTATING BIOLOGICAL CONTACTOR DESIGN,
International Environmental Consultants Ltd., Toronto (Ontario).
R. W. Wilson, K. L. Murphy, and J. P. Stephenson.
Journal of the Water Pollution Control Federation, Vol 52, No 3, p 610-621, March, 1980. 8 Fig, 2 Tab, 19 Ref.

Descriptors: *Pilot plants, *Treatment facilities, *Design standards, *Waste water treatment, Biochemical oxygen demand, Nitrification, Temperature, Flow, Performance, Rotating biological contactors, Upgrading, Municipal wastes.

A scaleup plan and general design guidelines are presented for a rotating biological contactor (RBC) for treating municipal waste water. A pilot plant facility consisted of a coarse screen, grit tank, two primary clarifiers, three rotating biological contactors, and one secondary clarifier. During the scaleup evaluation, a 0.5 m unit was operated in parallel with the 2.0 m unit. Organic carbon removal rate decreased with increasing disk diameters at a given loading and media tip speed. There was little difference in the ability of the two RBC's to nitrify the waste water. For BOD removal, a surface area scaleup factor of 25% should be applied when designing a full-scale RBC system using 0.5 m RBC data. No scaleup factor is required for combined BOD removal plus nitrification. As part of a generalized design procedure, sample loadings that were derived from test data from the 2.0 m pilot RBC are presented in a table. Factors considered in developing these loadings were: scaleup factor, temperature effects, and natural diel variations in waste water flow and strength. (Small-FRC)

CURRENT STATUS OF WATER RECLAMATION AT WINDHOEK,
National Inst. for Water Research, Pretoria (South Africa).
L. R. J. van Vuuren, A. J. Clayton, and D. C. van der Post.
Journal of the Water Pollution Control Federation, Vol 52, No 4, p 661-671, April, 1980. 8 Fig, 8 Tab, 2 Ref.

Descriptors: *Water reuse, *Effluents, *Costs, Lime, Ammonia, Activated carbon, Adsorption, *Treatment facilities, Potable water, Chlorination, South Africa, *Windhoek(South Africa).

The Windhoek water reclamation plant (WRP I) was designed for the reclamation of water from maturation ponds that serve as polishing stages for secondary effluent discharged by upstream conventional waste treatment facilities. The plant was originally opened in 1963; by 1973 modifications were needed to continue water reclamation. The plant was modified to include high-lime treatment, ammonia stripping, improved activated carbon adsorption capacity, and carbon regeneration. The utilization duration of the facility improved to 10 months/year. After modification, the chemical, biochemical, and microbiological quality was highly satisfactory. The cost of reclaimed water was approximately $0.32/cu m as compared with $0.21/cu m for other sources in the area. The cost was dependent on chlorination demand, with associated ammonia concentration in the feed water. Currently, additions to the facility are planned which will provide for biological denitrification and phosphate removal. (Small-FRC)

ON-SITE WASTE WATER TREATMENT ON PROBLEM SOILS,
Minnesota Pollution Control Agency, Roseville.
M. J. Hansel, and R. E. Machmeier.
Journal of the Water Pollution Control Federation, Vol 52, No 3, p 548-558, March, 1980. 7 Fig, 1 Tab, 34 Ref.

Descriptors: Regulation, *Septic tanks, *Domestic wastes, Percolation, Permeability, Soil water movement, Design, Treatment facilities, Trenches, *Soil types, Performance, Minnesota, *Waste water treatment, Soil properties.

The development of standards for on-site systems for both suitable and problem soils are discussed, and specific design criteria are presented for four problem soil conditions. The Minnesota Pollution Control Agency began developing standards for the design, location, construction, and maintenance of on-site systems in 1974. By 1977, when the standards went to formal public hearings, over 1000 residents knew the technical details of the standards. It is necessary to have 0.9 m of unsaturated soil for proper treatment of waste water. Drain-field trenches are effective for normal soil treatment systems. Problem soils require different approaches. Rapidly permeable soils may require a trench lined with less permeable soil to aid in the formation of a biological mat. Slowly permeable soils require a mound system, and the sides of the trench must be raked or scarified. For high groundwater table or bedrock, there are many systems that can be installed a little higher than usual, which will give satisfactory results. Also, the groundwater can be lowered artificially. The mound system, which locates treatment above the original ground in elevated fill, is the solution to many problem locations. (Small-FRC)

POWDERED VERSUS GRANULAR CARBON FOR OIL REFINERY WASTE WATER TREATMENT,
Amoco Oil Co., Naperville, IL.
C. G. Grieves, L. W. Crame, D. G. Venardos, and W-C. Ying.
Journal of the Water Pollution Control Federation, Vol 52, No 3, p 483-497, March, 1980. 14 Fig, 9 Tab, 15 Ref.

Descriptors: *Activated sludge, *Oil wastes, *Activated carbon, Performance, Particle size, Costs, *Waste water treatment, Industrial wastes.

Powdered activated carbon (PAC) addition to activated sludge for the treatment of oil refinery waste water was evaluated at Amoco's Texas City, Texas, plant; at the Wood River Refinery; and in bench tests. Variables investigated were: degree of pretreatment, sludge age, PAC characteristics, PAC dose, and level of PAC in activated sludge

mixed liquor. PAC-enhanced sludge systems were successfully operated for extended periods at very high sludge ages (100 days) when optimum pretreatment was used. Systems can produce effluents with quality comparable to that of tertiary treatment by granular carbon adsorption. The PAC system was generally more cost effective than granular carbon systems. If high-surface-area carbon were available commercially, cost effectiveness would be even higher. Several questions remained to be answered about the process. For example, effluent variability and removal of nonconventional and priority pollutants from waste waters are topics which must be investigated. (Small-FRC)

WASTE WATER TREATMENT WORKS IN JAPAN: STATUS AND OUTLOOK,
Ministry of Construction, Tokyo (Japan). Sewage Works Div.
T. Tamaki.
Journal of the Water Pollution Control Federation, Vol 52, No 5, p 862-872, May, 1980. 3 Fig, 2 Tab.

Descriptors: *Sewerage, *Legislation, *Comprehensive planning, Treatment facilities, Construction, Standards, Water quality, *Japan, *Waste water treatment.

The history of sewerage in Japan, the current situation in waste water treatment, and the future are discussed. Waste water treatment was not a problem in Japan until recently because of widespread agricultural disposal and swift running rivers which emptied into the sea. Waste water treatment plants were required to comply with water quality standards with the passing of the Water Pollution Control Law in 1970. The most recent Sewerage Law required comprehensive basin-wide planning of sewerage systems, required the public to convert to sewerage within three years when it was available, and required effluent from factories and treatment plants to meet government standards. Five year sewerage construction plans are reviewed. Japan is studying control and treatment methods used in other countries and selecting and implementing those best suited for Japan's situation. ANAEROBIC TOXICITY EVALUATION BY BATCH AND SEMI-CONTINUOUS ASSAYS,
Stanford Univ., CA. Dept. of Civil Engineering.
D. C. Stuckey, W. F. Owen, P. L. McCarty, and G. F. Parkin.
Journal of the Water Pollution Control Federation, Vol 52, No 4, p 720-729, April, 1980. 7 Fig, 4 Tab, 10 Ref.

Descriptors: *Anaerobic digestion, *Toxins, *Bioassay, *Chlorides, *Sludge, Toxicity, Vinyl chloride, Methylene chloride, Ethylene dichloride, Vinyl acetate.

Both batch and semi-continuous feed bioassays were evaluated as methods to determine the toxic effects of four organic materials on anaerobic digestion. Biological assay procedures offer promise in determining the causes of digester failure. Semi-continuous bioassays were conducted using continuously stirred 1.5 liter digesters operated at a 15-day detention time and a temperature of 35 degrees C. Batch bioassays were conducted using flasks or bottles containing 30 ml of a nutrient and buffer solution, 20 ml of sludge from a laboratory digester, and 0.100 ml of ethanol to serve as a substrate. The toxic effects of methylene chloride (MC), vinyl chloride (VC), ethylene dichloride (EDC), and vinyl acetate (VA) were studied. Using batch assay, the toxicity thresholds were: less than 3.16 mg/liter for MC, between 200 and 400 mg/liter for VA, about 2.5 mg/liter for EDC, and between 5 and 10 mg/liter for VC. Using semi-continuous assay, the toxicity thresholds were: 1.8 mg/liter for MC, 1200 mg/liter for VA, 5-7 mg/liter for EDC, and more than 64 mg/liter for VC. Batch systems measured the toxicity threshold of a slug dose and thus usually gave a conservative figure. Advantages of this method were low cost, speed, and high reproducibility. Semi-continuous assays cost more, take more time, and are less reproducible, but give a better indication of inhibitory effects. (Small-FRC)

COST OF WATER RECLAMATION BY ADVANCED WASTE WATER TREATMENT,
Orange County Water District, Fountain Valley, CA.
D. G. Argo.
Journal of the Water Pollution Control Federation, Vol 52, No 4, p 750-759, April, 1980. 3 Fig, 11 Tab.

Descriptors: *Costs, *Water reuse, *Treatment facilities, Capital costs, *Waste water treatment, Reclaimed water, Water conservation, California, Operating costs, Maintenance costs, *Orange County Water District(CA).

Cost data are presented for the Orange County Water District's Water Factory 21, a facility which can act as a model for water reuse projects. The advanced waste water treatment processes used at Water Factory 21 include lime clarification with sludge recalcination, ammonia stripping, recarbonation, breakpoint chlorination, mixed-media filtration, activated carbon adsorption with carbon regeneration, reverse osmosis demineralization, and postchlorination. The capital cost is $60/1000 cu m, and the operation and maintenance cost is $84/1000 cu m. The capital cost of reverse osmosis is $45/1000 cu m, and the operation and maintenance cost is $118/1000 cu m. Thus, the total cost of the blended water produced by Water Factory 21 is $90/1000 cu m capital and $131/1000 cu m operation and maintenance. Research is being conducted currently to reduce these costs. At current prices, reclaimed water is cheaper than imported water in Southern California. (Small-FRC)
W81-01829

EFFECTS OF WATER CONSERVATION ON MUNICIPAL WASTE WATER TREATMENT FACILITIES,
Association of Bay Area Governments, Berkeley, CA.
J. A. Davis, and T. A. Bursztynsky.
Journal of the Water Pollution Control Federation, Vol 52, No 4, p 730-739, April, 1980. 2 Fig, 3 Tab, 5 Ref.

Descriptors: *Treatment facilities, *Water conservation, *Municipal wastes, Low flow, California, *Waste water treatment, Evaluation.

The extent of flow reduction to be expected after implementation of water conservation practices in the San Francisco Bay Area and the effects of the reduction on waste water treatment facilities were examined. While the volume of waste water will be reduced by low-flush toilets, low-flow shower heads, hot water pipe insulation, etc., the volume of pollutants in the waste water will not be reduced. Problems which may result from reduced flow are excess organic deposition in grit chambers, determination of new chemical doses required, and reduced hydraulic head-loss. Trickling filters, sewers, sedimentation basins, and activated sludge systems will not be affected adversely. The 10 to 20% expected reduction in flow will probably result in some extension in the length of time before facilities become overloaded. New facilities should cost less if the water conservation continues. The performance of biological reactors may have to be improved, but overall effects of the conservation problem will be minor. (Small-FRC)

SEPTIC SYSTEM PROBLEMS ON AN URBAN FRINGE,
New Castle County Areawide Waste Treatment, Newark, DE.
D. R. Goehring, and F. R. Carr.
Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers, Vol 106, No WR1, p 89-102, March, 1980. 3 Fig, 3 Tab.

Descriptors: *Septic tanks, *Domestic wastes, *Urbanization, Sewers, Planning, Waste water treatment, Water quality control, Costs, Groundwater, Suburban areas, Utilities, Delaware, *New Castle County(DE).

Water quality and public policy problems associated with the use of septic systems in New Castle County (Delaware) are discussed, and solutions to some of these problems are reviewed. Septic systems are needed in areas where public sewers would be prohibitively expensive. Land use and public policy decisions can make the high costs of treating waste water even higher. Conventional cost-effectiveness logic can not be applied to existing waste water treatment alternatives without considering the costs of groundwater pollution in determining future land use and waste water treatment needs. The beneficiaries of septic system use must bear the responsibility of correcting the problem, not the general public. When the costs to homeowners of installing public sewers are high, septic tank usage is encouraged. When setting public policy on septic systems, total water quality management goals must be considered. (Small-FRC)
W81-01836

TOXIC INHIBITION OF ANAEROBIC BIODEGRATION,
California Univ., Berkeley. Sanitary Engineering Research Lab.
F. Pearson, C. Shiun-Chung, and M. Gautier.
Journal of the Water Pollution Control Federation, Vol 52, No 3, p 472-482, March, 1980. 7 Fig, 1 Tab, 10 Ref.

Descriptors: *Anaerobic treatment, *Recreation wastes, *Toxins, Inhibitors, Tourism, Zinc, Phenols, Retardants, Rates, Recreational vehicle wastes, Rest room rates.

Waste water discharged at highway comfort stations and RV dump stations was characterized, and the degree of anaerobic biodegradation inhibition by toxins in RV waste was evaluated. RV black water, RV gray water, mixed RV black water and gray water, and rest room wastes were analyzed and evaluated for content of four toxicants: formaldehyde, zinc sulfate, phenol, and quaternary ammonium-based proprietary product. The effects of time and toxicant concentration under shock loading on anaerobic gasification rate were determined in laboratory tests. Half-kill doses were established for shock loading (acclimation loading) as follows: formaldehyde - 200 mg/liter, zinc sulfate - 400 mg Zn/liter, phenol - 500 mg/liter, and quaternary ammonium compound - 50 mg organic N/liter. At the concentrations of formaldehyde, zinc sulfate, and quaternary ammonium compounds in RV wastes caused by preservative chemicals added for odor control, the rate of anaerobic degradation may be on the order of one-third to one-half that for toxicant-free anaerobic biodegradation. RV black water typically contained 15,000 mg COD/liter and 7500 mg suspended solids/liter, while gray water and rest room wastes were marginally stronger than domestic waste water. (Small-FRC)

AN ENZYMATIC PRETREATMENT TO ENHANCE THE LIME PRECIPITABILITY OF PULP MILL EFFLUENTS,
Institute of Paper Chemistry, Appleton, WI.
R. L. Schmidt, and T. W. Joyce.
Tappi, Vol 63, No 12, p 63-67, December, 1980. 2 Fig, 4 Tab, 12 Ref.

Descriptors: *Pulp wastes, *Waste water treatment, *Enzymes, Horseradish peroxidase, Chemical precipitation, Pulp and paper industries, Organic wastes, Wood wastes, Catalysts, Polymers, Effluents, Industrial wastes.

Laboratory studies revealed that pretreatment of pulp mill effluents with the enzyme, horseradish peroxidase, polymerized low molecular weight color bodies. Subsequent lime precipitation improved color removal by a factor of 50% relative to conventional lime treatment. Molecular weight distributions of color bodies in effluent treated with horseradish peroxidase and hydrogen perox-

ide contained 8% more high molecular weight material than in the treatment with peroxidase alone. A test using inactive horseradish peroxidase versus active peroxidase, both with hydrogen peroxide, showed that although inactive proteins did slightly improve precipitability of color bodies by lime, it was the enzyme effect which accounted for a 30-34% improvement relative to controls. An excess of hydrogen peroxide had a degrading effect on the color bodies, but it had in limited amounts a polymerizing effect. (Cassar-FRC)

BACTERIA CAN SOLVE MALODOURS AND GREASE PROBLEMS IN TREATMENT PLANTS.
Water and Pollution Control, Vol 118, No 12, p 17, December, 1980.

Descriptors: *Bacteria, *Sewage treatment, *Organic wastes, Operation and maintenance, *Grease, *Odor control, Ponds, Activated sludge, Citizens utility, Maintenance, Treatment facilities, Waste treatment, Treatment, Algae.

A company which handles treatment of waste water for several Illinois communities uses a dried bacteria formulation to control odors and grease, for example in an activated sludge polishing pond. Planned addition of these facultative anaerobes maintains dominance of introduced species over the indigenous bacteria. Undesirable side effects, all of which are easily handled, include foaming in tanks, algae bloom, and duckweed accumulation. Maintenance costs are reduced because pumps and sewer lines require less cleaning and repairs. During closedowns and phaseouts of treatment facilities, odors are prevented by adding about 60 pounds of bacteria formulation. (Cassar-FRC)

THE EFFECT OF ALUMINIUM AND FERRIC IONS ON THE ELECTROPHORETIC MOBILITY OF PARTICLES IN TREATED PIGGERY EFFLUENTS,
University Coll. of Swansea (Wales). Dept. of Chemical Engineering.
S. T. Thuraisingham, J. A. Howell, and D. J. A. Williams.
Water Research, Vol 14, No 9, p 1209-1213, September, 1980. 4 Fig, 25 Ref.

Descriptors: *Waste water treatment, *Farm wastes, *Coagulation, Aluminum, Iron compounds, Electrical properties, *Electrophoresis, Colloids, Separation techniques, Pig breeding, Aging(Biological).

Electrokinetic properties are reported for pig slurry particles in the clarified effluent following aerobic treatment. Hydrolyzable cations such as aluminum and ferric ions caused charge reversal of the negatively charged colloidal particles in freshly aerated pig effluent. This in turn changed the isoelectric point (IEP) of these particles. When pig effluent had been left standing for more than 15-20 days, no charge reversal occurred at ferric chloride concentrations less than 0.001 and at concentrations of aluminum sulfate between 0.01 and 0.0001 M. Colloidal particles coagulate best in the vicinity of their IEP. By adding hydrolyzed cation at the appropriate pH, charge neutralization can be achieved. Thus it is possible to coagulate pig slurry particles in freshly aerated effluent over a controlled pH with small amounts of electrolytes. Pig effluent should be freshly aerated immediately prior to chemical treatment to enable the coagulation to occur with low dosages of the coagulants. (Baker-FRC)

A QUANTITATIVE INVESTIGATION OF THE REACTION OF OZONE WITH P-TOLUENESULFONIC ACID IN AQUEOUS SOLUTION AS A MODEL COMPOUND FOR ANIONIC DETERGENTS,
Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F. R.).
P. Joy, E. Gilbert, and S. H. Eberle.
Water Research, Vol 14, No 10, p 1509-1516, October, 1980. 10 Fig, 6 Tab, 14 Ref.

Descriptors: *Biodegradation, *Ozone, *Surfactants, Water treatment, Oxidation, p-Toluenesulfonic acid, Model studies, Chemistry, Organic compounds.

The reaction of p-toluenesulfonic acid (PTA) with ozone was studied at initial levels of pH 3 and 12 in aqueous solutions. The initial concentration of PTA was 1 mmol/l. The substrate elimination followed a zero order rate law. A 98% reduction in PTA required at least 7 mol ozone/mol PTA. To remove all the PTA the consumption of ozone increased to 16 mmol/mmol PTA. A 28% reduction in DOC and 74% reduction of COD resulted at this concentration of ozone. At higher ozone flow rates the PTA decomposition was quicker. However, the specific ozone consumption also increased. Methylglyoxal, acetic acid, formic acid, pyruvic acid, oxalic acid, sulfuric acid and hydrogen peroxide were identified as oxidation products. Mesoxalic acid was identified as a byproduct. Lactic acid was a further oxidation product at pH 12. A possible reaction mechanism is described, which suggests that ozone treatment can be used to enhance degradation of nonbiodegradable organics. (Baker-FRC)
W81-01853

THE INFLUENCE OF SLUDGE AGE ON HEAVY METAL REMOVAL IN THE ACTIVATED SLUDGE PROCESS,
Imperial Coll. of Science and Technology, London (England). Dept. of Public Health Engineering.
R. M. Sterritt, and J. N. Lester.
Water Research, Vol 15, No 1, p 59-65, January, 1981. 5 Fig, 1 Tab, 29 Ref.

Descriptors: *Heavy metals, *Activated sludge, Biochemical oxygen demand, Sludge, Trace elements, Metals, Suspended solids, Effluent, *Sewage treatment, Water pollution.

A laboratory simulation of the activated sludge process was conducted to determine the influence of sludge age on heavy metals removal. Ten metals were added continuously to 6 sludge samples with ages between 3 and 18 days. Results demonstrated differences in the behavior of heavy metals which may be attributable to various factors, including affinity for solids, soluble complexing agents, and chemical oxygen demand. The highest removal efficiencies for most metals occurred at the 15 day sludge age. Cobalt, manganese, and molybdenum removals were poor; chromium and cadmium removals were consistently highest, with efficiencies greater than 50%. (Titus-FRC)

THE INACTIVATION OF FAECAL COLIFORMS AND ASCARIS OVA IN FAECES BY LIME,
Asian Inst. of Tech., Bangkok (Thailand). Div. of Environmental Engineering.
C. Polprasert, and L. G. Valencia.
Water Research, Vol 15, No 1, p 31-36, 1981. 4 Fig, 2 Tab, 21 Ref.

Descriptors: *Sewage bacteria, *Worms, *Lime, Microorganisms, *Coliforms, *Water treatment, Calcium compounds, Sampling, Oxides, Hydrolysis, Chemical degradation, Fertilizer, Sludge, *Thailand.

The inactivating effect of lime on fecal microorganisms was investigated during a pilot project in Thailand. Human fecal samples were dosed with lime slurry and analyzed over a 48 hour period for pH, coliforms, and the presence of Ascaris ova. Results indicate that in sufficient quantities lime can be effective in inactivating coliforms. Insignificant effects are observed with a pH of 9. In all cases the contact time of 3 hours was sufficient. Results indicate ovicidal effects on Ascaris at a low efficiency. The application of lime as a disinfectant may be a useful, low-cost method of reducing disease in developing countries. (Titus-FRC)

BIOLOGICAL DENITRIFICATION IN AN UPFLOW SLUDGE BLANKET REACTOR,
Agricultural Univ., Wageningen (Netherlands).
K. Klapwijk, J. C. M. van der Hoeven, and G. Lettinga.
Water Research, Vol 15, No 1, p 1-6, January, 1981. 4 Fig, 4 Tab, 16 Ref.

Descriptors: *Sludge treatment, *Nitrates, *Dentrification, Solids contact processes, Flow, *Nutrient removal, Waste treatment, Activated sludge, Biodegradation, Sands, particle size, Velocity, Sewage effluents, Suspended solids.

Upflow sludge blanket reactors with no carrier medium can be used for nitrate removal. Studies using fusel oil surface loading of 2 meters/hectare produced sludge concentrations of 40 grams of total solids per liter. Higher loads are believed to be attainable. The minimum nitrate removal rate obtained was 500 grams per cubic meter per hectare. The sludge blanket reactor requires no effluent recycling. In addition, it reduces the escape of suspended solids and carrier particles because it fluidizes sludges at lower velocities than conventional sand bed reactors. (Titus-FRC)

A COMPARISON OF THE CHARACTERISTICS OF SOLUBLE ORGANIC NITROGEN IN UNTREATED AND ACTIVATED SLUDGE TREATED WASTE WATERS,
Drexel Univ., Philadelphia, PA. Dept. of Civil Engineering.
G. F. Parkin, and P. L. McCarty.
Water Research, Vol 15, No 1, p 139-149, January, 1981. 5 Fig, 5 Tab, 36 Ref.

Descriptors: *Waste water treatment, *Nitrogen compounds, *Activated sludge, Biological treatment, Organic compounds, Chemical oxygen demand, Hydrogen ion concentration, Adsorption, Activated carbon, Separation techniques, Cation exchange, Chromatography, Amino acids, Anion exchange.

The characteristics of soluble organic materials containing nitrogen (SON) in untreated waste waters and activated sludge effluents were studied using low microbial seed biodegradation evaluation, filtration chromatography for molecular weight distribution, activated carbon and ion exchange to determine removal, and analyses for free and combined amino acids. Activated sludge effluent SON was more refractory than untreated waste water SON. SON produced biologically during treatment had decay rates that were similar to those of SON in municipal activated sludge effluents and was 20-100% refractory. Less than 10% of the SON in municipal activated sludge effluent was made up of free or combined amino acids. About 15-30% were thought to be nucleic acid degradation products. Of the SON and soluble chemical oxygen demand (SCOD), 50-60% had apparent molecular weights (AMP) of less than 1800. Treated and untreated waste waters had similar AMP. The excess SON generated during activated sludge start-up contained considerably more SON with molecular weights greater than 1800. SON and SCOD were efficiently adsorbed from treated and untreated waste waters and from biologically produced organics by activated carbon. A significantly greater amount of SON was removed by cationic exchange from all waste waters tested at pH 2.0 than at pH 9.5. At pH 2.0, cationic exchange selectively removed more biologically produced SON relative to SCOD. (Geiger-FRC)

CONTROLLING AMMONIA IN WASTE WATER EFFLUENTS: A DISCUSSION,
Metropolitan Sanitary District, Chicago, IL.

W. L. Munch.
Public Works, Vol 111, No 6, p 140-142, June, 1980. 3 Ref.

Descriptors: *Ammonia, *Waste water treatment, Nitrification, Sludge treatment, Nitrogen compounds, Retention time, Evaluation.

This article makes reference to a previous publication dealing with the theoretical aspects of biological nitrification. The current author cites confusion arising out of the incorrect usage of the terms 'solids retention time' and 'solids wasting rate'. The current author states that wasting rates should not be kept as low as possible, but should be rationally determined based on a target solids retention time which reflects the various conditions of the system. Sludge wasting rates must be high enough to maintain MLSS concentration within the solids handling capacity of the clarifiers. The solids retention time should also be selected so that it is the lowest which will safely sustain nitrification under the most severe anticipated conditions. The author states that in order to control nitrification processes, especially single-stage ones, a full understanding of their requirements and potential problems is necessary. (Baker-FRC)

DRAINAGE BASIN CONTAMINATION PROMPTS REGIONAL PLANNING,
CH2M/HILL, Redding, CA.
S. A. Smith, and C. D. Gardner.
Public Works, Vol 111, No 5, p 76-77, 130, May, 1980. 2 Tab.

Descriptors: *Regional planning, *Water pollution control, *Earthquake engineering, *Treatment facilities, *Sewage treatment, Oroville, Thermalito, North Burbank(CA), California, Waste water treatment, Feather River(CA), Salmon, Fish, Municipal wastes, Construction costs, Sewage effluents.

Pollution problems in the Feather River, California, were solved after a sewage treatment plant was designed and built by the Sewerage Commission Oroville Region (SCOR), composed of 3 communities, Oroville, North Burbank, and Thermalito. Total construction costs were $7.4 million. Much of the existing facility at Oroville was incorporated into the new plant. The structure was designed to be earthquake resistant and has resisted quakes registering 7.5 and hundreds of aftershocks. The Feather River salmon population is protected from pollution by discharging treated effluent 5 miles below spawning grounds. Fingerling trout are used to monitor the toxicity of the effluent. An emergency storage pond with capacity for 2 days' flow is available for excess flows or emergencies. Operation and maintenance costs for the 1978-1979 fiscal year were $259,000, equal to 30 cents per thousand gallons. (Cassar-FRC)

EXPERIMENTAL LAND TREATMENT SYSTEM PROCESSES MINE DRAINAGE.
Public Works, Vol 111, No 2, p 91, February, 1980.

Descriptors: *Acid mine water, *Coal mine wastes, *Lime, *Waste water treatment, Water pollution sources, Acid streams, Water pollution, Mine drainage, Mine wastes, Filtration, Hydrogen ion concentration, Streams, Watersheds, Pennsylvania, Iron, Appalachian Mountain region.

In Appalachian Pennsylvania, where acid mine drainage has destroyed the biological activity of many streams, research is being conducted on a low cost system to treat acid mine drainage before returning it to the watershed. The Loyalhanna Watershed Association is using lime treated forest soil to remove dissolved iron and sulfuric acid from water flowing out of an abandoned coal mine which has been polluting Laurel Run, a tributary of Loyalhanna Creek. Lime treatment is performed in three earthen lagoons covering a half acre plot. The living filter principle is applied as limed soil treatment, wherein soil microorganisms act to cleanse the wastes before the water is returned to the main stream. Mixed results have been reported for the project so far. While level of iron in the mine drainage has been reduced, no significant decreases in pH values have been observed. To help decrease the pH of the mine drainage stream, less water will be released into the treatment lagoons, and the amount of lime used will be increased. (Geiger-FRC)

ENGINEERING EVALUATION OF NEW SLUDGE TREATMENT FACILITIES,
Japan Sewage Works Agency, Saitama. Research and Technology Development Div.
K. Ohmiya, and S. Takahashi.
Journal of the Water Pollution Control Federation, Vol 52, No 5, p 943-949, May, 1980. 4 Fig, 6 Tab.

Descriptors: *Sludge treatment, *Treatment facilities, Evaluation, Technology, Heating, Incineration, Dewatering, Sludge disposal, *Japan, Steam-heated screw press, Carver-Greenfield process.

New facilities and equipment related to sludge treatment that have recently been put on the market in Japan are evaluated. A steam-heated screw press has been installed at a dewatering plant. Conditioned sludge is dewatered and gradually compressed by a screw turning at 0.1 to 0.2 rev/min and further compressed by a compression ring. The steam heats the sludge to 40 to 70 degrees C, and quicklime is used as a coagulant. Various process parameters are given, and a disadvantage of the new system, odor of heated sludge, is explained. The Carver-Greenfield process, which uses triple-effect evaporators to dewater sludge and a boiler to incinerate dry sludge, is described. This process has lower operating and capital costs compared to conventional systems. A pilot-scale smelting furnace plant heated with an oil burner has been developed which is capable of processing sludge cake at a rate of about 800 kg/hour. Because the slag can be used as a filler like sand in sewer construction, this new method has gained attention. (Small-FRC)

SETTLING PROPERTIES OF EXTENDED AERATION SLUDGE,
Department of Health, Johannesburg (South Africa).
A. R. Pitman.
Journal of the Water Pollution Control Federation, Vol 52, No 3, p 524-536, March, 1980. 12 Fig, 5 Tab, 21 Ref.

Descriptors: *Sludge, *Settling velocity, *Suspended solids, *Activated sludge, Aeration, Dissolved oxygen, Nutrients, Nutrient removal.

The settling properties of activated sludges from two extended aeration plants and an activated sludge plant designed for biological nutrient removal were investigated. An apparatus was developed to measure settling properties using multiple batch settling tests. The relationship between sludge settling velocity and solids concentration followed a straight line on log-log graph paper. The results of this investigation can be used to optimize plant operation. Well-operated extended aeration activated sludge plants running at long sludge ages (15 to 20 days) can produce sludges with settling properties comparable to those of pure oxygen plants. Dissolved oxygen levels can not be allowed to drop to levels where filamentous growth is favored. Operation of a biological nutrient removal activated sludge plant risks the occurrence of slow-settling filamentous sludges, especially when the non-aerated zones make up a large proportion, more than 20%, of the main tank volume, and dissolved oxygen levels are suppressed. (Small-FRC)

ENERGY AUTONOMY IN THE WASTE WATER TREATMENT PROCESS,
Societe Degremont, Rueil-Malmaison (France).
J. Bernard, and P. DaVia.
Journal of the Water Pollution Control Federation, Vol 52, No 3, p 587-596, March, 1980. 6 Fig, 6 Tab.

Descriptors: *Energy, Conservation, *Treatment facilities, Anaerobic digestion, *Sludge disposal, Incineration, Costs.

Energy recovery in waste water treatment plants is discussed. Energy recovery is possible through anaerobic digestion of sludge and sludge incineration. Electromechanical recovery during anaerobic digestion can be achieved by means of intermediate internal combustion dual-fuel-type engines. While the output of the dual engines is relatively low, 30-40% of the energy spent can be recovered in the form of hot water from the cooling circuits and exhaust gas. The real output of energy transformation is actually about 50%. When fresh sludge is to be disposed of by incineration, the best energy recovery is obtained when the sludge is dewatered. Currently, energy recovery costs almost as much as buying energy. However, this may change as energy deficiencies grow. Also, an energy autonomous plant has the advantage of being independent of energy sources and may be located without regard to these sources. (Small-FRC)

SOLIDS HANDLING SYSTEMS FOR SIX DIFFERENT DISPOSAL OPTIONS,
Metropolitan Sanitary District of Greater Chicago, IL. Maintenance and Operations Dept.
R. R. Rimkus, E. W. Knight, and G. E. Sernel.
Journal of the Water Pollution Control Federation, Vol 52, No 4, p 740-749, April, 1980. 2 Fig, 7 Tab, 5 Ref.

Descriptors: *Sludge disposal, *Fertilizers, *Costs, Illinois, Cities, Drying, Land reclamation, Sludge digestion, Sewage sludge, Composting, *Solid waste disposal.

Six solids disposal management options practiced by the Metropolitan Sanitary District of Greater Chicago are reviewed. Nu Earth, a waste water solid that has been digested anaerobically and air dried for several years, is given away by the truckload. Nu Earth is compost-like material resembling rich soil and is acceptable for flower and landscape gardening. Heat-dried fertilizer, an excellent soil conditioner, is sold to a broker by competitive bid. Waste activated solids are conditioned with ferric chloride, dewatered by vacuum filters, mixed with dry solids, and heated to approximately 700C to produce the fertilizer. Some waste solids are digested in heated anaerobic digesters for 14 days and applied to land which was previously strip-mined. Other waste solids are aged in lagoons after heated digestion and then distributed free to the public or disposed of by a contractor. Since 1977, some solid wastes have been composted as part of a research program. Fertilizer production, land reclamation, and composting are the most costly of the six methods studied. (Small-FRC)

ALTERNATIVE FUELS FOR MULTIPLE-HEARTH FURNACES,
Brown and Caldwell, Walnut Creek, CA.
B. D. Bracken, and T. U. Lawson.

Journal of the Water Pollution Control Federation, Vol 52, No 4, p 791-803, April, 1980. 4 Fig, 9 Tab, 7 Ref.

Descriptors: *Energy, *Cost-benefit analysis, *Fuels, *Sludge treatment, Feasibility studies, Dewatering, Incineration, Alternative fuels, Energy conservation, Australia.

The reduction or elimination of fuel oil requirements for multiple hearth furnaces at the Lower Molonglo Water Quality Control Centre (Australian Capital Territory near Canberra) was investigated. The furnaces are used to effect sludge volume reduction and recover lime for reuse in the treatment process. It was technically feasible to fire refuse-derived fuel, waste paper, wood chips, or coal in the furnaces as a partial or total substitute for fuel oil (No. 2). Also, fuel oil consumption could be minimized by reducing sludge water content by either dewatering sludge in filter press or drying it with a rotary drier using furnace offgases. Either using a waste fuel or reducing sludge moisture will require modifications to the plant, and for some waste fuels, the construction of additional waste processing facilities would be necessary. The costs of the additional required facilities would offset any potential savings in fuel costs. A cost analysis indicated that none of the solid-fuel alternative schemes would be cost effective in comparison with the existing fuel-oil fired operation through 1989. A sludge drying operation would be cost effective by 1985 if afterburning was not required. (Small-FRC)

SINGLE-SLUDGE PURE-OXYGEN NITRIFICATION AND PHOSPHORUS REMOVAL,
Calocerinos and Spina, Syracuse, NY.
R. A. Clarkson, P. J. Lau, and D. J. Krichten.
Journal of the Water Pollution Control Federation, Vol 52, No 4, p 770-779, April, 1980. 6 Fig, 7 Tab, 6 Ref.

Descriptors: *Nitrification, *Sludge treatment, *Phosphorus removal, Performance, Biochemical oxygen demand, Lime, Ferric chloride, Alum polishing.

A pilot-plant program to obtain design criteria for single-sludge, pure-oxygen nitrification and compatible methods of oxygen removal is reviewed. The Morgan Road pilot plant study (Morgan Road Treatment Plant in Onondaga County, New York) had two phases. Phase I investigated FeCl2 and lime addition to primary and oxygen activated sludge nitrification. Phase II investigated oxygen activated sludge nitrification and alum polishing. Total system performance was 95% or greater for the removal of BOD5, NH3-N, and total suspended solids for all steady-state periods. Final effluent total phosphorus concentrations were maintained at less than 1.0 mg/liter over the same period. Over 90% of the BOD and NH3-N were removed by the nitrification system with a 2-hour influent detention time, at 20 and 13 degrees C, and after primary clarification with lime and ferric chloride. The nitrification system was successful in removing over 90% of the BOD and NH3-N with a 4-hour detention time at 13 degrees C when treating raw degritted waste water. Phosphorus was removed to less than 1 mg/liter by ferric chloride and lime addition before the primary clarifier. The lime was found to both buffer the nitrification system pH and remove phosphorus to an extent that minimized the dosage of ferric chloride required. (Small-FRC)

COMPOSTING AND DISPOSAL OF INDUSTRIAL WASTE WATER SLUDGE,
Alexander Potter Associates, New York.
P. A. Nese, J. Galandak, and J. A. Frederick.
Journal of the Water Pollution Control Federation, Vol 52, No 1, p 183-191, January, 1980. 1 Fig, 8 Tab, 1 Ref.

Descriptors: *Sludge treatment, *Biodegradation, *Soil disposal fields, *Sludge disposal, Industrial wastes, Heavy metals, Costs, Regulation, Performance.

A sludge management plan for the highly industrialized northern New Jersey area includes composting of the sludge and deposit on non-agricultural lands. As an alternative to the now illegal ocean dumping, sludge composting has the lowest capital and operating costs, and it satisfies the EPA requirement that beneficial use be given preference. However, the sludge includes heavy metals from industrial sources which make beneficial use difficult. For example, existing sludge contains 4332 mg/kg of zinc, while the NJDEP limit is 2500 mg/kg. An 18-day sampling program also found excessive levels of copper, nickel, cadmium, and chromium. Pyrolysis and land application were considered as alternatives to ocean dumping, but composting with the addition of wood chips to dilute the heavy metals was the most attractive alternative. A study is needed to see if the resulting composted product could be marketed, as similar compost is in several locations. The high heavy metal concentrations may eliminate this possibility. (Small-FRC)

DEVELOPING A COST-EFFECTIVE SLUDGE MANAGEMENT APPROACH,
Proctor-Davis-Ray, Inc., Lexington, KY.
C. R. Scroggin, D. A. Lewis, and P. B. Danheiser.
Public Works, Vol 111, No 6, p 87-91, June, 1980. 2 Fig, 3 Tab.

Descriptors: *Ultimate disposal, *Sludge disposal, *Composting, Fertilizers, Planning, Waste disposal, Municipal wastes, Incineration, Agriculture, Cost analysis, Feasibility studies, West Hickman Creek Waste Water Treatment Plant, Kentucky, Soil amendments.

An interim sludge management program was proposed after studying four alternatives for the West Hickman Creek Waste Water Treatment Plant, Kentucky. Continued land application of anaerobically digested sludge was recommended. Several capital expenditures suggested were a high flotation tire equipped applicator, belt filter press, and a bridge to provide truck access. It was recommended that liquid slude be applied as frequently as possible, with back-up storage facilities available for unfavorable weather. Careful attention to application rates and groundwater monitoring were mentioned. A cost-effective, long-range disposal plan includes gravity thickening of combined primary and waste activated sludge, anaerobic digestion with utilization of resulting methane gas, chemical conditioning with polymers, dewatering by continuous belt filter press, and composting for use as a soil conditioner. (Cassar-FRC)

CODISPOSAL OF REFUSE AND SLUDGE,
Cosulich (William F.) Associates, Woodbury, NY.
W. F. Cosulich.
Public Works, Vol 111, No 8, p 66-69, August, 1980. 7 Fig.

Descriptors: *Sludge disposal, *Incineration, Disposal, Coburning, Ultimate disposal, Cost estimates, Waste disposal, Municipal wastes.

Methods of coburning sewage sludge and municipal refuse are described. This process may be useful where other disposal systems are costly. The most successful method to date involves coburning unprepared refuse and dewatered sludge in a waterwall or refractory incinerator. Experiences at several European cities are detailed. Plans for U.S. installations using this method are being implemented in Harrisburg, Pa., and Glen Cove, N. Y. Another variation, which coburns refuse-derived fuel in a multiple hearth with limited air, has occasional problems with poor temperature control, hearth erosion, refractory failures, and air pollution. A process using refuse-derived fuel and sludge coburned in a fluidized bed incinerator experienced difficulties with economics and reliability. Unprepared refuse and sludge can also be burned in a modular starved air incinerator. Selection of an optimum method depends upon local costs for energy and sludge-refuse disposal. (Cassar-FRC)

ENGINEERING ANALYSIS OF THE COST/BENEFIT RELATIONSHIP FOR RURAL WATER SUPPLY TREATMENT SYSTEMS,
Missouri Univ.-Columbia. Dept. of Engineering.
G. D. Reed, T. Brown, and L. Dixson.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-173759, Price codes: A05 in paper copy, A01 in microfiche. Missouri Water Resources Research Center, University of Missouri Completion Report, October 17, 1980. 83 p. OWRT-A-118-MO(1), 14-34-0001-0127.

Descriptors: *Water treatment, *Cost-benefit ratio, *Rural areas, *Missouri, Optimization, Economics, Treatment facilities, Water districts, Water supply, Computer models.

Rural water supplies have experienced chronic water quality problems which often have been traced to basic management decisions which were made without cost/benefit information to provide viable alternatives. A program was developed based on recent cost data for a wide range of treatment and quality conditions. The program was written in a format which can be used by individuals who are not technically knowledgeable but responsible for management decisions. The program was written in basic so that the user could disect the solution at critical option points. With this information, the user can either obtain treatment estimates for several potential changes and continue working on those which are advantageous or acquire cost information for future budgeting purposes.

EXPERIENCES IN THE USE OF OZONE,
North West Water Authority (England). Eastern Div.
K. A. Sankey, and P. Whatmough.
Journal of the Institution of Water Engineers and Scientists, Vol 34, No 5, p 435-452, 1980. 2 Fig, 2 Tab, 15 Ref.

Descriptors: *Ozone, *Water treatment, *Reviews, Pilot plants, Disinfection, Economics, Water quality, Color, Operations research, Maintenance, Operating costs, Electric power costs, Equipment, Toxicity, Safety, Watchgate Plant(UK), *United Kingdom.

The performance, safety and economics of the Watchgate Treatment Plant, which uses ozone in the treatment of water from the Haweswater Reservoir, United Kingdom, are examined. No major problems of plant performance were encountered when pilot scale operations were converted to full scale ozone treatment processes. Ozone was used in a continuous process rather than intermittently to control color and disinfect water supplies. The equipment performance has been generally good. Electrical equipment, heat exchangers, refrigerators, ozonizers and vent gas absorbers all required minimal maintenance. Safety precautions must be executed when working with ozone due to its toxicity. Electrical energy constitutes the major cost of ozone plant operation, but all of the electrical requirements may be met from local sources. No special labor skills are needed to operate an ozone treatment facility other than those required in the usual large water treatment plant. Many of the corrosion problems associated with ozone may be alleviated with the use of polyvinyl chloride pipework. Carbon adsorption of vent gas has been useful in preventing corrosion of disposal ducts.

No problems with water quality have occurred at the Watchgate plant, which supplies 800 thousand people and many industries with strict water quality requirements. Proper operation of an ozonizer will take place only in a very dry atmosphere; therefore, dewpoint analyzers are essential to the Watchgate ozone treatment housing. Methods for monitoring ozone levels in gaseous or dissolved form are also discussed. (Geiger-FRC)

PROCESS AND APPARATUS FOR THE THOROUGH PURIFICATION OF WATER AND THE HIGHLY PURIFIED WATER OBTAINED THEREBY,
Institut Pasteur, Paris (France). (Assignee).
H. S. Marcovich, and R. D. Perrin.
U.S. Patent No 4,202,736, 7 p, 1 Fig, 2 Tab, 5 Ref; Official Gazette of the United States Patent Office, Vol 994, No 2, p 615-616, May 13, 1980.

Descriptors: *Patents, *Water treatment, *Water purification, *Water quality control, Heat, Evaporation, Condensation, Distillation, Equipment, Super heat, Apyrogenic water.

An object of the invention is to provide a process for obtaining water practically devoid of organic residues by a one-step process. In addition an object is to provide a process and apparatus enabling production of entirely reliable highly purified water which is suitable for the most exacting requirements of modern biology. The water is heated to convert it into steam; the steam is passed from a container into a superheating zone and then condensed in the form of purified water. The superheating zone contains at least in part, a packing of a material inert with respect to steam and impurities possibly present in the latter. The steam is superheated in this zone by means of supplementary heating to a temperature exceeding 300 degree C, and reaching notably from 400 degree to 700 degree C, preferably from 500 degree to 700 degree C. Highly purified apyrogenic water freed from undesired organic substances is produced by this process. (Sinha-OEIS)

REPORT ON WATER LOSSES,
E. C. Reed.
Aqua, No 8, p 0178-0191, 1980. 5 Fig, 7 Tab, 5 Append.

Descriptors: *Water loss, *Leakage, *Potable water, Water conveyance, Pipes, Conduits, *Water distribution(Applied), Public utilities.

Data on water losses from distribution systems were summarized from information received from 81 towns in 15 countries. Of total leakage from supply systems, an average of 64% is from water mains, 33% from service pipes and customer premises, and 3% from reservoirs. Cost of water, and not metering was a decisive factor in consumption and in existence of leakage control programs. Methods of leakage control and detection and the percentages of towns using these methods are as follows: response only to complaints or problems, 29%; regular leak sounding, 41%; district flowmeters, 4%; and waste metering, 26%. Most detection methods involve a listening device. The most frequent factors causing leaks were soil movement, pipe corrosion, heavy traffic, high pressure, and excavations. (Cassar-FRC)

POTENTIAL OF TUBE SETTLERS IN REMOVING RAW WATER TURBIDITY PRIOR TO COAGULATION,
Mosul Univ. (Iraq). Environmental Engineering Div.
S. Ahmad, and M. T. Wais.
Aqua, No 8, p 0166-0169, 1980. 6 Fig, 2 Tab, 14 Ref.

Descriptors: *Tube settlers, *Water treatment, *Turbidity, Coagulation, *Tigris River(Iraq), Settling velocity, Sedimentation rates, Suspended solids, Iraq.

A 2.6 cm tube settler removed as much as 85% of turbidity from raw Tigris River water at a flow rate of 4.1 cm per minute in a pilot study designed to test the effectiveness of tube settlers on removal of sand, silt, and clay in water prior to coagulation. Flow velocity was the most significant variable. Turbidity removal decreased with increasing flow velocity, with a sharp decrease in efficiency beyond 30 cm per minute. Tube diameter and its interaction with flow velocity was very significant. Optimum tube inclination was 40 degrees. Turbidity removal increased to 60%, remained constant until 80%, then decreased as the ratio of tube length to diameter increased. (Cassar-FRC)
W81-01775

CONTROLLING TASTE AND ODOUR LEVELS IN WATER,
A. J. Bowers.
Water and Pollution Control, Vol 118, No 12, p 14-16, December, 1980. 1 Tab, 3 Ref.

Descriptors: *Taste, *Odor control, *Potable water, Water purification, Water quality, Water pollution effects, Chlorination, Ozone, Activated carbon, *Water treatment.

Control of undesirable taste and odor problems in drinking water is attacked on two fronts--prevention of initial odor development and treatment to reduce odors present. A water source may be protected by reducing industrial discharge, improving the quality of sewage effluents, locating intakes where water quality is unaffected by weather conditions or contamination, using coagulation and flocculation prior to chlorination in the treatment plants, cleaning treatment plant equipment regularly, and maintaining the distribution system properly. If tastes and odors appear in finished water, possible alternatives to chlorination are chlorine dioxide and ozone. Activated carbon may be used to eliminate a large number of tastes and odors. A case study of a 3-day taste and odor problem in a sourthern Ontario municipality illustrates the cost of these problems: 2 million gallons of waste processed water, $1,000 for chemicals, and $6,000 for manpower. (Cassar-FRC)

WATER QUALITY IMPROVEMENT PROGRAM,
D. W. Fitzpatrick.
Public Works, Vol 111, No 5, p 74-75, May, 1980.

Descriptors: *Water quality control, *Polychlorinated biphenyls, *Trihalomethanes, Potable water, Municipal water, *Poughkeepsie(NY), New York, Corrosion, Lead, Water analysis, Chlorination, Activated carbon, Water purification.

The City of Poughkeepsie, N.Y., is pursuing plans to improve the quality of drinking water for its 65,000 customers. There are three major problems. The low level of polychlorinated biphenyls (PCB's) present in water and sediments of the raw source, the Hudson River, will be removed with a post-filtration carbon adsorption system if test results indicate this process will be beneficial. A $112,800 mid-point chlorine injection system is being installed to reduce the amount of trihalomethane formation. Work is being done on a caustic feed process to increase pH in the distribution system so that lead from older pipes will not dissolve into the water. Analytical equipment and personnel have been added to the facilities. A public relations brochure has been issued to increase the consumers' awareness of problems and solutions. It discusses the problems of PCB's, trihalomethanes, and corrosivity. (Cassar-FRC)

FINDING THE RIGHT RX FOR TASTES AND ODORS,
York Water Co., PA. Purification Dept.
D. R. Barnhart.
Public Works, Vol 111, No 6, p 95-96, 130, June, 1980. 1 Tab.

Descriptors: *Taste, *Odor, *Eutrophication, *Algicides, *Water quality, *Water treatment, Reservoirs, Pennsylvania, Water purification, Water pollution, Farm wastes, Activated carbon, Copper sulfate, Chlorination, Potassium permanganate, Nutrients.

Consumers of the York, Pa., Water Company, formed in 1816, experienced the first taste and odor problem in the memory of the system beginning in December, 1973. Algae were in full bloom in the ice-covered reservoirs. Neither activated carbon adsorption nor reducing raw water chlorination was effective in eliminating complaints. Increasing prechlorination residuals to 1-1.25 mg per liter finally reduced odor and taste to acceptable levels. When lake ice had melted, copper sulfate treatment was undertaken. Subsequent blooms were controlled with potassium permanganate until July 1975, when severe algae problems again developed. Odors experienced at various times were described as fishy, muskmelon, cucumber, grassy, earthy, and moldy. Although copper sulfate treatment improved the water quality in about 72 hours, blooms continued for 3 more years. Anabaena and Aphanizomenon had the greatest resistance to treatment. A sampling program and regular copper sulfate treatment have controlled problems since 1975. Possible causes of the elevated nutrient levels, which reach as high as 15 mg per liter, are rotting vegetation in Lake Redman (completed only 6 years before the initial problem) and heavy input of chicken manure into a tributary upstream during 1973. (Cassar-FRC)

HOW TO CONDUCT A GAC ORGANICS REMOVAL PILOT STUDY,
J. L. Fisher.
Public Works, Vol 111, No 6, p 100-102, June, 1980. 3 Fig.

Descriptors: *Activated carbon, *Adsorption, *Water purification, *Organic compounds, Design criteria, *Pilot plants, Water treatment, Water pollution treatment, Trihalomethanes.

Granular activated carbon systems for removing trace organic materials, such as trihalomethanes, from water supplies should be tested in pilot plant studies before designing a full-scale system. Laboratory-obtained adsorption isotherms are not completely applicable to full-scale rates of adsorption. A satisfactory pilot plant should be constructed of stainless steel, brass, teflon and/or glass to minimize organic contamination. Typically, 4 glass columns are used, 5 feet long and 4 inches in diameter, with pressure gauges and relief valves. Six inches of graded gravel is placed in the bottom of the column, and activated carbon in the remainder. The following parameters are monitored: temperature, pH, flow rate, suspended solids level, contaminant level, turbidity, and total organic carbon level. Although the column break-through curve is the most commonly used statistical tool, other methods may include carbon dosage rate curves, mass transfer zone determination, and adsorption capacity calculations. Design criteria obtainable from a field pilot study include effect of various contact times, optimum carbon bed depth, effect of hydraulic loading, number of vessels needed, type of activated carbon needed, carbon life/changeout frequency, carbon exhaustion rate, and contaminant loading rates. WATER-RESOURCES APPRAISAL OF THE SOUTH-ARKANSAS LIGNITE AREA,
Geological Survey, Little Rock, AR. Water Resources Div.
J. E. Terry, C. T. Bryant, A. H. Ludwig, and J. E. Reed.
Geological Survey Open-File Report 79-924, May, 1979. 162 p, 36 Fig, 50 Tab, 46 Ref, 1 Plate.

Descriptors: *Water resources, *Evaluation, *Water quality, *Lignite, *Arkansas, Groundwater, Surface waters, Water utilization, Available water, Strip mines, Water pollution sources, Coal mines, Chemical analysis, Data collections, *South Arkansas, *Baseline studies, Forecasting, Environmental effects.

The feasilbility of developing lignite resources in south-central Arkansas is an important question at the present time (1978). Part of the concern is related to the possible impacts that mining and processing of lignite will have on water resources. Not only will the disturbance caused by excavating affect the quantity and quality of surface and ground water, but the mining, processing, and conversion processes will require the use and consumption of significant quantities of water. To assess the magnitude of the effects of strip mining upon both surface and ground water, baseline conditions (hydrologic conditions in the area prior to mining) must be well defined. A thorough data file and literature search was made so that baseline conditions in the area could be defined. In addition, data-collection networks have been established for the collection of quantitative and qualitative information on streamflow and water levels in the aquifers. Data collected to date at these sites are included in the report. Collection of data at these sites will continue through at least September 1979. Information presented in this report can be used to estimate the quantities of water available for use and the possible effects of mining and associated dewatering on water resources. (USGS)

UNDERDRAIN FOR FILTER TANKS,
S. Kaufman.
U.S. Patent No 4,200,536, 4 p, 5 Fig, 8 Ref; Official Gazette of the United States Patent Office, Vol 993, No 5, p 1749, April 29, 1980.

Descriptors: *Patents, *Water treatment, *Water quality control, Filters, Filtration, Sands, *Backwashing, Sand filters.

Sand filters include filter beds of sand requiring frequent backwashing to free the beds from sludge or other material collected from the water. The backwashing operation is normally carried out by the introduction of clear water below the filter bed under sufficient pressure to thoroughly churn-up the sand and wash out the sludge. It has been found that underdrains currently used in sand filters fail to uniformly distribute the backwashed water. It is therefore an object of this invention to provide an underdrain for sand filters which effects a uniform distribution of backwash water through the filter bed. The underdrain assembly includes a central hub defining a chamber having sleeves radially extending and elongated hollow tubular elements extending outwardly of the sleeves. These elements have capped terminal ends, are of equal length, are spirally shaped and are equally spaced apart with their perforations being of equal size. Thus, the backwash water fed through the underdrain assembly is distributed uniformly through the filter bed. (Sinha-OEIS)
W81-01718

USE OF NONSTOICHIOMETRIC CARBON-SULFUR COMPOUNDS TO REMOVE COMPONENTS FROM LIQUIDS,
Exxon Research and Engineering Co., Florham Park, NJ. (Assignee).
D. W. Savage, C. H. Chang, and J. M. Longo.
U.S. Patent No 4,201,665, 19 p, 10 Fig, 8 Tab, 10 Ref; Official Gazette of the United States Patent Office, Vol 994, No 1, p 249, May 6, 1980.

Descriptors: *Patents, *Water treatment, *Separation techniques, Carbon, Sulfur, Adsorption, Waste water treatment, *Regeneration.

The invention relates to a process for removing organic and/or inorganic materials from aqueous and/or non-aqueous liquids by contact with nonstoichiometric carbon-sulfur compounds under adsorption conditions. Such compounds may be prepared by a variety of techniques including reacting a carbonaceous material at elevated temperatures with a sulfur-containing gas. Suitable carbonaceous materials from which C sub x S may be prepared include coal chars, conventional activated carbons, petroleum fluid coke, sucrose char, various polymeric chars and the like. The value of x is not critical and may range broadly. Spent C sub x S adsorbent may be regenerated thermally, by solvent extraction or by vapor stripping. (Sinha-OEIS)
W81-01724

DEPOSIT CONTROL THROUGH THE USE OF OLIGOMERIC PHOSPHONIC ACID DERIVATIVES,
Betz Lab., Inc., Trevose, PA. (Assignee).
L. W. Becker, P. S. Davis, and I. D. Morrison.
U.S. Patent No 4,201,669, 10 p, 10 Tab, 4 Ref; Official Gazette of the United States Patent Office, Vol 994, No 1, p 250, May 6, 1980.

Descriptors: *Patents, *Water treatment, *Cooling water, Industrial water, Boiler feed water, Water quality control, Scaling, Demineralization, Recirculated water.

The invention is directed to aqueous systems such as, but not limited to, cooling water systems, pulp and paper mill systems, boiler water systems and gas scrubber systems where the formation and/or deposition of materials contained in them can and would most likely cause problems because of decreased flow rates, lost energy efficiency, poor quality products or pollution considerations. The problems associated with scale formation and deposition, the deposition of iron compounds, etc. in industrial water systems are well known. This disclosure is directed to oligomeric phosphonic acid derivatives which possess excellent chlorine resistance and acceptable calcium tolerance and which, at substoichiometric amounts, inhibit the formation of scale in aqueous mediums. Additionally, the oligomers have been found to be quite active as dispersants for particulate matter contained in an aqueous medium. (Sinha-OEIS)

DETENTION BASIN SETTLEABILITY OF URBAN RUNOFF POLLUTION PHASE II,
Rutgers-The State Univ., New Brunswick, NJ. Water Resources Research Inst.
W. Whipple, Jr., and J. V. Hunter.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-170474, Price codes: A03 in paper copy, A01 in microfiche. Final Technical Completion Report, Dec., 1980. 29 p, 9 Fig, 16 Ref. OWRT-A-058-NJ(2), 14-34-0001-0132.

Descriptors: *Detention reservoirs, *Water pollution control, *Storm runoff, *Sediment control, Water pollution, Pollution, Heavy metals, Oil pollution, Organic wastes, Coliforms, Sediment, Storm water, Settling basins, *Storm water management, *Dual purpose detention basins, *Settleability of pollutants.

Because of the growing interest in stormwater management, and particularly of the possibility of using detention basins for removing particulate pollution, it is important to determine the effectiveness of such basins for removal of various polluting substances. In a first phase of the present study samples of urban runoff were allowed to settle in a large tube, and the quantity of each pollutant settling in a given time period determined. There was more variability in rate of settlement of specific pollutants than for total suspended solids. Lead and hydrocarbons settled out 60-65% in 32 hours, only slightly slower than total suspended solids. BOD and copper were removed at somewhat lower rates, and zinc even lower. These results confirm the effectiveness of retention of stormwater in removing particulate pollutants. In the second phase of the study two detention basins were modified by constructing outlets so as to provide prolonged retention of stormwater; and observed trap efficiency of various pollutants was compared to computed trap efficiency and to the results of laboratory settleability of the same pollutants. Results indicate that laboratory settleability may be a useful tool in estimating probable effectiveness of dual purpose detention basins for the retention. (See also W80-04807)(Whipple-Rutgers)

CHIRONOMID FARMING-A MEANS OF RECYCLING FARM MANURE AND POTENTIALLY REDUCING WATER POLLUTION IN HONG KONG,
Chinese Univ. of Hong Kong, Shatin. Dept. of Biology.
P-C. Shaw, and K-K. Mark.
Aquaculture, Vol 21, No 2, p 155-163, October, 1980. 3 Fig, 2 Tab, 14 Ref.

Descriptors: *Diptera, *Water pollution control, *Pollution abatement, Farm wastes, Fish food organisms, Larvae, Insects, Recycling, Waste treatment, On-site investigations, Economic efficiency, Fertilizers, Cultures, Agriculture, Hong Kong.

In Hong Kong, chironomid larvae grown on chicken manure are being used for fish food in fish cultures and as live food for aquarium fish. It has been estimated that an area of 13.5 ha is used continuously for chironomid farming, producing over 85% of the country's chironomid larvae and using up 0.6% of the annual load of chicken manure. The manure would otherwise have been discharged into farm streams, causing serious pollution problems in local rivers. Field studies on a chironomid farm were conducted from February to June, 1979. Results showed that an average of three crops of larvae per field, totaling 139.0 kg, would yield approximately $458.6 in gross income based on the normal US wholesale price of $3.30/kg of larvae. Successful growth of chironomid larvae on chicken manure-enriched water in pans in plastic greenhouses has also been reported. The chironomid larvae are easily managed and pose no danger to human health. More chicken manure is consumed by farming chironomids than by fertilizing for agricultural purposes. Other farm wastes such as pig and sheep manure have also been tested for the culturing of chironomid larvae. Development of chironomid farms is seen as an economical method to help alleviate the pollution of streams by farm wastes. (Geiger-FRC)
W81-01776

LIMING ACID LAKES IN SWEDEN,
National Board of Fisheries, Goeteborg (Sweden).
B. Bengtsson, W. Dickson, and P. Nyberg.
Ambio, Vol 9, No 1, p 34-36, 1980. 7 Fig, 4 Ref.

Descriptors: *Lime, *Lakes, *Acidic water, Water pollution, Neutralization, Air pollution, *Sweden, Rivers, Aquatic microorganisms, Fish, Salmon, Perch, Aquatic life, Zooplankton, Phytoplankton.

In 1976 the Swedish government initiated liming lakes and rivers to improve the quality of water polluted by acid rains. During 1977-1979, 700 lakes

and rivers were treated directly with a total of 120,000 tons of lime. A single application may be effective for 5 to 10 years. Ecological studies showed that liming acid waters greatly increased the populations of zooplankton, phytoplankton, and fish. However, pH often decreases during periods of high water flow, such as snow melt, due to stratification. The present budget for the liming project is $2.5 million, about one tenth of the actual need. Proposed funds for 1980 and 1981 are $5 million and $7.5 million, respectively. (Cassar-FRC)
W81-01814

DESIGNING FOR FORCE MAIN ODOR CONTROL,
Cahn, Inc., Wallingford, CT. Process Systems.
M. A. Vivona.
Public Works, Vol 111, No 7, p 74-76, July, 1980. 2 Fig, 3 Tab.

Descriptors: *Odor control, *Water quality control, *Aeration, Sulfides, Sulfates, Biochemical oxygen demand, Water properties, Design standards.

A typical problem encountered in the attempt to control odor by force main air injection is explored and a solution is offered. Air injection must be planned in dependence on the reaction rate, assuming oxygen uptake from the air supplied. Factors involved in calculating the injection parameters include temperature, enzyme lag, carbonaceous and nitrogenous biochemical oxygen demand, and sulfate and sulfide equilibria. The design of the system must act in general to inhibit odor formation. This is accomplished by shifting the metabolism of microorganisms present from anaerobic to aerobic. Upstream treatment in collection systems involved an oxidant for odorous compounds, and/or a source of oxygen to defer anaerobic metabolism. The amount and rate of aeration required in a force main for odor control is determined by the oxygen reaction rate and the detention period at minimum flow. An example is given which demonstrates the means of determination of compressor capacity, power and operating energy requirements. The capacity of the compressor required is related directly to the capacity of the pump. The typical air injection pressure is usually between 5 and 10 psi higher than the force main pressure at the point of injection. Most standard compressors are rated at 100 psig. At lower pressures more air can be delivered at reduced power. At high compressor capacities diurnally programmed air feed should be considered. (Baker-FRC)

HYDROLOGIC ANALYSIS OF THE PROPOSED BADGER-BEAVER CREEKS ARTIFICIAL RECHARGE PROJECT, MORGAN COUNTY, COLORADO,
Geological Survey, Lakewood, CO. Water Resources Div.
A. W. Burns.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-227887, Price codes: A05 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 80-46, July, 1980. 90 p, 44 Fig, 19 Tab, 30 Ref.

Descriptors: *Artificial recharge, *Project planning, *Model studies, *Hydrologic budget, *Colorado, Canals, Diversion, Water delivery, Ponds, Waterfowl, Flow augmentation, Surface-groundwater relationships, Aquifers, Water table, Water levels, Pumping, Available water, Hydrogeology, Projections, *Morgan County(CO), *South Platte River(CO), Badger Creek(CO), Beaver Creek(CO).

A hydrologic analysis of the proposed Badger-Beaver Creeks artificial-recharge project in Morgan County, Colo., was made with the aid of three digital computer models: A canal-distribution model, a ground-water flow model, and a stream-aquifer model. Statistical summaries of probable diversions from the South Platte River based on a 27-year period of historical flows indicate that an average-annual diversion of 96,000 acre-feet and a median-annual diversion of 43,000 acre-feet would be available. Diversions would sustain water in ponds for waterfowl habitat for an average of about five months per year, with a miximum pond surface area of about 300 acres with the median diversions and a maximum pond surface area of about 1,250 acres at least one-half of the years with the historic diversions. If the annual diversion were 43,000 acre-feet, recharge to the two alluvial aquifers would raise water levels sufficiently to create flowing streams in the channels of Beaver and Badger Creeks while allowing an increase in current ground-water pumping. The only area of significant waterlogging would be along the proposed delivery canal on the west edge of Badger Creek valley. If the total water available were diverted, the aquifer system could not transmit the water fast enough to the irrigation areas to avoid considerable waterlogging in the recharge areas. The impact of the proposed project on the South Platte River basin would be minimal once the ground-water system attained steady-state conditions, but that may take decades with a uniform diversion of the 43,000 acre-feet annually. (USGS)

ANALYSIS OF WATER RESOURCES PLANNING AND DECISION-MAKING PROCESSES AND OUTCOMES,
Policy Sciences Associates, Boulder, CO.
W. B. Lord, P. A. Bolton, J. A. Chase, and R. L. Cook.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-170482, Price codes: A05 in paper copy, A01 in microfiche. Research Report 81-1, prepared for Office of Water Research and Technology, January, 1981. 71 p, 4 Fig, 12 Tab, 10 Ref, 4 Append. OWRT-C-80081-P(No 8404)(1), 14-34-0001-8404.

Descriptors: Planning, Decision making, Institutions, *Programs, *Governmental interrelations, *Project planning, Water policy, *Feasibility studies, Priorities, Planning objectives, Planning purposes, Goals.

Federal water resources planning can be conducted in different ways and can produce different outcomes. The purpose of this research project was to investigate how different ways of doing planning might lead to different outcomes, and to reveal the preferences for those outcomes which characterize persons who have participated in water resources planning within different federal programs and in different roles. Information on the outcome preferences of recent participants in planning within five different federal programs was collected through the use of nominal group and judgement analysis techniques. Information concerning planning process variants and their potential association with outcome attainment was collected through literature reviews and the use of panels of experts. The sampled participants placed a lower priority upon attaining national goals than other possible planning outcomes. Solving local problems is the outcome with highest priority, while resolving conflicts and improving public understanding are assigned intermediate priorities. There are substantial differences in how planning should be conducted, depending upon the outcomes desired. Clear and specific federal mandates, the use of instrumental rationality or consensus building as planning modes, and the selection of participants in the planning process are key variables. Hypothetical process-outcome models are provided.

WATER RESOURCES PLANNING USING COMPUTER GRAPHICS,
Cornell Univ., Ithaca, NY. School of Civil and Environmental Engineering.
P. N. French, L. E. Johnson, D. P. Loucks, and D. P. Greenberg.
Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers, Vol 106, No WR1, p 21-42, March, 1980. 29 Fig, 4 Ref.

Descriptors: *Computer models, *Planning, Computer programs, Data processing, *Water resources development, Water management, Water quality control, Costs, Flood data, Flood forecasting, Graphical analysis.

Computer simulation and optimization models that are used to assist in multipurpose, multiobjective water resource planning often suffer from the lack of an efficient data input system and the lack of an easy yet comprehensive means of interpreting and communicating the results of model studies to others. These deficiencies may be minimized with the help of computer graphic input and display methods. Interactive computer graphics was applied to four planning problems, which included the prediction and management of water quality, multi-reservoir simulation for water supply, multiobjective analyses for reservoir sizing, cost and yields, and flood management. Tablet digitizing routines were frequently used to input spatial and other data, while the graphical output was accomplished by vector display methods. Visual feedback was obtained at all stages of the procedures. As the cost of computer memory declines, the use of the graphics input and display devices is expected to increase. (Geiger-FRC)

WATER USE, PROJECTED WATER REQUIREMENTS, AND RELATED DATA AND INFORMATION FOR THE STANDARD METROPOLITAN STATISTICAL AREAS IN TEXAS.
Texas Dept. of Water Resources, Austin Planning and Development Div.
Draft Report LP-141, August, 1980. 216 p, 30 Fig, 3 Tab, 2 Append, 1 Map.

Descriptors: *Texas, *Water resources planning, *Projections, *Water users, Comprehensive planning, Administration, City planning, Forecasting, Decision making, Management, Water allocation, Water management, Water resources development, Federal Water Pollution Control Act.

A presentation of current and projected water resources data and related information for each of the twenty-five Standard Metropolitan Statistical Areas (SMSAs) in Texas. Texas has fifteen major river basins and eight coastal basins which have approximately 3,700 designated streams and tributaries and more than 80,000 miles of streambed. Texans currently use about 17.5 million acre-feet of water per year, of which 12.2 million come from groundwater supplies. Most of the remaining surface water reserves are committed for foreseeable growth, and demands on the groundwater supplies are lowering water tables to the extent that major water supply problems are expected to occur in the foreseeable future. The SMSAs are depicted in relation to the river and coastal basins and are also cross-referenced on a map of the state to show the distribution of normal annual precipitation. A statewide perspective on water resources, their development and use, water quality planning and flood plain management is given. Each SMSA is analyzed in terms of present and future water use, planning, and management. The water supply outlook, problems, and possible solutions are discussed for the State as a whole and for each SMSA. (Garrison-Omniplan)

EMPIRICAL APPLICATION OF A MODEL FOR ESTIMATING THE RECREATION VALUE OF WATER IN RESERVOIRS COMPARED TO INSTREAM FLOW,
Colorado State Univ., Fort Collins. Dept. of Economics.
R. G. Walsh.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-170532, Price codes: A04 in paper copy, A01 in microfiche. Colorado Water Resources Research Institute, Colorado State University, Completion Report, December, 1980. 50 p, 7 Fig, 4 Tab, 65 Ref, 1 Append. OWRT-A-041-COLO(1), 14-34-0001-9006, 14-34-0001-0106.

Descriptors: *Water values, *Streamflow, *Reservoirs, *Recreation demand, Rivers, Evaluation, Economic feasibility, Cost analysis, Model studies, Value, Flow, Natural flow, Riverflow, Flow augmentation, Streamflow forecasting, River forecasting, Streams, Reservoir yield, Water supply, Reservoir sites, Reservoir operation, Reservoir yield, Recreation facilities, Recreation, Economics, Estimation, Colorado, *Rocky Mountain Region, Cold-water fishing.

Analysis was made of water value used for cold-water fishing at high mountain reservoirs/rivers located in the Colorado Rocky Mountains, which will contribute to an economic assessment of the tradeoff between providing recreational opportunities at high mountain reservoirs (HMR) and maintaining instream flow for river recreation use. Representative numbers (130) of fishermen were interviewed during the summer of 1978 at six sites (3 HMRs and 3 rivers), 6,000-10,000 feet in elevation. Willingness to pay was found to be contingent on changes in congestion and water level. Economic benefit functions were adjusted for crowinding, water level, access, participants' characteristics, and management costs. Providing access to 30% or 15% more HMRs would increase existing reservoir fishing benefits by an average of $3.27 or $1.25 per user-day, respectively, but once optimum capacity is reached, future expansion of fishing opportunities would be valued as average benefits of $10.26 and $11.78 per user-day on reservoirs and rivers respectively. Maximum benefits occur with an instream flow 35% of maximum flow. (Zielinski-IPA)

TREATED WATER DEMAND AND THE ECONOMICS OF REGIONALIZATION; VOLUME 2, ECONOMICS OF REGIONALIZATION: THE ELECTRIC POWER EXAMPLE,
Alabama Univ., University.
D. L. Hooks.
Environmental Protection Agency Report EPA-600/2-80-163, August, 1980. 60 p, 5 Fig, 5 Tab, 66 Ref, 1 Append. R805617.

Descriptors: *Utilities, *Economics, *Water supply, Electric power industry, *Water demand, Water distribution(Applied), Diseconomies of scale, Economic efficiency, Coordination, Planning.

One of the consequences of the Safe Drinking Water Act of 1974 has been an emphasis on the possible benefits of consolidating water suppliers into regional systems to offset some of the increased costs through scale economics and other gains in economic efficiency. Consolidation in the electric power supply industry is investigated as an example of a possible method for offsetting these new costs of water treatment. The structure of the power industry is examined along with the history, potential advantages, and costs and benefits of coordination. Alternatives to the present power system are also considered. The electric power industry has attained a high degree of interconnection and significant levels of coordination or consolidation on a regional basis, yet the extent of coordination and consolidation has not been as great as had earlier been predicted and advocated on grounds of economic efficiency. Evidence available indicates that few economic benefits have actually been realized from coordination. Some power systems or functions (distribution, for example) are larger than the optimum size. Only about 42% of the community water systems are privately owned, and they supply only 12% of the treated water in the United States. The greatest potential gains from consolidation may be among private systems and between publicly owned and private utilities. Alternative ways to capture the potential economies of regionalization may also be viable. These include pooling and coordination to the degree that the cost savings warrant, up to and including large systems under common ownership. (Moore-SRC)

DEVELOPMENT AND APPLICATION OF A WATER SUPPLY COST ANALYSIS SYSTEM; VOLUME I,
ACT Systems, Inc., Winter Park, FL.
J. I. Gillean, W. L. Britton, Jr., J. H. Brim, and R. M. Clark.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-152183, Price codes: A05 in paper copy, A01 in microfiche. Environmental Protection Agency Report EPA-600/2-80-012a, July, 1980. 80 p, 24 Fig, 2 Tab, 7 Ref, 2 Append. 68-03-2506.

Descriptors: *Cost analysis, *Utilities, *Water rates, *Data collections, Kentucky, Water costs, Water supply, Management, Water treatment, Water delivery, Operation and maintenance.

Although most utilities maintain an accounting system, the data provided by these systems are maintained in different formats and are therefore incompatible among utilities. Few systems provide continuous and adequate cost information directly. The Environmental Protection Agency initiated a research program to develop standardized techniques for analyzing costs witin a utility accounting framework. The system has been implemented successfully in Kenton County Water District No. 1 in Kentucky. Overall, the performance of the system has been impressive. In addition to providing useful management reports, the cost analysis system has assisted in improving the existing Kenton County Water District financial reporting system. The utility director has used the data to make key decisions regarding operations and for establishing billing rates to selected users, as well as for a general rate re-evaluation study. The system, using a matrix concept, can match operational and financial data at the top level functions of acquisition, treatment, delivery, and support services, and for two lower levels of detail. This system allows a water utility manager to evaluate the cost of the utility down to the smallest componet of the system. The costs are logically structured so one can move from one level to another with compatible data. The system can be used to estimate the cost of water as it flows through the actual utility system and is delivered to the various consumers. The reports generated by the system can be used to compare budgeted versus actual expenditures as well as a cost comparison between specific operations for different time periods. (Moore-SFR)

THE CONSTANT PERCENT RULE IN INTRA-SECTORAL WATER ALLOCATION,
Florida Univ., Gainesville. Dept. of Food and Resource Economics.
G. D. Lynne, and C. F. Kiker.
Economic Report 97, May, 1980. 16 p, 2 Fig, 1 Tab, 15 Ref.

Descriptors: *Florida, *Water allocation, *Cost allocation, Prices, *Water rates, Supply, Pricing, *Water distribution(Applied), Water allocation(Policy), Water demand, Economics, Water supply, Competing uses, Water consumption, Water policy, Commerical use.

Water management districts in Florida are charged with allocating water among competing users, including the commercial sector. Two water allocation rules are the 'constant percent rule' (CPR) and the 'economic efficiency rule' (EER). The study uses a 'best guess' total water demand curve relationship in addition to empirical estimates from an earlier study to show that CPR, which provides a uniform percentage reduction, does not provide equal benefit reductions. Under the EER rule, water is allocated among competing users during water-short periods to maximize economic efficiency. Total benefit losses from a required overall reduced use of 15% may be greater with the CPR, while implementing the EER through raising prices resulted in substantial reduction of benefit losses to three of the four groups considered—grocery stores, eating and drinking establishments, and hotels-motels, but not department stores. The hotel-motel group gained the most from the use of the EER in both a relative and an absolute sense. (Garrison-Omniplan)

6D. Water Demand

LAKE MICHIGAN WATER ALLOCATION IN ILLINOIS,
Illinois State Dept. of Transportation, Springfield. Div. of Water Resources.
F. L. Kudrna, D. R. Vonnahme, and K. L. Brewster.
Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers, Vol 106, No WR1, p 43-54, March, 1980. 1 Fig, 1 Tab, 5 Ref.

Descriptors: *Water allocation(Policy), *Water management(Applied), *Lake Michigan, Potential water supply, Water resources, Water conservation, Regulation, *Illinois, Equitable apportionment, Planning.

The process used by the Illinois water authorities to allocate Lake Michigan water to communities in northeastern Illinois to ensure that all communities will have adequate water for projected growth and development is described. Water allotment was developed from data collected in 1974 covering 6 counties and a population of 7,000,000 people. The principal factors considered were historical growth, new growth areas available through annexation, and land available for development within existing municipal boundaries. Per capita water consumption was also considered. Water demand for five steel mills was considered separately from municipal demand. Water resources available to the area were assessed, and the water allocation order was issued. A water conservation program is briefly described which includes placing brochures on water conservation in utility bills and providing schools with water conservation information. Systems management is also currently used to identify and properly use water resources. Continuous monitoring of water demand and use indicates that the allocation plan will meet Illinois' needs until 2010. (Small-FRC)

SLUDGE DEWATERING PLANT USES PROGRAMMABLE CONTROLLERS.
Public Works, Vol 111, No 2, p 82, February, 1980.

Descriptors: *Sludge, *Dewatering, *Centrifugation, Waste water treatment, Equipment, Sewage sludge, *Sludge treatment, Separation techniques, Control systems, *Los Angeles County, California.

The Los Angeles County's Carson sludge dewatering plant employs four huge centrifuges to meet new water quality standards. Each unit is fed wet sludge until a predetermined volume of dry solids is collected. A single programmable controller operates all four centrifuges, which saves on overall costs for the operation. When full the centrifuges are emptied with the inverters at low speed. When the centrifuges have decelerated to 50 rpm, a plow is introduced into the bowl of each to cut out the sludge cake which falls onto a conveyor a floor below. The cycle takes only about 20 minutes; however, more control problems are encountered than would occur in a continuous system. This is attributed to the static state of the system and the need for the controller to continuously monitor process conditions and initiate corrections. The controls are economical and flexible. They may be quickly programmed, and are not affected by dirt and wear, since they contain no moving parts. Numerous pilot studies were conducted with the control programs to make modifications and improvements before the equipment was installed. The efficiency and reliability of the process has enabled the programming to be routinely handled by plant engineers. (Geiger-FRC)

6E. Water Law and Institutions

AN INDUSTRY POINT OF VIEW,
British Columbia Packers, Ltd., Vancouver.
R. I. Nelson.
In: Pollution and the Fisheries: Proceedings, 27th Annual Meeting of the Fisheries Council of Canada, Environmental Protection Service, Report No EPS 3-WP-73-4, August 1973, p 28-35.

Descriptors: *Cost sharing, *Water pollution control, *Jurisdiction, *Industrial wastes, *Canada, Construction costs, Costs, Expenses, Legal aspects, Federal jurisdiction, Political aspects, Aquatic life, Water quality, Water quality control, Water quality standards, Water policy, Control, Pollution abatement, Industrial production, Cost analysis, Operating costs, Fisheries.

Adequate water quality is critical to fish survival. Certain pollutants, at levels below those affecting survival, can be concentrated in fish, making them unsuitable for eating. Thus, the fishing industry, although engaged in processing operations that produce wastes contributing to pollution, views pollution as a serious problem. Societal, political, and economic concerns exist. The recent 'scare' of mercury in certain fish species resulted in social concern for the quality of fish in general. Public presentation of balanced and realistic views provided by the government is needed. For pollution control, financial assistance should be provided. The Canadian Federal Government is spending more than one billion dollars for regional economic development programs, but the Department of the Environment has no funds for assistance to industry in controlling pollution problems. Without government assistance, the cost of pollution control systems by industry will cause sacrifice of modernization/expansion plans and failure of some businesses. Also, conflicts of jurisdiction occur for water uses: international, interprovincial or Federal-provincial. Examples have been noted. The International Joint Commission should assist resolution of Canadian-United States conflicts. (Zielinski-IPA)

STATE/EPA AGREEMENT, FY 81.
Washington State Dept. of Social and Health Services, Olympia.
September, 1980. 607 p, 10 Fig, 26 Tab, 18 Append.

Descriptors: *Washington, *Environmental engineering, Air environment, *Solid wastes, *Water quality standards, Waste disposal, Monitoring, Administration, Planning, Comprehensive planning, Natural resources.

Six environmental program issues plus an Executive Summary comprise the FY 81 agreement between the State of Washington and the U.S. Environmental Protection Agency. This document, which identifies commitments by each party to specific program priorities in FY 81, includes sections on Program Coordination, Water Quality Management, Solid and Hazardous Waste Management, the Washington State Drinking Water Program, Air Quality Management, and a Responsiveness Summary. Priority environmental problems listed include: Mt. St. Helens eruptions, which caused catastrophic local water system disruptions and continued air and water quality problems from ash fall; hazardous waste disposal, for which an acceptable site must be found and developed; energy facility sites, which must be identified and analyzed for environmental and socioeconomic impacts; municipal waste water, for which treatment plants must be upgraded; water quality problems in rivers, which include high bacterial counts, elevated temperatures, and high turbidity; air quality, in relation to areas in the state that have not achieved the national ambient air quality standards; and small public water systems, which have trouble maintaining water quality facilities. Program solutions are described for each of these priority problems, and methods for monitoring state and EPA commitments are defined. (Mantius-Omniplan)

WATER POLLUTION CONTROL IN JAPAN,
Water Resources Development Public Corp., Tokyo (Japan).
T. Hayashi.
Journal of the Water Pollution Control Federation, Vol 52, No 5, p 850-861, May, 1980. 1 Fig, 3 Tab.

Descriptors: *Legislation, *Standards, Water conservation, Administration, Water quality, *Water pollution control, Government, Toxins, *Japan.

The history of water quality legislation and administration in Japan, including current conservation and effluent control measures, is reviewed. The Water Quality Conservation Law was enacted in 1958 as an attempt to systematize water pollution control and establish effluent standards. The Factory Effluents Control Law of 1959 set penalties for industrial contamination. Increased environmental problems resulted in the passing of the Basic Law for Environmental Pollution Control in 1967, which established basic guidelines for determing the scope of environmental pollution, the responsibilities of those concerned, and the methods and measures for control. The Water Pollution Control Law of 1970 and the Seto Inland Sea Conservation Law of 1973 were even more specific. Water control standards set by administrators of water pollution programs are presented in a table. Water quality in Japan has improved in recent years, reflecting the vigorous enforcement of stronger control measures. The percentage of water quality samples that met the environmental water quality standards for nine toxic substances increased to 99.6% in 1977. Recent amendments to laws are reviewed. (Small-FRC)

CONFLICT BETWEEN ENERGY CONSERVATION AND WATER POLLUTION CONTROL STANDARDS,
North Carolina Univ. at Chapel Hill. Dept. of Environmental Sciences and Engineering.
J. C. Lamb, III.
Journal of the Water Pollution Control Federation, Vol 52, No 4, p 656-660, April, 1980.

Descriptors: *Energy, *Conservation, *Regulation, Legislation, *Water pollution control, Pollution abatement, Environmental effects, Water quality standards.

Environmentalists have insisted on careful evaluation of the environmental impacts of energy resource development, but now must consider the energy impact of environmental actions. Present water pollution regulatory programs require the installation of some waste water treatment plants that serve no justifiable function. All municipalities are required to install secondary treatment facilities, whether those communities produce oxygen consuming wastes or not. Furthermore, plants are required to operate continuously with no regard to waste flow. Finally, if the plant fails to meet standards, the owner is fined and required to make costly changes even if no environmental damage has been done. Blanket standards are wasteful. The approach should be modified to permit logical, scientifically correct, and environmentally necessary flexibility in administering pollution control standards. Goals can be accomplished without systematic waste. (Small-FRC)

POLICY ISSUES CONCERNING WATER QUALITY/QUANTITY,
Rutgers - The State Univ., New Brunswick, NJ. Water Resources Research Inst.
W. Whipple, Jr.
Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers, Vol 106, No WR1, p 71-79, March, 1980. 5 Ref.

Descriptors: *Water policy, *Cost-benefit analysis, Project planning, Governmental interrelation, Water quality standards, Water law, U.S. Water Resources Council, *Water management.

A coordinated approach of total water management is presented as a method which can achieve national water quality goals more efficiently than the Principles and Standards of the Water Resources Council. Lack of coordination between EPA, HUD, the Soil Conservation Service, and the Corps of Engineers, including differences in feasibility criteria and cost-sharing arrangements, results in a lack of effective water quality management. Policy alternatives to integrate water quantity and water quality planning are discussed. The most workable alternative is to decide on desired water quality goals and then apply cost-effectiveness criteria to all pollution sources, point and

nonpoint. Using this approach, it would not be necessary to determine economic benefits of water quality improvements, but only to determine which of the available approaches would reach the desired environmental goal at the lowest cost. (Small-FRC)

ALBERTA ENVIRONMENT MINISTER FORESEES MANY CHALLENGES FOR PROVINCE IN THE '80'S.
Water and Pollution Control, Vol 118, No 12, p 20-21, December, 1980.

Descriptors: *Alberta, *Water supply, *Sewage treatment, *Grants, *Financing, Waste water treatment, Calgary, Edmonton, Public utilities, Phosphorus compounds, Municipal water, Government finance, Water policy, Costs.

John W. Cookson, Alberta Minister of the Environment, described the functions of the Alberta Municipal Water Supply and Sewage Treatment Grant Program during the keynote address at the Western Canada Water and Sewage Annual Conference. Municipalities of all sizes are eligible for aid to either upgrade or replace present facilities or install new plants. The Edmonton Regional Utilities Study examined solutions to water supply and sewage disposal problems within the 13,800 square kilometer area surrounding the city, which is the site of current high population growth. Calgary's modern waste water treatment plant was mentioned as an example of pollution problems. A phosphorus removal grant program (total $18.1 million over 6 years) was established to help all communities install phosphorus removal facilities. The city will pay the first $20 per capita, and then receive 90% of capital costs from the Province. (Cassar-FRC)

7. RESOURCES DATA

7B. Data Acquisition

WATER LEVEL RECORDER,
Systron-Donner Corp., Concord, CA. (Assignee).
J. D. Gearheart, and F. W. Jenkinson.
U.S. Patent No 4,200,876, 7 p, 7 Fig, 6 Ref; Official Gazette of the United States Patent Office, Vol 993, No 5, p 1849, April 29, 1980.

Descriptors: *Patents, *Water level recorders, Instrumentation, Water levels, Water level fluctuations, Data transmission, Monitoring.

A water level recorder for use with pressure-sensitive chart paper has a framework with a lead screw rotatably mounted in the framework. A pulley is secured to the lead screw. The pulley is driven by a tape which is positioned by a float that is adapted to rest upon the surface of the water. A lead screw nut is mounted on the lead screw for movement longitudinally of the lead screw as it is rotated. A marking member is carried by the lead screw nut. A drum is secured to the lead screw for rotation with the lead screw. A helix for marking the chart paper is formed on the drum. Chart paper drive means are provided for advancing the chart paper over the helix and the marking member. Platen assemblies movable into and out of engagement with the chart paper are adapted to engage the chart paper to retain it so that two traces are formed on the chart paper as it is advanced, one by the marking member and one by the helix to give coarse and vernier indications respectively of the water level being measured. SATELLITES AS AID TO WATER RESOURCE MANAGERS,
National Environmental Satellite Service, Washington, DC.
D. F. McGinnis, Jr., R. A. Scofield, S. R. Schneider, and C. P. Berg.
Journal of the Water Resources Planning and Mangement Division, Proceedings of the American Society of Civil Engineers, Vol 106, No WR1, p 1-19, March, 1980. 14 Fig, 1 Tab, 14 Ref.

Descriptors: *Satellites(Artificial), *Data collections, *Water management, Water resources development, Monitoring, Snow managment, Ice jams, Ice breakup, Flood forecasting, Precipitation intensity, Remote sensing.

The application of satellite-gathered environmental data to certain water resource planning problems is considered. Data useful to the water resource management field that can be obtained via satellite pictures include area of snow cover, river ice breakup, flood extent maps, and precipitation estimates from convective systems. The National Oceanic and Atmospheric Administration (NOAA) currently operates the NOAA polar-orbiting system of satellites and the GOES system of geostationary satellites. The systems possess 1 km resolution visible sensors which are sufficient for monitoring various mesoscale and macroscale water resources. Snow surveillance was done by satellite on 30 river basins in the United States and Canada during the winter of 1977-78. Satellite pictures may also serve as daily monitoring systems to provide early warnings of ice jams along rivers. Convective rainfall is calculated by comparing the changes in two consecutive pictures, both IR and high-resolution visible. Some rainfall images as portrayed by satellite for parts of Missouri are given, along with satellite pictures of Hurricane Anita over Texas in September 1977. (Geiger-FRC)

A SIMPLE AND INEXPENSIVE 4-PI LIGHT COLLECTOR AND TWO DESIGNS FOR A LIGHT METER FOR LIGHT ATTENUATION STUDIES,
Southampton Univ. (England). Dept. of Oceanography.
P. J. leB. Williams, and N. W. Jenkinson.
Freshwater Biology, Vol 10, No 6, p 491-496, December, 1980. 4 Fig, 1 Plate, 8 Ref.

Descriptors: *Instrumentation, *Light penetration, Aquatic productivity, Phytoplankton, On-site tests, Water bodies, Light intensity, *Selenium photocells.

A simple, inexpensive device for measuring light attenuation in the field was constructed, using whole table tennis balls as the 4-pi spherical light collector. Two designs for simple meters to be used with selenium photocells are given--one based on an operational amplifier powered by two 9-volt dry cells and one a direct-reading log-ratio meter. The detector operates successfully down to a depth of 10 meters, and may be modified for deeper water use by filling the balls and detector head with a transparent oil. (Cassar-FRC)

7C. Evaluation, Processing and Publication

WATER RESOURCES OF THE COOK INLET BASIN, ALASKA,
Geological Survey, Anchorage, AK. Water Resources Div.
G. W. Freethey, and D. R. Scully.
Available from the Br. of Dist., USGS Box 25286, Fed. Ctr. Denver, CO 80225, Price: $6.00. Geological Survey Hydrologic Investigations Atlas HA-620, 1980. 14 Fig, 5 Tab, 33 Ref, 4 Sheets.

Descriptors: *Water resources, *Groundwater, *Surface-groundwater relationships, *Hydrogeology, *Alaska, Groundwater potential, Stratigraphy, Aquifers, Aquifer characteristics, Water yield, Geomorphology, Water resources development, Streamflow, Flow rates, Discharge(Water), Runoff, Regression analysis, Hydrologic data, *Cook Inlet(AK).

Ground-water and surface-water systems of Cook Inlet basin, Alaska, are analyzed. Geologic and topographic features that control the movement and regional availability of ground water are explained and illustrated. Five aquifer systems beneath the most populous areas are described. Estimates of ground-water yield were determined for the region by using ground-water data for the populated areas and by extrapolating known subsurface conditions and interpreting subsurface conditions from surficial features in the other areas. Area maps of generalized geology, Quaternary sediment thickness, and general availability of ground water are shown. Surface-water resources are summarized by describing how basin characteristics affect the discharge in streams. Seasonal trend of streamflow for three types of streams is described. Regression equations for 4 streamflow characteristics (annual, monthly minimum, and maximum discharge) were obtained by using gaging station streamflow characteristics and 10 basin characteristics. In the 24 regression equations presented, drainage area is the most significant basin characteristic, but 5 others are used. Maps of mean annual unit runoff and minimum unit yield for 7 consecutive days with a recurrence interval of 10 years are shown. Historic discharge data at gaging stations is tabulated and representative low-flow and flood-flow frequency curves are shown. (USGS)
W81-01671

COLUMBIA GLACIER, ALASKA: RECENT ICE LOSS AND ITS RELATIONSHIP TO SEASONAL TERMINAL EMBAYMENTS, THINNING, AND GLACIAL FLOW,
Geological Survey, Tacoma, WA. Water Resources Div.
W. G. Sikonia, and A. Post.
Available from the Br. of Dist., USGS Box 25286, Fed. Ctr. Denver, CO 80225, Price: $3.75. Geological Survey Hydrologic Investigations Atlas HA-619, 1980. 3 Sheets, 16 Fig, 13 Ref.

Descriptors: *Glaciers, *Hydrography, *Mapping, *Ablation, *Alaska, Bays, Ice, Icebergs, Calving, Movement, Ice-water interfaces, Discharge(Water), Aerial photography, Photogrammetry, Surveys, Hydrographs, Hydrologic data, *Columbia Glacier(AK), Glacier flow.

In 1974 the U.S. Geological Survey began an intensive investigation of the stability of Columbia Glacier, a calving tidewater galcier terminating in Columbia Bay, near Valdez, Alaska. Aerial photographs taken in 1957 and a sequence of photographs taken at about 2-month intervals since 1976, when analyzed photogrammetrically, provided detailed data on changes in Columbia Glacier's thickness, flow rate, and terminal position. Annual embayments in the glacier's terminus form during the summer-autumn season in most years; the size of embayments appears to be related to (1) the thickness of the glacier, and (2) the position and nature of subglacial freshwater discharge. Embayments have apparently increased in size in recent years; the largest embayments yet observed formed in 1975, 1976, 1977, and 1978. From April 1, 1977, to April 1, 1978, the total volume of ice calved was about 1.0 cubic kilometer. By January 1979 the glacier front had retreated from Heather Island. Glacier flow varies seasonally and synchronously in the lower 17 kilometers of the glacier; large accelerations occur near the terminus in response to embayment formation. Daily speed within 5 kilometers of the terminus increased from about 1.9 meters per day between 1963 and 1968 to about 2.7 meters per day between 1977 and 1978. In the lowest 15 kilometers, the glacier surface was lowered about 9 meters between 1957 and 1974, and about 13 meters between 1974 and 1978. Columbia Glacier is being reduced in mass due, in part, to recent losses caused by large embayments forming annually. If such reduction continues it will result in a drastic retreat. (USGS)
W81-01672

SUMMARY OF WATER-LEVEL AND DISCHARGE RECORDS FOR THE EAST EVERGLADES AREA, DADE COUNTY, FLORIDA,
Geological Survey, Tallahassee, FL. Water Resources Div.
J. J. Schneider.
Available from the OFSS, USGS Box 25425, Fed. Ctr. Denver CO 80225, Price: $5.00 in paper copy, $3.50 in microfiche. Geological Survey Open-File

Report 80-215, 1980. 33 p, 4 Fig.

Descriptors: *Data collections, *Surface waters, *Groundwater, *Florida, Sites, Water levels, Discharge(Water), Data storage and retrieval, *Dade County(FL), East Everglades area(FL).

Information concerning data collected and records maintained for 25 surface-water and 10 groundwater sites in the East Everglades area, Dade County, Fla., is presented. Listed are: location of sites, period of record, type of gage used, average discharge, and extremes for period of record. A history of records for each site includes the format of the data published and what data are stored in the U.S. Geological Survey computerized data system. (USGS)
W81-01673

WATER RESOURCES DATA FOR ALASKA, WATER YEAR 1979.
Geological Survey, Anchorage, AK. Water Resources Div.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-144818, Price codes: A16 in paper copy, A01 in microfiche. Geological Survey Water-Data Report AK-79-1, November, 1980. 365 p, 4 Fig.

Descriptors: *Alaska, *Hydrologic data, *Surface waters, *Groundwater, *Water quality, Gaging stations, Streamflow, Flow rates, Sediment transport, Water analysis, Water temperature, Chemical analysis, Lakes, Reservoirs, Water wells, Water levels, Data collections, Sites.

Water resources data for the 1979 water year for Alaska consist of records of stage, discharge, and water quality of streams; stage and water quality of lakes; and water levels and water quality in wells and springs. This report contains discharge records for 111 gaging stations, stage only records for 2 gaging stations, water quality for 58 stations, and water levels for 30 observation wells. Also included are 62 low-flow, 89 crest-stage, and 24 water-quality partial-record stations. Additional water data were collected at various sites, not part of the systematic data-collection program, and are published as miscellaneous measurements of discharge, lake stage, or water quality. These data represent that part of the National Water Data System operated by the U.S. Geological Survey and cooperating State and Federal agencies in Alaska. (USGS)
W81-01677

WATER RESOURCES DATA FOR ARKANSAS, WATER YEAR 1979.
Geological Survey, Little Rock, AR. Water Resources Div.
Geological Survey Water-Data Report AR-79-1, October, 1980. 633 p, 5 Fig, 3 Tab.

Descriptors: *Arkansas, *Hydrologic data, *Surface waters, *Groundwater, *Water quality, Gaging stations, Streamflow, Flow rates, Sediment transport, Water analysis, Water temperature, Chemical analysis, Lakes, Reservoirs, Water wells, Water levels, Data collections, Sites.

Water resources data for the 1979 water year for Arkansas consist of records of stage, discharge, and water quality of streams and wells; stage, contents, and water quality of lakes and reservoirs. This report contains discharge records for 66 gaging stations; stage only records for 1 gaging station; stage and contents for 4 lakes and reservoirs; water quality for 151 stations, 51 partial-record flow stations, 7 lakes, and 5 wells; and water levels for 83 observation wells. Also included are 125 crest-stage partial-record stations. Additional water data were collected at various sites, not part of the systematic data-collection program, and are published as miscellaneous measurements. These data represent that part of the National Water Data System operated by the U.S. Geological Survey and cooperating State and Federal agencies in Arkansas. (USGS)
W81-01678

WATER RESOURCES DATA FOR FLORIDA, WATER YEAR 1979--VOLUME 4. NORTHWEST FLORIDA.
Geological Survey, Tallahassee, FL. Water Resources Div.
Geological Survey Water-Data Report FL-79-4, September, 1980. 686 p, 48 Fig, 1 Tab, 9 Ref.

Descriptors: *Florida, *Hydrologic data, *Surface waters, *Groundwater, *Water quality, Gaging stations, Streamflow, Flow rates, Sediment transport, Water analysis, Water temperature, Chemical analysis, Lakes, Reservoirs, Water wells, Water levels, Data collections, Sites, *Northwest Florida.

Water resources data for the 1979 water year in northwest Florida consist of continuous or daily discharge for 69 streams, periodic discharge for 28 streams, peak discharge for 23 streams and continuous or daily stage for 4 streams; continuous elevations for 4 lakes and periodic elevations for 30 lakes; continuous ground water levels for 41 wells and periodic ground water levels for 353 wells; quality of water for 37 surface water sites and for 95 wells. These data represent the National Water Data System records collected by the U.S. Geological Survey and cooperating local, State and Federal agencies in Florida. (USGS)
W81-01679

A CASE STUDY OF COMPUTERIZED INDUSTRIAL WASTE DATA,
Metropolitan District Commission, Boston, MA. Sewerage Div.
N. D. Baratta, G. H. Bollier, and P. E. Schafer.
Public Works, Vol 111, No 9, p 105-107, September, 1980. 1 Fig.

Descriptors: *Data storage and retrieval, *Industrial wastes, Data processing, Computer programs, Waste treatment, Treatment, Standards, Management, Boston(MA).

A computerized data management system has been developed for the Metropolitan District Commission Sewerage Division, Boston, Massachusetts. This program may be used to prepare reports as required by EPA or other agencies, for example, summaries of toxic substances discharged, industry listings, and spill detection lists. The computer program may be applied to many requirements for industrial waste pretreatment as listed in CFR 40, Part 403. Report options on industries may be in several forms: alphabetical by category, log number, SIC number, pretreatment construction status, municipal summary sheet, constituent code, mass emission (pollutants), and permit renewal. Future options include lists of industries by flow rate, disposal method, type of pretreatment, and violations. (Cassar-FRC)

8. ENGINEERING WORKS

8A. Structures

SEWER CONSTRUCTION BY SHIELD METHOD IN YOKOHAMA,
Sewage Works Bureau, Yokohama (Japan).
S. Miyakoshi.
Journal of the Water Pollution Control Federation, Vol 52, No 5, p 923-930, May, 1980. 8 Fig, 1 Tab.

Descriptors: *Sewers, *Construction, *Soil strength, Structural engineering, Earthworks, Design, Soil density, Performance, Shield method, Japan, *Yokohama(Japan).

The shield method of sewer construction was used in Yokohama (Japan) to construct sewers in damp, soft soil. A recent development is the controlled soil pressure shield, in which excavated soil is used to stabilize the face when adjusting the volume of discharged soil. A mud-slurry pressure shield has also been developed, in which the pressure of the mud slurry stabilizes the face while adjusting the volume of fed and discharged slurry. Examples are given of sewer construction in soft ground, the blind shield method, the mud slurry pressure shield method, controlled soil pressure shield method, and the shield method in a sandy layer with confined water. Shields which have been recently developed or improved are tail void filling, peat, gravel layer, and small diameter shields. In Yokohama, there are presently eight waste water treatment plants in operation and three more under construction, and the total length of sewers is 3160 km spread through hills and soft soil near the river. (Small-FRC)
W81-01766

UNIQUE DESIGN FEATURES OF KOBE'S WASTE WATER TREATMENT PLANT,
Japan Sewage Works Bureau, Kobe.
K. Nakai.
Journal of the Water Pollution Control Federation, Vol 52, No 5, p 955-960, May, 1980. 2 Fig, 1 Tab.

Descriptors: *Treatment facilities, *Costs, *Recreation facilities, Swimming pools, Activated sludge, *Waste water treatment, Odor, Activated carbon, Cities, Japan, *Kobe area(Japan).

The unique design features of the Tarumi waste water treatment plant and community center, the latest plant to be constructed in the densely inhabited (13,255 people/ha) Kobe area (Japan), are described. The plant servs 144,000 people and has a waste water volume of 54,720 cu m/day. The final effluent is discharged into the Seto Inland Sea after conventional activated sludge processing and dewatering. Dewatered cakes are disposed of at a landfill. The waste water treatment center is built beneath several swimming pools, tennis courts, a playground, and a parking lot. Offensive odors are carefully controlled at the plant, since it functions as a community center. Synthesized adhesive carbon absorption, active carbon absorption and ozone masking are used for odor control. Since its establishment five years ago, the center is used by about 1000 people a day. About 1000 swimmers a day use the pools, although there is an admission charge. The facility cost 195 million yen (210 yen = 1 US dollar in 1978) for the land, 5589 million yen for the treatment plant, 387 million yen for the Community Center, and 367 million yen for the various other facilities. (Small-FRC)
W81-01795

DESIGN OF MULTISTORY SETTLING TANKS IN OSAKA,
Japan Sewage Works Bureau, Osaka.
K. Matsunaga.
Journal of the Water Pollution Control Federation, Vol 52, No 5, p 950-954, May, 1980. 5 Fig, 1 Tab.

Descriptors: *Settling tanks, *Construction, *Design, Pipes, Weirs, Aeration, *Engineering structures, Land use, Multistory structures, Japan, *Osaka(Japan).

The construction of settling tanks two or three stories high or the installation of an aeration tank on top of a final settling tank have been planned for the efficient utilization of limited available land in Osaka, Japan. Special equipment is necessary for such facilities, including aeration equipment in the inflow conduit, perforated pipes or overflow weirs for outlet equipment, telescopic outlet pipes, and assembled-type outlet pipes. Sludge collectors tend to have chain wear on one side as the result of looseness or twisting, so the tension of the chain must be monitored. Aeration tanks are available that are assembled on final settling tanks, and assembled-type outlet pipes are necessary. Tests at a two story treatment plant demonstrated that effluent can successfully be withdrawn over triangular notch-type weirs for the upper tanks and through telescopic-type outlet pipes for the lower tanks. Assembled-type outlet pipes are used at the three-story Tsumori Sewage Treatment Plant to equalize inflow rate. (Small-FRC)
W81-01797

AGING URBAN WATER SYSTEMS: A COMPUTERIZED CASE STUDY,
Betz, Converse, Murdoch Inc., Plymouth Meeting, PA.
D. K. O'Day, C. M. Fox, and G. M. Huguet.

Public Works, Vol 111, No 8, p 61-64, 111, August, 1980. 2 Fig, 3 Tab.

Descriptors: *Water distribution(Applied), *Lateral conveyance structures, *Aging(Physical), Data processing, Evaluation, Leakage, Durability, *New York, Public utilities, Water conveyance, Surveys, Performance, Urban areas, Conduits, Pipelines, Deterioration, Surveys.

An engineering and computer analysis of the New York City water distribution system was performed to study the relationship between water main breaks and the structural integrity of the water mains. The study evaluated the causes of all main breaks, identified any discernable patterns or trends in breaks, and recommended measures to alleviate water main break problems. The methodology developed for this study can assist water system managers in making sound decisions about pipe replacement during the course of roadway reconstruction or utility work. Also, the methodology can be used to plan five or ten years ahead. The study found that New York's system is not wearing out because of age and there is no evidence that the cast iron pipes are deteriorating. Small diameter mains had the highest breakage rate due to bedding problems. These bedding problems are often caused by leaks. Location seemed to be the single most important factor in breakage; a 19th century system cannot meet 20th century stress. (Small-FRC)
W81-01877

TREATMENT STRUCTURE SUPPORT OVER DIFFICULT SOILS,
Associated Pile and Fitting Corp., Clifton, NJ.
H. W. Hunt.
Public Works, Vol 111, No 9, p 131-134, September, 1980. 5 Fig.

Descriptors: *Soil engineering, *Water storage, *Piles(Foundation), Waste storage, *Engineering structures, Concrete piles, Timber piles, Construction materials, Design criteria.

Support structures over difficult soils are considered. Structures must be free of settlement if they are to be used for waste water handling to prevent contaminants from seeping out of cracks or causing additional damage to the initial structure. Design limitations should require no more than 1/2 inch differential settlement between tanks or structures. Good design requires dependable borings to provide subsurface information and to enable the builder to gain adequate and current information. Various types of piles are considered, including the non-displacement H-pile, precast concrete piles, composite piles, and timber piles. In planning the construction at least one boring should be made for each 2,500 square feet of space. Standard sampling spoon procedures should be used and blows recorded. All information concerning subsurface conditions must be made available to prospective bidders. (Baker-FRC)
W81-01880

PROBLEMS OF CORROSION CONTROL IN WATER DISTRIBUTION SYSTEMS,
L. M. Applegate.
Public Works, Vol 111, No 7, p 54-57, July, 1980. 3 Fig.

Descriptors: *Corrosion control, *Cathodic protection, Water distribution(Applied), Water delivery, Coating, Pitting(Corrosion), Pipes, *Pipelines, *Water conveyance, California, *Oroville(CA).

Corrosion control problems encountered in the water system of Thermalito Irrigation District in Oroville, California, are described. The district is served by a small reservoir, a good well and a filtration plant. A 20-inch main with lateral branches extends a few miles from the filtration plant, and here occasionally leaks have occurred. A cathodic protection system has been installed to protect against such leaks. Cathodic protection for the system was established in two parts. A 2 million gallon flat bottomed water tank at the filtration plant was the site of the first cathodic protection. Second, a 50-volt, 50-ampere rectifier and a large anode bed in a heavy gravel-soil pasture east of the tank were built. The soil resistivity there was typical of good agricultural soils, 2500 ohm-cm. Use of small multiple rectifiers and small anode beds, characteristic of gas line protection, are recommended for use in water systems, as they would tend to equalize the potentials on adjacent water and gas lines. Interference would be lowered and could be eliminated. (Baker-FRC)

THE TRINIDAD WATER PROJECTS,
CH2M/Hill International, Corvallis, OR.
L. A. Dove.
Public Works, Vol 111, No 7, p 69-72, July, 1980. 5 Fig.

Descriptors: *Construction, *Water supply development, Design standards, Design, Water supply, Water demand, Water delivery, Water yield improvement, *Trinidad.

The development of a US$250 million water supply and transmission system for the island of Trinidad is reviewed. The first phase involved design and construction of the Navet dam, reservoir, and pumping station, and expansion of the treatment plant serving critical areas in central and south Trinidad. The system's capacity was increased from 14 mgd to 23 mgd. The second phase is the Caroni-Arena Project, a 100 ft high seasonal storage dam, a 72 mgd Caroni water treatment plant, and a water transmission system to serve areas west of Port-of-Spain and southwest to San Fernando. The third phase is the Interim Water Supply Project, which is currently relieving water problems in north Trinidad in the short-term. In a period of 10 years the Republic of Trinidad and Tobago will have tripled its available water supply and will continue to grow to serve increasing numbers of customers with good quality water. IMPROVED IMPLICIT PROCEDURE FOR MULTICHANNEL SURGE COMPUTATIONS,
Hydro and Power Authority, Vancouver (British Columbia).
K-H. Kao.
Canadian Journal of Civil Engineering, Vol 7, No 3, p 502-512, September, 1980. 18 Fig, 4 Tab, 4 Ref.

Descriptors: *Model studies, *Tailrace, *Open channel flow, Mathematical models, Channels, Equations, Computer programs, British Columbia, Peace River, Finite element analysis, Surges.

When the explicit finite difference technique is applied to solve the equations for unsteady open channel flows, the duration of each time step is restricted by the Courant condition. Often the time step becomes too small for efficient computation. To overcome this problem, a method of numbering the computation points along a system of waterways is proposed. When the system is composed of many channels and each branch watercourse is assumed to be one-dimensional, the proposed numbering technique will generate a narrow diagonally banded coefficient matrix of simultaneous equations. An IBM computer program (GELB) may be used to solve the system of simultaneous equations. This yields a significant decrease in computing time as well as a reduction in computer storage requirements. The procedure was applied to the Y-shaped channel of the tailrace system of Portage Mountain Development on the Peace River in British Columbia. Computed and hydraulic model tests results for this system showed close agreement. (Geiger-FRC)

WINTER ICE REMOVAL FROM STOCK WATER PONDS,
Oklahoma State Univ., Stillwater. Dept. of Agricultural Engineering.
J. E. Garton, T. Ghermazien, and K. Robinson.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-167207, Price codes: A03 in paper copy, A01 in microfiche. Oklahoma Water Resources Research Institute, Oklahoma State University Project Completion Report, September, 1980. 34 p, 18 Fig, 6 Tab. OWRT-A-086-OKLA(1), 14-34-0001-9038.

Descriptors: *Ice-water interfaces, *Melting, *Cattle, *Stock water, *Hydraulic equipment, Water circulation, *Farm ponds, Potable water, Ice, Ice cover, Climatology, Freezing, Ice breakup, Water sources, Domestic animals, Livestock, Ruminants, Trawling, Motor generators, Pumps, Pump testing, Turnovers, Pumping, Thermal stratification, Bodies of water, Ponds, Water holes.

The purpose of this study was to find a practical, reliable, and inexpensive method for melting ice on farm ponds during the winter to allow livestock accessibility to water. An alternative means of removing ice from the near-shore surface of ponds was found, rather than requiring that farmers/ranchers routinely chip holes in the ice. The performances of two methods were tested: (1) use of an electrically-operated submersible pump; and (2) a wind-electric generator directly connected to an electric trolling motor, to stimulate conditions in remote locations lacking electricity. By either technique, warmer water from greater depths was circulated to the surface of the pond. A water jet was directed upward at a 45 degree angle towards the shore in each of three ponds studied. It was concluded that, with electricity available, submersible pumps would be more economical than use of an electric trolling motor, trickle charger and battery, due to equipment and maintenance costs of the latter system. For remote ponds with no available electricity, the wind-electric plant can be directly connected to the trolling motor; refreezing of the hole on calm days resulted in only relatively thin ice cover that could be broken by cattle. W81-01651

AN INEXPENSIVE INSTRUMENT FOR MEASURING SOIL WATER TABLE LEVELS,
Department of Agriculture, Saint-Jean (Quebec). Research Station.
J. A. Campbell, J. A. Millette, and M. Roy.
Canadian Journal of Soil Science, Vol 60, No 3, p 575-577, August, 1980. 2 Fig, 1 Tab, 1 Ref.

Descriptors: *Water table, *Water level recorders, Instrumentation, Water measurement, Soil water, On-site tests, Metal pipes, Hydraulic structure, Plastic pipes, Potentiometers, Observation wells.

A simple and inexpensive instrument for measuring soil water table levels is described. The apparatus is an improvement upon previous implements because it overcomes the problem of metal contamination of water samples from the use of metal wells. The new instrument, which may be used with metal or plastic wells, features a probe which is inserted into a well, and a meter box. The probe is made of CPVC pipe with a vinyl tape epoxied to the outside of it. A two-conductor instrument cable bifurcates to form two electrodes which are soldered to prevent corrosion from acid soil water. A two-connector phono plug is connected to the other end of the cable. The meter components are diagrammed, and calibration procedures for the instrument are given. Accuracies of the measurements are within + or - 1 mm, and field and greenhouse tests with the new device have given very reliable results. (Geiger-FRC)

Cyanide Problems in Municipal Waste Water Treatment Plants,
W81-01819 5B

CYANOPHYTA
An Evaluation of Lime Treatment and Sand Drying Beds for Upgrading Stabilization Pond Effluent,
W81-01653 5C

DADE COUNTY (FL)
Summary of Water-Level and Discharge Records for the East Everglades Area, Dade County, Florida,
W81-01673 7C

DAPHNIA
Selective Predation by Mysids inLake Restoration by Biomanipulation,
W81-01696 5A

DATA COLLECTIONS
Summary of Water-Level and Discharge Records for the East Everglades Area, Dade County, Florida,
W81-01673 7C

Statistical Summaries of Selected Streamflow Data--South Platte River in Colorado and Nebraska; North Platte and Platte Rivers in Nebraska,
W81-01676 2E

Development and Application of a Water Supply Cost Analysis System; Volume I,
W81-01682 6C

Satellites as Aid to Water Resource Managers,
W81-01840 7B

DATA STORAGE AND RETRIEVAL
A Case Study of Computerized Industrial Waste Data,
W81-01887 7C

DECOMPOSING ORGANIC MATTER
Production of Urea by Bacterial Decomposition of Organic Matter Including Phytoplankton,
W81-01866 5B

DENTRIFICATION
Biological Denitrification in an Upflow Sludge Blanket Reactor,
W81-01858 5D

DESALINATION
Sparged Air Distilled Water Recovery System,
W81-01712 3A

Ion Exchange Process for Desalination,
W81-01731 3A

Development of Improved Cleaning and Surface Regeneration Methods and Economic Analysis of these Methods for Seawater Membranes.
W81-01757 3A

Data Collection and Analysis of Commercial Membrane Desalination Plants--Volume I--Summary,
W81-01758 3A

Data Collection and Analysis of Commercial Membrane Desalination Plants--Volume II--Reverse Osmosis Plants,
W81-01759 3A

Data Collection and Analysis of Commercial Membrane Desalination Plants--Volume III--Electrodialysis/Electrodialysis Reversal Plants,
W81-01760 3A

DESALINATION APPARATUS
Sparged Air Distilled Water Recovery System,
W81-01712 3A

DESALINATION PROCESSES
Development of Hollow Fiber Reverse Osmosis Membranes,
W81-01652 3A

DESIGN
Solids Separation in Activated Sludge System Design and Operation,
W81-01793 5D

Design of Multistory Settling Tanks in Osaka,
W81-01797 8A

DESIGN CRITERIA
Facultative Waste Stabilization Pond Design,
W81-01809 5D

DESIGN STANDARDS
Scaleup in Rotating Biological Contactor Design,
W81-01820 5D

DESIGNS
Synthesis of Waste Treatment Systems by Implicit Enumeration,
W81-01811 5D

DESTRATIFICATION
A Fish-Kill in Heart Lake, Ontario, Associated With the Collapse of a Massive Population of Ceratium Hirundinella (Dinophyceae),
W81-01868 5C

DETENTION RESERVOIRS
Detention Basin Settleability of Urban Runoff Pollution Phase II,
W81-01756 5G

DEWATERING
Sludge Dewatering Plant Uses Programmable Controllers.
W81-01896 6D

DIFFUSION
An Investigation of the Initial Dilution of Sewage Discharged through Submarine Diffusers,
W81-01810 5D

DIPTERA
Chironomid Farming-A Means of Recycling Farm Manure and Potentially Reducing Water Pollution in Hong Kong,
W81-01776 5G

Chironomidae Communities of the River Nida and its Tributaries,
W81-01790 5C

DISINFECTION
Comparison of Chlorine Dioxide and Chlorine in Waste Water Disinfection,
W81-01792 5D

DISSOLVED OXYGEN
Dissolved Oxygen Measurements in Ohio Streams Following Urban Runoff,
W81-01684 5B

Impact of Sediments on Dissolved Oxygen Concentrations Following Combined Sewer Overflows,
W81-01843 5B

Influence of Biological and Physical Processes on Dissolved Oxygen Dynamics in an Estuarine System: Implications for Measurement of Community Metabolism,
W81-01863 2L

DOMESTIC WASTES
Sources of Toxic Compounds in Household Wastewater,
W81-01683 5B

Apparatus for Renovation of Sanitary Waters,
W81-01717 5D

On-Site Waste Water Treatment on Problem Soils,
W81-01824 5D

Septic System Problems on an Urban Fringe,
W81-01836 5D

DOMINANT SPECIES
Chironomidae Communities of the River Nida and its Tributaries,
W81-01790 5C

DRAINAGE AREA
Investigations of Small, Man-Made Impoundments on the Hydrology of the Lower Oak Creek Drainage Area, Coconino and Yavapai Counties, Arizona,
W81-01754 4A

DRAINAGE ENGINEERING
Investigations of Small, Man-Made Impoundments on the Hydrology of the Lower Oak Creek Drainage Area, Coconino and Yavapai Counties, Arizona,
W81-01754 4A

DROUGHT
Resisting the Drought,
W81-01749 2E

DROUGHT RESISTANCE
Resisting the Drought,
W81-01749 2E

DROUGHTS
Drought and Our Destiny,
W81-01750 2B

Agricultural Runoff During a Drought Period,
W81-01788 2E

DUAL PURPOSE DETENTION BASINS
Detention Basin Settleability of Urban Runoff Pollution Phase II,
W81-01756 5G

DUNKIRK (FRANCE)
Dunkirk: An Example of Water Resources Optimisation. (Dunkerque: Un Exemple D'Optimisation Des Ressources En Eau),
W81-01774 4B

EARTHQUAKE ENGINEERING
Drainage Basin Contamination Prompts Regional Planning,
W81-01889 5D

EBRIE LAGOON (IVORY COAST-AFRICA)
Inorganic Phosphate Uptake in a Brackish Tropical Lagoon,
W81-01871 5C

ECOLOGY
Ecology of Southern African Estuaries. Part XI. Mngazana: A Mangrove Esturary in Transkei,
W81-01744 2L

ECONOMICS
Treated Water Demand and the Economics of Regionalization; Volume 2, Economics of Regionalization: The Electric Power Example,
W81-01680 6C

ECOSYSTEMS
Cadmium in Forest Ecosystems,
W81-01654 5C

Selective Predation by Mysids inLake Restoration by Biomanipulation,
W81-01696 5A

Lake Kinneret: Carbon Flow Patterns and Ecosystem Management,
W81-01777 2H

Experimental Acidification of a Stream in the Hubbard Brook Experimental Forest, New Hampshire,
W81-01900 5C

EDAPHIC ALGAE
An Evaluation of Lime Treatment and Sand Drying Beds for Upgrading Stabilization Pond Effluent,
W81-01653 5C

EFFLUENTS
Current Status of Water Reclamation at Windhoek,
W81-01822 5D

Studies on the Toxicity of Pulp and Paper Mill Effluents-I. Mutagenicity of the Sediment Samples Derived from Kraft Paper Mills,
W81-01846 5A

ELECTRODIALYSIS
Data Collection and Analysis of Commercial Membrane Desalination Plants--Volume I--Summary,
W81-01758 3A

Data Collection and Analysis of Commercial Membrane Desalination Plants--Volume III--Electrodialysis/Electrodialysis Reversal Plants,
W81-01760 3A

ELECTROFLOTATION
Process and Device for the Purification of Waste Water by Means of Electroflotation,
W81-01735 5D

ELECTROPHORESIS
The Effect of Aluminium and Ferric Ions on the Electrophoretic Mobility of Particles in Treated Piggery Effluents,
W81-01852 5D

ENERGY
Energy Autonomy in the Waste Water Treatment Process,
W81-01818 5E

Conflict Between Energy Conservation and Water Pollution Control Standards,
W81-01821 6E

Alternative Fuels for Multiple-Hearth Furnaces,
W81-01832 5E

ENGINEERING STRUCTURES
Design of Multistory Settling Tanks in Osaka,
W81-01797 8A

Treatment Structure Support Over Difficult Soils,
W81-01880 8A

ENVIRONMENTAL CONTROL
Environmental Control of Pithophora Oedogonia (Chlorophyceae) Akinete Germination,
W81-01699 5C

ENVIRONMENTAL EFFECTS
Water Quality and Biological Effects of Urban Runoff on Coyote Creek; Phase I - Preliminary Survey,
W81-01687 5C

Handling of Combustion and Emission-Abatement Wastes From Coal-Fired Power Plants: Implications for Fish and Wildlife Resources,
W81-01688 5C

Experimental Acidification of a Stream in the Hubbard Brook Experimental Forest, New Hampshire,
W81-01900 5C

ENVIRONMENTAL ENGINEERING
State/EPA Agreement, FY 81.
W81-01743 6E

ENVIRONMENTAL GRADIENT
Seasonal Variation in Species Composition of Recently Settled Fouling Communities Along an Environmental Gradient in the Indian River Lagoon, Florida,
W81-01870 2L

ENZYMES
An Enzymatic Pretreatment to Enhance the Lime Precipitability of Pulp Mill Effluents,
W81-01848 5D

EPIDEMIOLOGY
Evaluation of the False-Positive Enteroviral Plaque Phenomenon Occurring in Sewage Samples,
W81-01857 5A

ESTUARIES
Ecology of Southern African Estuaries. Part XI. Mngazana: A Mangrove Esturary in Transkei,
W81-01744 2L

A Mathematical Model of the Koksoak River. (Modele Mathematique De La Riviere Koksoak),
W81-01781 2L

Total Mercury and Methyl Mercury Levels in British Estuarine Sediments - II,
W81-01856 5A

Influence of Biological and Physical Processes on Dissolved Oxygen Dynamics in an Estuarine System: Implications for Measurement of Community Metabolism,
W81-01863 2L

Comparison of Methods for Analysis of the Transverse and Vertical Circulation Contributions to the Longitudinal Advective Salt Flux in Estuaries,
W81-01864 2L

Wave Influences on River-Mouth Depositional Process: Examples from Australia and Papua New Guinea,
W81-01872 2L

ESTUARINE ENVIRONMENT
Ecology of Southern African Estuaries. Part XI. Mngazana: A Mangrove Esturary in Transkei,
W81-01744 2L

EUTROPHICATION
Maximum Utilization of Water Resources in a Planned Community; Eutrophication Potential of Surface Waters in a Developing Watershed, W81-01685 5C

A Fish-Kill in Heart Lake, Ontario, Associated With the Collapse of a Massive Population of Ceratium Hirundinella (Dinophyceae), W81-01868 5C

Toxicities of Microcystis Aeruginosa Collected from Some Lakes, Reservoirs, Ponds and Moat in Tokyo and Adjacent Regions, W81-01876 5C

Finding the Right RX for Tastes and Odors, W81-01894 5F

EVALUATION
Water-Resources Appraisal of the South-Arkansas Lignite Area, W81-01674 5G

EVAPORATION
Evaporation from a Sphagnum Moss Surface, W81-01738 2D

Prediction of the Volatilization Rates of High-Volatility Chemicals from Natural Water Bodies, W81-01899 5B

EVAPORATIVE LOSS MODEL
Application of an Evaporative Loss Model to Estimate the Persistence of Contaminants in Lentic Environments, W81-01698 5A

EVAPOTRANSPIRATION
Evaporation from a Sphagnum Moss Surface, W81-01738 2D

Effect of Precipitation and Evapotranspiration of a Septic Tank-Sand Filter Disposal System, W81-01800 5D

FARM MANAGEMENT
Resisting the Drought, W81-01749 2E

FARM PONDS
Winter Ice Removal from Stock Water Ponds, W81-01651 8C

FARM WASTES
The Effect of Aluminium and Ferric Ions on the Electrophoretic Mobility of Particles in Treated Piggery Effluents, W81-01852 5D

FEASIBILITY STUDIES
Analysis of Water Resources Planning and Decision-Making Processes and Outcomes, W81-01755 6A

FERTILIZERS
Solids Handling Systems for Six Different Disposal Options, W81-01830 5E

FILTRATION
Combined Membrane Filtration-Electrochemical Microbial Detection Method, W81-01769 5A

FINANCING
Alberta Environment Minister Foresees Many Challenges for Province in the '80's. W81-01851 6E

FISH
Transmission of Various Salmonellae Among Fish (Crassius Autatus) in the Aquatic Environment, W81-01692 5C

Recent Concepts and Development of an Automated Biological Monitoring System, W81-01844 5A

FISH DISEASES
Transmission of Various Salmonellae Among Fish (Crassius Autatus) in the Aquatic Environment, W81-01692 5C

FISH FARMING
Aquaculture in South East Asia: Some Points of Emphasis, W81-01767 3C

FISH PHYSIOLOGY
Health Considerations in the Preparation of Drinking Water from the River Rhine, W81-01753 5C

FISH REPRODUCTION
Effects of Heated Effluent on the Reproductive Biology of White Crappie, Pomoxis Annularis in Conowingo Pond, Pennsylvania, W81-01833 5C

FISH TOXINS
Government Philosophy and Activities, W81-01705 5C

FISHERIES
Government Philosophy and Activities, W81-01705 5C

The Present State of Pollution Control Technology for the Fishing Industry, W81-01706 5D

FISHKILL
A Fish-Kill in Heart Lake, Ontario, Associated With the Collapse of a Massive Population of Ceratium Hirundinella (Dinophyceae), W81-01868 5C

FLOATING SLUDGE
Resolution of an Industrial Waste Dilemma, W81-01879 5C

FLOOD CONTROL
Brook Rechanneling Demands Inter-Agency Coordination, W81-01884 2E

FLOOD FORECASTING
Approximate Method for Quick Flood Plain Mapping, W81-01837 2E

Man Outmatches Math Models for Flood Frequency, W81-01882 2A

FLOOD PLAIN MAPPING
Approximate Method for Quick Flood Plain Mapping, W81-01837 2E

FLOOD PLAINS
River Management in the Urban Environment, W81-01748 4C

FLOOD PROFILES
Approximate Method for Quick Flood Plain Mapping, W81-01837 2E

FLOOD PROTECTION
Investigations of Small, Man-Made Impoundments on the Hydrology of the Lower Oak Creek Drainage Area, Coconino and Yavapai Counties, Arizona, W81-01754 4A

FLOOD ROUTING
Approximate Method for Quick Flood Plain Mapping, W81-01837 2E

Brook Rechanneling Demands Inter-Agency Coordination, W81-01884 2E

FLORIDA
Chemical and Physical Characteristics of Precipitation at Selected Sites in Florida, W81-01666 2K

Summary of Water-Level and Discharge Records for the East Everglades Area, Dade County, Florida, W81-01673 7C

Water Resources Data for Florida, Water Year 1979--Volume 4. Northwest Florida. W81-01679 7C

The Constant Percent Rule in Intra-Sectoral Water Allocation, W81-01739 6C

FLOW CHARACTERISTICS
Flow Characteristics of New Mexico Streams, Part I. Flow Duration, W81-01667 2E

FLOW CONTROL
Urban Runoff Management Strategies, W81-01658 4C

FLOW DURATION
Flow Characteristics of New Mexico Streams, Part I. Flow Duration, W81-01667 2E

FLOW MEASUREMENT
Irrigation-Hydrometry (Besproeiing - Watermeting), W81-01746 3F

FLOW SYSTEM
Irrigation-Hydrometry (Besproeiing - Watermeting), W81-01746 3F

FLOWMETERS
Irrigation-Hydrometry (Besproeiing - Watermeting), W81-01746 3F

FLUCTUATIONS
Comparison of Methods for Analysis of the Transverse and Vertical Circulation Contributions to the Longitudinal Advective Salt Flux in Estuaries, W81-01864 2L

FOOD PROCESSING INDUSTRY
Method and Apparatus for the Enhanced Treatment of Food Processing Waste Waters Using Aerobic Microorganisms, W81-01722 5D

Indicator Bacteria and Salmonella in Food-Processing and Domestic Effluent, W81-01802 5D

FOOD WEBS
Lake Kinneret: Carbon Flow Patterns and Ecosystem Management, W81-01777 2H

FOREST WATERSHEDS
Non-Point Source Pollution in Forest Streams of the Western Olympic Mountains, W81-01695 5B

Evaluation of Mangement Practices on the Biological and Chemical Characteristics of Stream flow from Forested Watersheds, W81-01763 4C

FORESTS
Cadmium in Forest Ecosystems, W81-01654 5B

FOULING ORGANISMS
Seasonal Variation in Species Composition of Recently Settled Fouling Communities Along an Environmental Gradient in the Indian River Lagoon, Florida,
W81-01870 2L

FUELS
Alternative Fuels for Multiple-Hearth Furnaces,
W81-01832 5E

FULVIC ACIDS
Seasonal Variations in Trihalomethane Levels in an Iowa River Water Supply,
W81-01709 5B

GENETICS
Studies on the Toxicity of Pulp and Paper Mill Effluents-I. Mutagenicity of the Sediment Samples Derived from Kraft Paper Mills,
W81-01846 5A

GEOCHEMISTRY
Sulfate Reduction in Ground Water of Southeastern Montana,
W81-01662 5A

GERMINATION
Environmental Control of Pithophora Oedogonia (Chlorophyceae) Akinete Germination,
W81-01699 5C

GLACIERS
Columbia Glacier, Alaska: Recent Ice Loss and its Relationship to Seasonal Terminal Embayments, Thinning, and Glacial Flow,
W81-01672 7C

GOVERNMENTAL INTERRELATIONS
Analysis of Water Resources Planning and Decision-Making Processes and Outcomes,
W81-01755 6A

GRANTS
Alberta Environment Minister Foresees Many Challenges for Province in the '80's.
W81-01851 6E

GRAPHICAL ANALYSIS
Man Outmatches Math Models for Flood Frequency,
W81-01882 2A

GRAVELINE BAY MARSH (MS)
An Evaluation of Lime Treatment and Sand Drying Beds for Upgrading Stabilization Pond Effluent,
W81-01653 5C

GRAVELS
The Volume of Sand and Gravel Resources in the Lower Bay of New York Harbor,
W81-01740 2J

GREASE
Bacteria Can Solve Malodours and Grease Problems in Treatment Plants.
W81-01849 5D

GREAT SOUTH BAY (NY)
Characteristics of the Groundwater Seepage into Great South Bay,
W81-01741 2F

GROUNDWATER
Hydrology and Model Study of the Proposed Prosperity Reservoir, Center Creek Basin, Southwestern Missouri,
W81-01660 2F

Distribution of Nitrate in the Unsaturated Zone, Highland-East Highlands Area, San Bernardino County, California,

LAKE SEDIMENTS
Chemical Composition of Recent bottom Sediments of the Lake Zagnanie,
W81-01791 5B

LAKE SUWA (JAPAN)
Production of Urea by Bacterial Decomposition of Organic Matter Including Phytoplankton,
W81-01866 5B

LAKE WASHINGTON (WA)
Selective Predation by Mysids inLake Restoration by Biomanipulation,
W81-01696 5A

LAKE ZAGNANIE (POLAND)
Chemical Composition of Recent bottom Sediments of the Lake Zagnanie,
W81-01791 5B

LAKES
Epifaunal Invertebrates as Monitors of Water Quality in Lake Pontchartrain,
W81-01700 5C

Liming Acid Lakes in Sweden,
W81-01814 5G

Toxicities of Microcystis Aeruginosa Collected from Some Lakes, Reservoirs, Ponds and Moat in Tokyo and Adjacent Regions,
W81-01876 5C

LAND APPLICATION
Waste Water Spray Transport in Land Application,
W81-01761 5A

LAND RECLAMATION
Revegetation of Mined Land Using Waste Water Sludge,
W81-01885 4D

Revegetation Project Utilizes Sludge,
W81-01886 4D

LAND USE
Rural Nonpoint Source Water Quality in a Southeastern Watershed,
W81-01804 5B

LANDFILLS
Toxicity of Landfill Leachates,
W81-01828 5C

LATERAL CONVEYANCE STRUCTURES
Aging Urban Water Systems: A Computerized Case Study,
W81-01877 8A

LEACHATE
Toxicity of Landfill Leachates,
W81-01828 5C

LEAKAGE
Report on Water Losses,
W81-01773 5F

LEGISLATION
Water Pollution Control in Japan,
W81-01794 6E

Waste Water Treatment Works in Japan: Status and Outlook,
W81-01826 5D

LENTIC ENVIRONMENT
Application of an Evaporative Loss Model to Estimate the Persistence of Contaminants in Lentic Environments,
W81-01698 5A

LIGHT PENETRATION
The Effects of Light on the Dissipation of Chlorine in Sea-Water,
W81-01690 5B

A Simple and Inexpensive 4-PI Light Collector and Two Designs for a Light Meter for Light Attenuation Studies,
W81-01873 7B

LIGNITE
Water-Resources Appraisal of the South-Arkansas Lignite Area,
W81-01674 5G

LIME
Liming Acid Lakes in Sweden,
W81-01814 5G

The Inactivation of Faecal Coliforms and Ascaris Ova in Faeces by Lime,
W81-01855 5D

Experimental Land Treatment System Processes Mine Drainage.
W81-01897 5D

LIME TREATMENT
An Evaluation of Lime Treatment and Sand Drying Beds for Upgrading Stabilization Pond Effluent,
W81-01653 5C

LOS ANGELES COUNTY
Sludge Dewatering Plant Uses Programmable Controllers.
W81-01896 6D

MAPPING
Columbia Glacier, Alaska: Recent Ice Loss and its Relationship to Seasonal Terminal Embayments, Thinning, and Glacial Flow,
W81-01672 7C

MATHEMATICAL MODELS
Adsorption Mass Transfer Model for Virus Transport in Soils,
W81-01711 5B

A Method for the Calculation of Biological Film Volume in a Fluidized Bed Biological Reactor,
W81-01805 5D

Modeling Infiltration,
W81-01847 2G

Man Outmatches Math Models for Flood Frequency,
W81-01882 2A

MAYFLIES
On the Benthic Fauna of some River Systems in Nagasaki District (4). The Sasu and the Se Rivers of Tsushima in Summer (In Japanese),
W81-01874 5C

MELTING
Winter Ice Removal from Stock Water Ponds,
W81-01651 8C

MEMBRANE PROCESSES
Development of Hollow Fiber Reverse Osmosis Membranes,
W81-01652 3A

Development of Improved Cleaning and Surface Regneration Methods and Economic Analysis of these Methods for Seawater Membranes.
W81-01757 3A

Data Collection and Analysis of Commercial Membrane Desalination Plants--Volume I--Summary,
W81-01758 3A

Data Collection and Analysis of Commercial Membrane Desalination Plants--Volume II--Reverse Osmosis Plants,
W81-01759 3A

Data Collection and Analysis of Commercial Membrane Desalination Plants--Volume III--Electrodialysis/Electrodialysis Reversal Plants,
W81-01760 3A

MEMBRANES
Combined Membrane Filtration-Electrochemical Microbial Detection Method,
W81-01769 5A

MERCURY
Total Mercury and Methyl Mercury Levels in British Estuarine Sediments - II,
W81-01856 5A

METALS
The Effect of Surfactants on the Mixed Chelate Extraction-Atomic Absorption Spectrophotometric Determination of Copper, Nickel, Iron, Cobalt, Cadmium, Zinc and Lead,
W81-01859 5A

MICROBIOLOGY
Combined Membrane Filtration-Electrochemical Microbial Detection Method,
W81-01769 5A

MICROCALORIMETRY
Calorimetric Studies of Biodegradation Processes in Biological Waste Water Treatment,
W81-01806 5D

MICROORGANISMS
Effects of Adaptation on Biodegradation Rates in Sediment/Water Cores from Estuarine and Freshwater Environments,
W81-01772 5B

MILWAUKEE (WI)
Impact of Sediments on Dissolved Oxygen Concentrations Following Combined Sewer Overflows,
W81-01843 5B

MINE DRAINAGE
Water-Quality Assessment of the Cypress Creek Watershed, Warrick County, Indiana,
W81-01664 5B

MINE WASTES
On the Benthic Fauna of some River Systems in Nagasaki District (4). The Sasu and the Se Rivers of Tsushima in Summer (In Japanese),
W81-01874 5C

MINING
A Subsurface Water Quality Model for Western Surface Mine Sites,
W81-01751 5B

Revegetation Project Utilizes Sludge,
W81-01886 4D

MISSISSIPPI
Quality of Water and Time of Travel in Yockanookany River, Choctaw County, Mississippi,
W81-01675 5B

MISSOURI
Hydrology and Model Study of the Proposed Prosperity Reservoir, Center Creek Basin, Southwestern Missouri,
W81-01660 2F

Engineering Analysis of the Cost/Benefit Relationship for Rural Water Supply Treatment Systems,
W81-01691 5F

MODEL STUDIES
Observations on Kinematic Response in Urban Runoff Models,
W81-01659 4C

Hydrology and Model Study of the Proposed Prosperity Reservoir, Center Creek Basin, Southwestern Missouri,
W81-01660 2F

Hydrologic Analysis of the Proposed Badger-Beaver Creeks Artificial Recharge Project, Morgan County, Colorado,
W81-01670 6A

Mathematical Model for Water Quality in Streams Impacted by Point and Nonpoint Source Pollution,
W81-01694 5B

Improved Implicit Procedure for Multichannel Surge Computations,
W81-01779 8B

A Mathematical Model of the Koksoak River. (Modele Mathematique De La Riviere Koksoak),
W81-01781 2L

Facultative Waste Stabilization Pond Design,
W81-01809 5D

Comparison of Methods for Analysis of the Transverse and Vertical Circulation Contributions to the Longitudinal Advective Salt Flux in Estuaries,
W81-01864 2L

MONITORING
Automatic Water Quality Analyzers for Waste Water Collection and Treatment,
W81-01798 5A

Recent Concepts and Development of an Automated Biological Monitoring System,
W81-01844 5A

MORGAN COUNTY (CO)
Hydrologic Analysis of the Proposed Badger-Beaver Creeks Artificial Recharge Project, Morgan County, Colorado,
W81-01670 6A

MORTALITY
Parametric Analyses of Mortality Rates in Bioassays,
W81-01861 5C

MOSSES
Evaporation from a Sphagnum Moss Surface,
W81-01738 2D

MULTIPLE-PURPOSE RESERVOIRS
Hydrology and Model Study of the Proposed Prosperity Reservoir, Center Creek Basin, Southwestern Missouri,
W81-01660 2F

MUNICIPAL WASTES
Cyanide Problems in Municipal Waste Water Treatment Plants,
W81-01819 5B

Effects of Water Conservation on Municipal Waste Water Treatment Facilities,
W81-01831 5D

MUSSELS
Rapid Induction of Copper-Binding Proteins in the Gills of Metal Exposed Mussels,
W81-01785 5C

NAGASAKI
On the Benthic Fauna of some River Systems in Nagasaki District (4). The Sasu and the Se Rivers of Tsushima in Summer (In Japanese),
W81-01874 5C

NEBRASKA
Statistical Summaries of Selected Streamflow Data--South Platte River in Colorado and Nebraska; North Platte and Platte Rivers in Nebraska,
W81-01676 2E

NEOMYSIS
Selective Predation by Mysids inLake Restoration by Biomanipulation,
W81-01696 5A

NEW CASTLE COUNTY (DE)
Septic System Problems on an Urban Fringe,
W81-01836 5D

NEW JERSEY
Investigation of Acidity and Other Water-Quality Characteristics of Upper Oyster Creek, Ocean County, New Jersey,
W81-01665 5B

NEW YORK
The Volume of Sand and Gravel Resources in the Lower Bay of New York Harbor,
W81-01740 2J

Characteristics of the Groundwater Seepage into Great South Bay,
W81-01741 2F

Aging Urban Water Systems: A Computerized Case Study,
W81-01877 8A

NIDA RIVER (POLAND)
Chironomidae Communities of the River Nida and its Tributaries,
W81-01790 5C

NITRATES
Distribution of Nitrate in the Unsaturated Zone, Highland-East Highlands Area, San Bernardino County, California,
W81-01661 5A

Biological Denitrification in an Upflow Sludge Blanket Reactor,
W81-01858 5D

Resolution of an Industrial Waste Dilemma,
W81-01879 5C

NITRIFICATION
Single-Sludge Pure-Oxygen Nitrification and Phosphorus Removal,
W81-01834 5E

NITROGEN
Total Nitrogen Removal in a Multi-Channel Oxidation System,
W81-01816 5D

NITROGEN COMPOUNDS
A Comparison of the Characteristics of Soluble Organic Nitrogen in Untreated and Activated Sludge Treated Waste Waters,
W81-01862 5D

NITROGEN FERTILIZER
Spring Soil Water, Precipitation, and Nitrogen Fertilizer: Effect on Barley Yield,
W81-01783 3F

NITROGEN REMOVAL
Total Nitrogen Removal in a Multi-Channel Oxidation System,
W81-01816 5D

NITROGEN YIELD
Spring Soil Water, Precipitation, and Nitrogen Fertilizer: Effect of Barley Grain Protein Content and Nitrogen Yield,
W81-01784 3F

NON-POINT POLLUTION
Non-Point Source Pollution in Forest Streams of the Western Olympic Mountains,
W81-01695 5B

NORTH CAROLINA
Water Quality of the Neuse River, North Carolina--Variability, Pollution Loads, and Long-Term Trends,
W81-01668 5A

Rural Nonpoint Source Water Quality in a Southeastern Watershed,
W81-01804 5B

NORTH PLATTE RIVER (NE)
Statistical Summaries of Selected Streamflow Data--South Platte River in Colorado and Nebraska; North Platte and Platte Rivers in Nebraska,
W81-01676 2E

NORTHWEST FLORIDA
Water Resources Data for Florida, Water Year 1979--Volume 4. Northwest Florida.
W81-01679 7C

NUCLEAR POWERPLANTS
Effects of Heated Effluent on the Reproductive Biology of White Crappie, Pomoxis Annularis in Conowingo Pond, Pennsylvania,
W81-01833 5C

NUTRIENT REMOVAL
Nutrient Removal in Suspended Growth Systems Without Chemical Addition,
W81-01808 5D

Biological Denitrification in an Upflow Sludge Blanket Reactor,
W81-01858 5D

NUTRIENTS
Inorganic Phosphate Uptake in a Brackish Tropical Lagoon,
W81-01871 5C

ODOR
Finding the Right RX for Tastes and Odors,
W81-01894 5F

ODOR CONTROL
Bacteria Can Solve Malodours and Grease Problems in Treatment Plants.
W81-01849 5D

Controlling Taste and Odour Levels in Water,
W81-01850 5F

Designing for Force Main Odor Control,
W81-01891 5G

OIL POLLUTION
Abnormalities in the Tracheal Gills of Aquatic Insects Collected from Streams Receiving Chlorinated or Crude Oil Wastes,
W81-01869 5C

OIL WASTES
Powdered Versus Granular Carbon for Oil Refinery Waste Water Treatment,
W81-01825 5D

OILY WATER
Ultrafiltration or Reverse Osmosis Treatment of Emulsified Oil Metal Working Coolants,
W81-01723 5D

OPEN CHANNEL FLOW
Improved Implicit Procedure for Multichannel Surge Computations,
W81-01779 8B

OPERATING COSTS
An Economic Analysis of Effluent Standards for BOD, Ammonia, Total Suspended Solids, and Disinfection: Case Study of a Modern Treatment Plant,
W81-01701 5D

ORANGE COUNTY WATER DISTRICT (CA)
Cost of Water Reclamation by Advanced Waste Water Treatment,
W81-01829 5D

ORGANIC COMPOUNDS
Seasonal Variations in Trihalomethane Levels in an Iowa River Water Supply,
W81-01709 5B

Analysis of Trace Levels of Volatile Organic Contaminants in Municipal Drinking Water by Glass Capillary Gas Chromatography Using Simultaneous Flame Ionization and Electron Capture Detection,
W81-01768 5A

Removal of Organic Substances by Biologically Activated Carbon in a Fluidized-Bed Reactor,
W81-01817 5D

How to Conduct a GAC Organics Removal Pilot Study,
W81-01895 5F

ORGANIC LOADING
Carbon Adsorption Enhancement with Ozone,
W81-01799 5D

ORGANIC WASTES
Method and Apparatus for the Enhanced Treatment of Food Processing Waste Waters Using Aerobic Microorganisms,
W81-01722 5D

Bacteria Can Solve Malodours and Grease Problems in Treatment Plants.
W81-01849 5D

OROVILLE (CA)
Problems of Corrosion Control in Water Distribution Systems,
W81-01883 8A

OSAKA (JAPAN)
Design of Multistory Settling Tanks in Osaka,
W81-01797 8A

OUTFALL SEWERS
Marine Soft-Bottom Benthic Community Offshore from Black Rock Sewage Outfall, Connewarre, Victoria,
W81-01778 5C

Influence of a Submarine Municipal Outfall on Surrounding Benthic Ecosystem (Procchio, Isle of Elba, Italy),
W81-01803 5C

An Investigation of the Initial Dilution of Sewage Discharged through Submarine Diffusers,
W81-01810 5D

OVERFLOW
Optimal Control of Unsteady Combined Sewer Flow,
W81-01838 2E

Impact of Sediments on Dissolved Oxygen Concentrations Following Combined Sewer Overflows,
W81-01843 5B

OVERLAND FLOW
Design of an Overland Flow System,
W81-01815 5D

OXIDATION LAGOONS
Facultative Waste Stabilization Pond Design,
W81-01809 5D

Design of an Overland Flow System,
W81-01815 5D

Total Nitrogen Removal in a Multi-Channel Oxidation System,
W81-01816 5D

OZONE
Experiences in the Use of Ozone,
W81-01693 5F

Carbon Adsorption Enhancement with Ozone,
W81-01799 5D

A Quantitative Investigation of the Reaction of Ozone with p-Toluenesulfonic Acid in Aqueous Solution as a Model Compound for Anionic Detergents,
W81-01853 5D

PALO ALTO (CA)
Comparison of Chlorine Dioxide and Chlorine in Waste Water Disinfection,
W81-01792 5D

PATENTS
Sparged Air Distilled Water Recovery System,
W81-01712 3A

Process for Removing Sulfate Ions From Aqueous Streams,
W81-01713 5D

Bio-Surface Separation Process,
W81-01714 5D

Process for Treating Waste Water,
W81-01715 5D

Removing Metal Ions from Aqueous Effluents,
W81-01716 5D

Apparatus for Renovation of Sanitary Waters,
W81-01717 5D

Underdrain for Filter Tanks,
W81-01718 5G

Water Level Recorder,
W81-01719 7B

Self-Propelled Irrigation System,
W81-01720 3F

Shiftable Stator Sprinkler Head,
W81-01721 3F

Method and Apparatus for the Enhanced Treatment of Food Processing Waste Waters Using Aerobic Microorganisms,
W81-01722 5D

Ultrafiltration or Reverse Osmosis Treatment of Emulsified Oil Metal Working Coolants,
W81-01723 5D

Use of Nonstoichiometric Carbon-Sulfur Compounds to Remove Components from Liquids,
W81-01724 5G

Treating Pulp-and-Paper Mill Streams,
W81-01725 5D

Process for Removing Arsenic from Aqueous Mediums,
W81-01726 5D

Deposit Control Through the Use of Oligomeric Phosphonic Acid Derivatives,
W81-01727 5G

Aquatic Weed Cutter, De-Rooter and Harvester,
W81-01728 4A

Center Pivot Irrigation System With Slinger-Type Sprinkler Means,
W81-01729 3F

Process and Apparatus for the Thorough Purification of Water and the Highly Purified Water Obtained Thereby,
W81-01730 5F

Ion Exchange Process for Desalination,
W81-01731 3A

Process and Device for the Aeration of Waste Water,
W81-01732 5D

High-Efficient Activated Sludge Method,
W81-01733 5D

Process for Removing Oil Particles from Waste Water Containing the Same,
W81-01734 5D

Process and Device for the Purification of Waste Water by Means of Electroflotation,
W81-01735 5D

Backwash Water Recycling System,
W81-01736 3E

Apparatus for Purification of Waste Water by Means of Active Carbon,
W81-01737 5D

PATH OF POLLUTANTS
Quality of Water and Time of Travel in Yockanookany River, Choctaw County, Mississippi,
W81-01675 5B

Mathematical Model for Water Quality in Streams Impacted by Point and Nonpoint Source Pollution,
W81-01694 5B

Adsorption Mass Transfer Model for Virus Transport in Soils,
W81-01711 5B

Retention of Radionuclides by Mobile Humic Compounds and Soil Particles,
W81-01865 5B

Prediction of the Volatilization Rates of High-Volatility Chemicals from Natural Water Bodies,
W81-01899 5B

PERIPHYTON
Limnological Studies on Lake Pamvotis (Ioannina), Greece, I. Hydroclimatology, Phytoplankton-Periphyton with Special Reference to the Valency of Some Microorganisms from Sulphureta as Bioindicators,
W81-01789 2H

PESTICIDE DETECTION
Pesticides in the Rivers of the Kruger National Park (Plaagdoders in Rivierwater Van Die Nasionale Krugerwildtuin),
W81-01745 5A

PESTICIDE RESIDUES
Pesticides in the Rivers of the Kruger National Park (Plaagdoders in Rivierwater Van Die Nasionale Krugerwildtuin),
W81-01745 5A

PESTICIDES
Pesticides in the Rivers of the Kruger National Park (Plaagdoders in Rivierwater Van Die Nasionale Krugerwildtuin),
W81-01745 5A

PHENOLS
Kinetics of Phenol Degradation by Activated Sludge in a Continuous-Stirred Reactor,
W81-01786 5D

PHOSPHATES
Inorganic Phosphate Uptake in a Brackish Tropical Lagoon,
W81-01871 5C

PHOSPHORUS REMOVAL
Single-Sludge Pure-Oxygen Nitrification and Phosphorus Removal,
W81-01834 5E

PHYTOPLANKTON
Limnological Studies on Lake Pamvotis (Ioannina), Greece, I. Hydroclimatology, Phytoplankton-Periphyton with Special Reference to the Valency of Some Microorganisms from Sulphureta as Bioindicators,
W81-01789 2H

Production of Urea by Bacterial Decomposition of Organic Matter Including Phytoplankton,
W81-01866 5B

PILES (FOUNDATION)
Treatment Structure Support Over Difficult Soils,
W81-01880 8A

PILOT PLANTS
Nutrient Removal in Suspended Growth Systems Without Chemical Addition,
W81-01808 5D

Scaleup in Rotating Biological Contactor Design,
W81-01820 5D

How to Conduct a GAC Organics Removal Pilot Study,
W81-01895 5F

PIPELINES
Problems of Corrosion Control in Water Distribution Systems,
W81-01883 8A

PLANNING
Water Resources Planning using Computer Graphics,
W81-01841 6A

PLANT HISTORIES
Data Collection and Analysis of Commercial Membrane Desalination Plants--Volume I--Summary,
W81-01758 3A

Data Collection and Analysis of Commercial Membrane Desalination Plants--Volume II--Reverse Osmosis Plants,
W81-01759 3A

Data Collection and Analysis of Commercial Membrane Desalination Plants--Volume III--Electrodialysis/Electrodialysis Reversal Plants,
W81-01760 3A

POLIO VIRUSES
Poliovirus Retention in 75-CM Soil Cores After Sewage and Rainwater Application,
W81-01770 5B

POLLUTANT IDENTIFICATION
Salmonella Survival in Freshwater and Experimental Infections in Goldfish (Crassuis Auratus),
W81-01655 5A

Waste Water Spray Transport in Land Application,
W81-01761 5A

Analysis of Trace Levels of Volatile Organic Contaminants in Municipal Drinking Water by Glass Capillary Gas Chromatography Using Simultaneous Flame Ionization and Electron Capture Detection,
W81-01768 5A

Combined Membrane Filtration-Electrochemical Microbial Detection Method,
W81-01769 5A

Studies on the Toxicity of Pulp and Paper Mill Effluents-I. Mutagenicity of the Sediment Samples Derived from Kraft Paper Mills,
W81-01846 5A

Total Mercury and Methyl Mercury Levels in British Estuarine Sediments - II,
W81-01856 5A

Evaluation of the False-Positive Enteroviral Plaque Phenomenon Occurring in Sewage Samples,
W81-01857 5A

Effectiveness of the Organic Flocculation Method in Concentrating Echovirus 7 and Coxsackievirus A9 from Water,
W81-01860 5A

POLLUTANTS
Sources of Toxic Compounds in Household Wastewater,
W81-01683 5B

POLLUTION ABATEMENT
Chironomid Farming-A Means of Recycling Farm Manure and Potentially Reducing Water Pollution in Hong Kong,

RIVER FLOW
River Management in the Urban Environment,
W81-01748 4C

RIVERS
Chironomidae Communities of the River Nida and its Tributaries,
W81-01790 5C

Wave Influences on River-Mouth Depositional Process: Examples from Australia and Papua New Guinea,
W81-01872 2L

Difference in the Composition of Linear Alkylbenzene Sulfonate Homologues in River Sediment and River Water,
W81-01875 5B

ROCKY MOUNTAIN REGION
Empirical Application of a Model for Estimating the Recreation Value of Water in Reservoirs Compared to Instream Flow,
W81-01752 6B

RUNOFF
Agricultural Runoff During a Drought Period,
W81-01788 2E

Rural Nonpoint Source Water Quality in a Southeastern Watershed,
W81-01804 5B

RUNOFF ABATEMENT
Urban Runoff Management Strategies,
W81-01658 4C

RURAL AREAS
Evaluation of 19 On-Site Waste Treatment Systems in Southeastern Kentucky,
W81-01681 5D

Engineering Analysis of the Cost/Benefit Relationship for Rural Water Supply Treatment Systems,
W81-01691 5F

Rural Nonpoint Source Water Quality in a Southeastern Watershed,
W81-01804 5B

SAFETY FACTORS
Predicting Safe Concentrations of Volatile Organic Substances in Discharges to Sewers,
W81-01689 5A

SALINITY
A Mathematical Model of the Koksoak River. (Modele Mathematique De La Riviere Koksoak),
W81-01781 2L

Comparison of Methods for Analysis of the Transverse and Vertical Circulation Contributions to the Longitudinal Advective Salt Flux in Estuaries,
W81-01864 2L

SALMONELLA
Salmonella Survival in Freshwater and Experimental Infections in Goldfish (Crassuis Auratus),
W81-01655 5A

Effects of Residence in Fishes Upon the Pathogenicity of Salmonella Serotypes for Laboratory White Mice,
W81-01657 5A

Transmission of Various Salmonellae Among Fish (Crassius Autatus) in the Aquatic Environment,
W81-01692 5C

Indicator Bacteria and Salmonella in Food-Processing and Domestic Effluent,
W81-01802 5D

SALT
City Examines Effects of Road Salting on its Water Supply,
W81-01878 5B

SALT MARSHES
An Evaluation of Lime Treatment and Sand Drying Beds for Upgrading Stabilization Pond Effluent,
W81-01653 5C

SAMPLING
Pesticides in the Rivers of the Kruger National Park (Plaagdoders in Rivierwater Van Die Nasionale Krugerwildtuin),
W81-01745 5A

SAN BERNARDINO COUNTY (CA)
Distribution of Nitrate in the Unsaturated Zone, Highland-East Highlands Area, San Bernardino County, California,
W81-01661 5A

SANDS
The Volume of Sand and Gravel Resources in the Lower Bay of New York Harbor,
W81-01740 2J

SASKATCHEWAN
Detailed Surface Water Quality Data, Saskatchewan, 1974-1976.
W81-01702 5A

SATELLITES (ARTIFICIAL)
Satellites as Aid to Water Resource Managers,
W81-01840 7B

SEA WATER
The Effects of Light on the Dissipation of Chlorine in Sea-Water,
W81-01690 5B

SEDIMENT CONTROL
Detention Basin Settleability of Urban Runoff Pollution Phase II,
W81-01756 5G

SEDIMENT TRANSPORT
Wave Influences on River-Mouth Depositional Process: Examples from Australia and Papua New Guinea,
W81-01872 2L

SEDIMENTS
The Volume of Sand and Gravel Resources in the Lower Bay of New York Harbor,
W81-01740 2J

Effects of Adaptation on Biodegradation Rates in Sediment/Water Cores from Estuarine and Freshwater Environments,
W81-01772 5B

Impact of Sediments on Dissolved Oxygen Concentrations Following Combined Sewer Overflows,
W81-01843 5B

Difference in the Composition of Linear Alkylbenzene Sulfonate Homologues in River Sediment and River Water,
W81-01875 5B

SEEPAGE
Characteristics of the Groundwater Seepage into Great South Bay,
W81-01741 2F

SELENIUM PHOTOCELLS
A Simple and Inexpensive 4-PI Light Collector and Two Designs for a Light Meter for Light Attenuation Studies,
W81-01873 7B

SEPARATION TECHNIQUES
Process for Removing Sulfate Ions From Aqueous Streams,
W81-01713 5D

Bio-Surface Separation Process,
W81-01714 5D

Process for Treating Waste Water,
W81-01715 5D

Removing Metal Ions from Aqueous Effluents,
W81-01716 5D

Use of Nonstoichiometric Carbon-Sulfur Compounds to Remove Components from Liquids,
W81-01724 5G

Process for Removing Oil Particles from Waste Water Containing the Same,
W81-01734 5D

Process and Device for the Purification of Waste Water by Means of Electroflotation,
W81-01735 5D

SEPTIC TANKS
Effect of Precipitation and Evapotranspiration of a Septic Tank-Sand Filter Disposal System,
W81-01800 5D

SEPTIC TANKS

Design of an Overland Flow System,
W81-01815 5D

On-Site Waste Water Treatment on Problem Soils,
W81-01824 5D

Septic System Problems on an Urban Fringe,
W81-01836 5D

SETTEABILITY OF POLLUTANTS
Detention Basin Settleability of Urban Runoff Pollution Phase II,
W81-01756 5G

SETTLING TANKS
Design of Multistory Settling Tanks in Osaka,
W81-01797 8A

SETTLING VELOCITY
Settling Properties of Extended Aeration Sludge,
W81-01813 5E

SEWAGE
Influence of a Submarine Municipal Outfall on Surrounding Benthic Ecosystem (Procchio, Isle of Elba, Italy),
W81-01803 5C

SEWAGE BACTERIA
Salmonella Survival in Freshwater and Experimental Infections in Goldfish (Crassuis Auratus),
W81-01655 5A

Quantitative Studies on a Human Pathogen (Candida Albicans) and Traditional Bacterial Indicators of Pollution in Domestic Waste Waters and Receiving Waters,
W81-01762 5A

The Inactivation of Faecal Coliforms and Ascaris Ova in Faeces by Lime,
W81-01855 5D

SEWAGE DISPOSAL
Evaluation of 19 On-Site Waste Treatment Systems in Southeastern Kentucky,
W81-01681 5D

SEWAGE TREATMENT
Evaluation of 19 On-Site Waste Treatment Systems in Southeastern Kentucky,
W81-01681 5D

Bio-Surface Separation Process,
W81-01714 5D

Quantitative Studies on a Human Pathogen (Candida Albicans) and Traditional Bacterial Indicators of Pollution in Domestic Waste Waters and Receiving Waters,
W81-01762 5A

Solids Separation in Activated Sludge System Design and Operation,
W81-01793 5D

Bacteria Can Solve Malodours and Grease Problems in Treatment Plants.
W81-01849 5D

Alberta Environment Minister Foresees Many Challenges for Province in the '80's.
W81-01851 6E

The Influence of Sludge Age on Heavy Metal Removal in the Activated Sludge Process,
W81-01854 5D

Drainage Basin Contamination Prompts Regional Planning,
W81-01889 5D

SEWERAGE
Waste Water Treatment Works in Japan: Status and Outlook,
W81-01826 5D

SEWERS
Predicting Safe Concentrations of Volatile Organic Substances in Discharges to Sewers,
W81-01689 5A

Sewer Construction by Shield Method in Yokohama,
W81-01766 8A

Optimal Control of Unsteady Combined Sewer Flow,
W81-01838 2E

SHOALHAVEN RIVER (AUSTRALIA)
Wave Influences on River-Mouth Depositional Process: Examples from Australia and Papua New Guinea,
W81-01872 2L

SKIMMING
Resolution of an Industrial Waste Dilemma,
W81-01879 5C

SLUDGE
Settling Properties of Extended Aeration Sludge,
W81-01813 5E

Anaerobic Toxicity Evaluation by Batch and Semi-Continuous Assays,
W81-01827 5D

Resolution of an Industrial Waste Dilemma,
W81-01879 5C

Revegetation of Mined Land Using Waste Water Sludge,
W81-01885 4D

Revegetation Project Utilizes Sludge,
W81-01886 4D

Sludge Dewatering Plant Uses Programmable Controllers.
W81-01896 6D

SLUDGE DISPOSAL
Energy Autonomy in the Waste Water Treatment Process,
W81-01818 5E

Solids Handling Systems for Six Different Disposal Options,
W81-01830 5E

Composting and Disposal of Industrial Waste Water Sludge,
W81-01842 5E

Developing a Cost-Effective Sludge Management Approach,
W81-01888 5E

Codisposal of Refuse and Sludge,
W81-01893 5E

SLUDGE TREATMENT
Enterovirus and Coliphage Inactivation During Activated Sludge Treatment,
W81-01708 5D

Engineering Evaluation of New Sludge Treatment Facilities,
W81-01796 5E

Autoheated Aerobic Thermophilic Digestion With Aeration,
W81-01812 5D

Alternative Fuels for Multiple-Hearth Furnaces,
W81-01832 5E

Single-Sludge Pure-Oxygen Nitrification and Phosphorus Removal,
W81-01834 5E

Composting and Disposal of Industrial Waste Water Sludge,
W81-01842 5E

Biological Denitrification in an Upflow Sludge Blanket Reactor,
W81-01858 5D

Sludge Dewatering Plant Uses Programmable Controllers.
W81-01896 6D

SOIL CONTAMINATION
Poliovirus Retention in 75-CM Soil Cores After Sewage and Rainwater Application,
W81-01770 5B

SOIL DISPOSAL FIELDS
Composting and Disposal of Industrial Waste Water Sludge,
W81-01842 5E

SOIL ENGINEERING
Treatment Structure Support Over Difficult Soils,
W81-01880 8A

SOIL PROPERTIES
Effects of Environmental Variables and Soil Characteristics on Virus Survival in Soil,
W81-01771 5B

SOIL STRENGTH
Sewer Construction by Shield Method in Yokohama,
W81-01766 8A

SOIL TEXTURE
The Variation of in Situ Measured Soil Water Properties Within Soil Map Units,
W81-01782 2G

SOIL TYPES
On-Site Waste Water Treatment on Problem Soils,
W81-01824 5D

SOIL WATER
The Variation of in Situ Measured Soil Water Properties Within Soil Map Units,
W81-01782 2G

Spring Soil Water, Precipitation, and Nitrogen Fertilizer: Effect on Barley Yield,
W81-01783 3F

Spring Soil Water, Precipitation, and Nitrogen Fertilizer: Effect of Barley Grain Protein Content and Nitrogen Yield,
W81-01784 3F

SOIL WATER MOVEMENT
Modeling Infiltration,
W81-01847 2G

SOLID WASTE DISPOSAL
Solids Handling Systems for Six Different Disposal Options,
W81-01830 5E

SOLID WASTES
State/EPA Agreement, FY 81.
W81-01743 6E

SOUTH AFRICA
Pesticides in the Rivers of the Kruger National Park (Plaagdoders in Rivierwater Van Die Nasionale Krugerwildtuin),
W81-01745 5A

Resisting the Drought,
W81-01749 2E

Drought and Our Destiny,
W81-01750 2B

SOUTH ARKANSAS
Water-Resources Appraisal of the South-Arkansas Lignite Area,
W81-01674 5G

SOUTH PLATTE RIVER (CO)
Hydrologic Analysis of the Proposed Badger-Beaver Creeks Artificial Recharge Project, Morgan County, Colorado,
W81-01670 6A

SOUTH PLATTE RIVER (CO-NE)
Statistical Summaries of Selected Streamflow Data--South Platte River in Colorado and Nebraska; North Platte and Platte Rivers in Nebraska,
W81-01676 2E

SOUTHEASTERN MONTANA
Sulfate Reduction in Ground Water of Southeastern Montana,
W81-01662 5A

SPECTROPHOTOMETRY
The Effect of Surfactants on the Mixed Chelate Extraction-Atomic Absorption Spectrophotometric Determination of Copper, Nickel, Iron, Cobalt, Cadmium, Zinc and Lead,
W81-01859 5A

SPHAGNUM
Evaporation from a Sphagnum Moss Surface,
W81-01738 2D

SPRAY IRRIGATION
Waste Water Spray Transport in Land Application,
W81-01761 5A

SPRINKLER IRRIGATION
Shiftable Stator Sprinkler Head,
W81-01721 3F

Center Pivot Irrigation System With Slinger-Type Sprinkler Means,
W81-01729 3F

STANDARDS
Water Pollution Control in Japan,
W81-01794 6E

STOCK WATER
Winter Ice Removal from Stock Water Ponds,
W81-01651 8C

Investigations of Small, Man-Made Impoundments on the Hydrology of the Lower Oak Creek Drainage Area, Coconino and Yavapai Counties, Arizona,
W81-01754 4A

STORM RUNOFF
Dissolved Oxygen Measurements in Ohio Streams Following Urban Runoff,
W81-01684 5B

Mathematical Model for Water Quality in Streams Impacted by Point and Nonpoint Source Pollution,
W81-01694 5B

Detention Basin Settleability of Urban Runoff Pollution Phase II,
W81-01756 5G

Optimal Control of Unsteady Combined Sewer Flow,
W81-01838 2E

STORM WATER
Observations on Kinematic Response in Urban Runoff Models,
W81-01659 4C

STORM WATER MANAGEMENT
Detention Basin Settleability of Urban Runoff Pollution Phase II,
W81-01756 5G

STREAMFLOW
Flow Characteristics of New Mexico Streams, Part I. Flow Duration,
W81-01667 2E

Quality of Water and Time of Travel in Yockanookany River, Choctaw County, Mississippi,
W81-01675 5B

Statistical Summaries of Selected Streamflow Data--South Platte River in Colorado and Nebraska; North Platte and Platte Rivers in Nebraska,
W81-01676 2E

Mathematical Model for Water Quality in Streams Impacted by Point and Nonpoint Source Pollution,
W81-01694 5B

Empirical Application of a Model for Estimating the Recreation Value of Water in Reservoirs Compared to Instream Flow,
W81-01752 6B

Evaluation of Mangement Practices on the Biological and Chemical Characteristics of Streamflow from Forested Watersheds,
W81-01763 4C

STREAMS
Flow Characteristics of New Mexico Streams, Part I. Flow Duration,
W81-01667 2E

STRIP MINES
Revegetation of Mined Land Using Waste Water Sludge,
W81-01885 4D

SUBSURFACE WATERS
A Subsurface Water Quality Model for Western Surface Mine Sites,
W81-01751 5B

SULFATE-REDUCING BACTERIA
Sulfate Reduction in Ground Water of Southeastern Montana,
W81-01662 5A

SULFUR BACTERIA
Sulfate Reduction in Ground Water of Southeastern Montana,
W81-01662 5A

SUNFISHES
Effects of Heated Effluent on the Reproductive Biology of White Crappie, Pomoxis Annularis in Conowingo Pond, Pennsylvania,
W81-01833 5C

SURFACE-GROUNDWATER RELATIONSHIPS
Water Resources of the Cook Inlet Basin, Alaska,
W81-01671 7C

SURFACE WATERS
Investigation of Acidity and Other Water-Quality Characteristics of Upper Oyster Creek, Ocean County, New Jersey,
W81-01665 5B

Summary of Water-Level and Discharge Records for the East Everglades Area, Dade County, Florida,
W81-01673 7C

Water Resources Data for Alaska, Water Year 1979.
W81-01677 7C

Water Resources Data for Arkansas, Water Year 1979.
W81-01678 7C

Water Resources Data for Florida, Water Year 1979--Volume 4. Northwest Florida.
W81-01679 7C

Detailed Surface Water Quality Data, Saskatchewan, 1974-1976.
W81-01702 5A

Detailed Surface Water Quality Data, Alberta, 1974-1976.
W81-01703 5A

SURFACTANTS
A Quantitative Investigation of the Reaction of Ozone with p-Toluenesulfonic Acid in Aqueous Solution as a Model Compound for Anionic Detergents,
W81-01853 5D

The Effect of Surfactants on the Mixed Chelate Extraction-Atomic Absorption Spectrophotometric Determination of Copper, Nickel, Iron, Cobalt, Cadmium, Zinc and Lead,
W81-01859 5A

SURREY LAKE (IN)
Environmental Control of Pithophora Oedogonia (Chlorophyceae) Akinete Germination,
W81-01699 5C

SUSPENDED SOLIDS
Control of Aerobic Digestion by Substrate Concentration,
W81-01787 5D

Solids Separation in Activated Sludge System Design and Operation,
W81-01793 5D

Settling Properties of Extended Aeration Sludge,
W81-01813 5E

SWEDEN
Liming Acid Lakes in Sweden,
W81-01814 5G

TAILRACE
Improved Implicit Procedure for Multichannel Surge Computations,
W81-01779 8B

TAMA RIVER (JAPAN)
Difference in the Composition of Linear Alkylbenzene Sulfonate Homologues in River Sediment and River Water,
W81-01875 5B

TASTE
Controlling Taste and Odour Levels in Water,
W81-01850 5F

Finding the Right RX for Tastes and Odors,
W81-01894 5F

TEMPERATURE DISTRIBUTION
Heat Transfer in Irradiated Shallow Layers of Water,
W81-01697 2H

TENNESSEE
Trihalomethanes: Impact of Bromide Ion Concentration on Yield, Species Distribution, Rate of Formation and Influence of Other Variables,
W81-01656 5B

TEXAS
Water Use, Projected Water Requirements, and Related Data and Information for the Standard Metropolitan Statistical Areas in Texas.
W81-01742 6B

THAILAND
The Inactivation of Faecal Coliforms and Ascaris Ova in Faeces by Lime,
W81-01855 5D

THERMAL POLLUTION
Effects of Heated Effluent on the Reproductive Biology of White Crappie, Pomoxis Annularis in Conowingo Pond, Pennsylvania,
W81-01833 5C

THERMAL STRATIFICATION
Heat Transfer in Irradiated Shallow Layers of Water,
W81-01697 2H

TIGRIS RIVER (IRAQ)
Potential of Tube Settlers in Removing Raw Water Turbidity Prior to Coagulation,
W81-01775 5F

TOXICITY
Predicting Safe Concentrations of Volatile Organic Substances in Discharges to Sewers,
W81-01689 5A

Studies on the Toxicity of Pulp and Paper Mill Effluents-I. Mutagenicity of the Sediment Samples Derived from Kraft Paper Mills,
W81-01846 5A

Toxicities of Microcystis Aeruginosa Collected from Some Lakes, Reservoirs, Ponds and Moat in Tokyo and Adjacent Regions,
W81-01876 5C

TOXICOLOGY
Application of an Evaporative Loss Model to Estimate the Persistence of Contaminants in Lentic Environments,
W81-01698 5A

TOXINS
Health Considerations in the Preparation of Drinking Water from the River Rhine,
W81-01753 5C

Automatic Water Quality Analyzers for Waste Water Collection and Treatment,
W81-01798 5A

Cyanide Problems in Municipal Waste Water Treatment Plants,
W81-01819 5B

Anaerobic Toxicity Evaluation by Batch and Semi-Continuous Assays,
W81-01827 5D

Toxicity of Landfill Leachates,
W81-01828 5C

Toxic Inhibition of Anaerobic Biodegration,
W81-01845 5D

TRACE ELEMENTS
The Effect of Surfactants on the Mixed Chelate Extraction-Atomic Absorption Spectrophotometric Determination of Copper, Nickel, Iron, Cobalt, Cadmium, Zinc and Lead,
W81-01859 5A

TRANSKEI (AFRICA)
Ecology of Southern African Estuaries. Part XI. Mngazana: A Mangrove Esturary in Transkei,
W81-01744 2L

TREATMENT FACILITIES
An Economic Analysis of Effluent Standards for BOD, Ammonia, Total Suspended Solids, and Disinfection: Case Study of a Modern Treatment Plant,
W81-01701 5D

Supervision and Control System at the Kanagawa Waste Water Treatment Plant, Yokohama,
W81-01765 5D

Unique Design Features of Kobe's Waste Water Treatment Plant,
W81-01795 8A

Engineering Evaluation of New Sludge Treatment Facilities,
W81-01796 5E

Energy Autonomy in the Waste Water Treatment Process,
W81-01818 5E

Scaleup in Rotating Biological Contactor Design,
W81-01820 5D

Current Status of Water Reclamation at Windhoek,
W81-01822 5D

Cost of Water Reclamation by Advanced Waste Water Treatment,
W81-01829 5D

Effects of Water Conservation on Municipal Waste Water Treatment Facilities,
W81-01831 5D

Drainage Basin Contamination Prompts Regional Planning,
W81-01889 5D

TRIHALOMETHANE
Seasonal Variations in Trihalomethane Levels in an Iowa River Water Supply,
W81-01709 5B

TRIHALOMETHANES
Trihalomethanes: Impact of Bromide Ion Concentration on Yield, Species Distribution, Rate of Formation and Influence of Other Variables,
W81-01656 5B

Water Quality Improvement Program,
W81-01890 5F

TRINIDAD
The Trinidad Water Projects,
W81-01892 8A

TUBE SETTLERS
Potential of Tube Settlers in Removing Raw Water Turbidity Prior to Coagulation,
W81-01775 5F

TURBIDITY
Potential of Tube Settlers in Removing Raw Water Turbidity Prior to Coagulation,
W81-01775 5F

ULTIMATE DISPOSAL
Developing a Cost-Effective Sludge Management Approach,
W81-01888 5E

UNITED KINGDOM
Experiences in the Use of Ozone,
W81-01693 5F

UPSTREAM CONTROL
Urban Runoff Management Strategies,
W81-01658 4C

URBAN RUNOFF
Urban Runoff Management Strategies,
W81-01658 4C

Observations on Kinematic Response in Urban Runoff Models,
W81-01659 4C

Dissolved Oxygen Measurements in Ohio Streams Following Urban Runoff,
W81-01684 5B

Water Quality and Biological Effects of Urban Runoff on Coyote Creek; Phase I - Preliminary Survey,
W81-01687 5C

River Management in the Urban Environment,
W81-01748 4C

City Examines Effects of Road Salting on its Water Supply,
W81-01878 5B

URBANIZATION
Ground Water in the Thousand Oaks Area, Ventura County, California,
W81-01669 4B

Maximum Utilization of Water Resources in a Planned Community; Eutrophication Potential of Surface Waters in a Developing Watershed,
W81-01685 5C

River Management in the Urban Environment,
W81-01748 4C

Septic System Problems on an Urban Fringe,
W81-01836 5D

UREA
Production of Urea by Bacterial Decomposition of Organic Matter Including Phytoplankton,
W81-01866 5B

UTILITIES
Treated Water Demand and the Economics of Regionalization; Volume 2, Economics of Regionalization: The Electric Power Example,
W81-01680 6C

Development and Application of a Water Supply Cost Analysis System; Volume I,
W81-01682 6C

VAPOR PRESSURE
Predicting Safe Concentrations of Volatile Organic Substances in Discharges to Sewers,
W81-01689 5A

VARIABLE COSTS
An Economic Analysis of Effluent Standards for BOD, Ammonia, Total Suspended Solids, and Disinfection: Case Study of a Modern Treatment Plant,
W81-01701 5D

VEGETATION
Cadmium in Forest Ecosystems,
W81-01654 5C

VENTILATION
Recent Concepts and Development of an Automated Biological Monitoring System,
W81-01844 5A

VIRUSES
Enterovirus and Coliphage Inactivation During Activated Sludge Treatment,
W81-01708 5D

Capacity of Activated Sludge Solids for Virus Adsorption,
W81-01710 5D

Adsorption Mass Transfer Model for Virus Transport in Soils,
W81-01711 5B

Poliovirus Retention in 75-CM Soil Cores After Sewage and Rainwater Application,
W81-01770 5B

Effects of Environmental Variables and Soil Characteristics on Virus Survival in Soil,
W81-01771 5B

Evaluation of the False-Positive Enteroviral Plaque Phenomenon Occurring in Sewage Samples,
W81-01857 5A

Effectiveness of the Organic Flocculation Method in Concentrating Echovirus 7 and Coxsackievirus A9 from Water,
W81-01860 5A

VOLATILIZATION
Prediction of the Volatilization Rates of High-Volatility Chemicals from Natural Water Bodies,
W81-01899 5B

WASHINGTON
Non-Point Source Pollution in Forest Streams of the Western Olympic Mountains,
W81-01695 5B

State/EPA Agreement, FY 81.
W81-01743 6E

WASTE DILUTION
An Investigation of the Initial Dilution of Sewage Discharged through Submarine Diffusers,
W81-01810 5D

WASTE DISPOSAL
Handling of Combustion and Emission-Abatement Wastes From Coal-Fired Power Plants: Implications for Fish and Wildlife Resources,
W81-01688 5C

Aquaculture in South East Asia: Some Points of Emphasis,

SELECTED WATER RESOURCES ABSTRACTS

DEPOSITORY
AUG 13 1981
UNIVERSITY OF ILLINOIS
AT URBANA-CHAMPAIGN

VOLUME 14, NUMBER 11
JUNE 1, 1981

W81-01901 -- W81-02150
CODEN: SWRABW

SELECTED WATER RESOURCES ABSTRACTS (SWRA) is produced by the Office of Water Research and Technology, U.S. Department of the Interior, and published twice monthly by the National Technical Information Service (NTIS), U.S. Department of Commerce.

SWRA is available to Federal agencies and their contractors or grantees in water resources research upon request, citing contract or grant number and sponsoring agency. Write: Office of Water Research and Technology, U.S. Department of the Interior, Washington, DC 20240. The **SWRA Journal** is also available on subscription from NTIS, 5285 Port Royal Road, Springfield, VA 22161. Annual subscription rates for the North American Continent are: Journal only, $100; Journal and Annual Indexes, $125; Indexes only, $50. Other addressees, write for prices.

Some documents abstracted in this journal can be purchased from NTIS. Price codes are given in the entries and a current code-price conversion table is printed on the outside back cover. Other documents are available from originating organizations or authors as indicated in the citation.

SELECTED WATER RESOURCES ABSTRACTS

A semimonthly publication of the Office of Water Research and Technology,
U.S. Department of the Interior

VOLUME 14, NUMBER 11
JUNE 1, 1981

W81-01901 -- W81-02150

The Secretary of the Interior has determined that the publication of the periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1983.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

PREFACE

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. These documents cover water resources as treated in the life, physical, and social sciences and the related engineering and legal aspects of the characteristics, supply condition, conservation, control, use, or management of water resources. Each abstract includes a full bibliographic citation and a set of descriptors which are listed in the **Water Resources Thesaurus.** The abstract entries are classified into 10 fields and 60 groups similar to the water resources research categories established by the Committee on Water Resources Research of the then Federal Council for Science and Technology.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several services of the Office of Water Research and Technology. The cumlative SWRA file from 1968 and monthly updates are available also in magnetic tape through lease from NTIS.

THE OFFICE OF WATER RESEARCH AND TECHNOLOGY DOES NOT PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Comments and suggestions concerning the contents and arrangement of this bulletin are welcome.

Office of Water Research and Technology
U.S. Department of the Interior
Washington, D.C. 20240

CONTENTS

SUBJECT FIELDS AND GROUPS

Please use the edge index on the back cover to locate Subject Fields and Indexes.

01 NATURE OF WATER

Includes the following Groups: Properties; Aqueous Solutions and Suspensions.

02 WATER CYCLE

Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION

Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL

Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Nonwater Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION

Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING

Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA

Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS

KINEMATIC DESIGN STORMS INCORPORATING SPATIAL AND TIME AVERAGING,
McMaster Univ., Hamilton (Ontario). Dept. of Civil Engineering and Engineering Mechanics.
W. James, and J. J. Drake.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-173858, Price codes: A11 in paper copy, A01 in microfiche.
In: Proceedings, Stormwater Management Model (SWMM) Users Group Meeting, 19-20 June, 1980, Toronto, Ontario, Environmental Protection Agency EPA 600/9-80-064, December, 1980, p 133-149. 7 Fig, 1 Tab, 19 Ref.

Descriptors: *Design storms, *Rainfall-runoff relationships, *Model studies, Storm runoff, Urban runoff, Storm water, *Water pollution, Hydrographs, Distribution patterns, Rainfall intensity.

Traditionally, design storms have been developed from statistical analysis of point rainfall records that include all types of rainstorms. The resultant rain distributions are unlike any type of observed rain storm. This synthetic temporal distribution is typically applied uniformly across the catchment and flow hydrographs are also unlike observed runoff hydrographs. The storm model presented in this study is based on the synoptic observations of rain cells reported in weather radar literature. The model generates hydrographs for each subcatchment, thus simulating the spatial and temporal growth and decay of a system of storm cells as they move across an urban catchment system. Intensity-duration-frequency curves obtained from the model are similar to those derived statistically from the long-term rainfall record. The model is applied to catchments in the Hamilton area in South Ontario, Canada. Results indicate that storm cell kinematics are significant, particularly in peak runoff estimates for drainage design and water pollutant loading estimates, because of the sensitivity of the time to peak and rate of rise of hydrographs and pollutographs. Such storm models appear to be useful for computer based rainfall-runoff studies. (Moore-SRC)

SPATIAL AND SEASONAL PRECIPITATION DISTRIBUTION IN SOUTHWEST IDAHO,
Science and Education Administration, Boise, ID.
C. L. Hanson, R. P. Morris, R. L. Engleman, D. L. Coon, and C. W. Johnson.
Science and Education Administration, Oakland, California, Agricultural Reviews and Manuals ARM-W-13, April, 1980. 15 p, 7 Fig, 5 Tab, 12 Ref.

Descriptors: *Idaho, *Precipitation(Atmospheric), *Distribution patterns, *Elevation, Spatial distribution, Temporal distribution, Seasonal, Storms, Mountains, Precipitation gages, Time, Hydrology, Watersheds(Basins).

Analysis of the 16 year record from the precipitation gage network on the Reynolds Creek Experimental Watershed in southwest Idaho shows that the average annual precipitation ranged from 250 mm on the low elevation (1100 m) areas of the watershed to 1100 mm on the high elevation (2160 m) areas. There was a linear relationship between summer (May through October) precipitation and elevation and winter (November through April) precipitation and elevation. July and August storm durations averaged about 3.6 hr at both the low and high elevations. December and January storms averaged 5.2 hr duration at the low elevations and 8.6 hr at the high elevations. The average interval between storms during July and August was 7.7 days at the low elevation site and 6.6 days at the high elevation site. The average interval between storms during December and January was 2.9 days at the low elevations and 1.7 days at the high elevations. At all elevations, the interval between storms was longer for the two summer months than for the two winter months. The 2-yr 6-hr precipitation at the low elevations was 20 mm. The 2-yr 6-hr precipitation at the high elevations was about 40 mm. These analyses show precipitation characteristics of a mountainous area from a dense precipitation gage network and provide data for hydrologic modeling and resource inventory evaluation. (Moore-SRC)

MODEL OF TIME AND SPACE DISTRIBUTION OF RAINFALL IN ARIZONA AND NEW MEXICO,
Science and Education Administration, Tucson, AZ. Southwest Rangeland Watershed Research Center.
H. B. Osborn, E. D. Shirley, D. R. Davis, and R. B. Koehler.
Science and Education Administration, Oakland, California, Agricultural Reviews and Manuals ARM-W-14, May, 1980. 31 p, 14 Fig, 6 Tab, 10 Ref, 1 Append.

Descriptors: *Rainfall disposition, *New Mexico, *Arizona, *Model studies, *Simulated rainfall, Watersheds(Basins), Hydrology, Range management, Rain gages, Depth-area-duration analysis, Distribution patterns, Runoff forecasting, Time, Isohyets, Mapping.

Rainfall data from two dense rain gage networks, several small groups of rain gages, and National Weather Service rain gages are used to describe the occurrence and depth-area distribution of rainfall and to develop a rainfall simulation program (model) for Arizona and New Mexico. Depth-area rainfall distribution is described by an assumed cellular thunderstorm structure, with verification limited to comparison of simulated and actual total rainfall patterns. Simulated rainfall is convenient to use in hydrologic models when long term rainfall records are unavailable. If point records are available, they can be used to verify the model. The program output includes accumulated seasonal rainfall for any designated point (gage), point totals for individual events for isohyetal mapping, starting and ending times for all events, and Thiessen weighted watershed averages. The output can be used directly to estimate peaks and volumes of runoff for very small watersheds (up to 100 hectares), and indirectly for larger watersheds with appropriate routing methods. Since the rainfall is distributed both in time and space, simulations of several years of record could be used to provide probabilities of wet and dry sequences to evaluate the chances of success for range renovation programs and could aid ranchers in overall planning of range management programs. THE DISTRIBUTION OF KINETIC ENERGY OF RAINFALL IN SOUTH AFRICA - A FIRST ASSESSMENT,
Natal Univ., Pietermaritzburg (South Africa). Dept. of Agricultural Engineering.
R. E. Schulze.
Water SA, Vol 6, No 2, p 49-58, April, 1980. 6 Fig, 1 Tab, 18 Ref.

Descriptors: *Erosion, *Rain, *Kinetics, Energy, Africa, Weathering, Impact(Rainfall), Precipitation(Atmospheric), South Africa.

Rainfall kinetic energies were derived from records of rainfall intensity measured at 14 stations located in a variety of rainfall regions in South Africa. The generalized relationship between kinetic energy (E) and rainfall intensity (I) is established at the monthly level of data using the Soil Loss Estimation Model for Southern Africa (SLEMSA) equation for E, and from these, mean annual, summer and winter distributions of E are mapped for the republic. In order to relate studies of soil erosion to rainfall, the intensity, size distribution, fall velocity and angle of impact of the raindrops must be known. The rainfall intensity is comparatively easily measured, and relationships between the energy and the intensity have been sought. Studies are currently being conducted on physically based soil loss models. As information is generally lacking concerning the magnitudes and patterns of rainfall energy in South Africa, efforts are underway to determine regional rainfall energy equations and map distributions of E. (Baker-FRC)

A DEPTH-AREA-DURATION MODEL OF STORM RAINFALL IN THE SOUTHERN GREAT PLAINS,
Science and Education Adminstration, Chickasha, OK.
A. D. Nicks, and F. A. Igo.
Water Resources Research, Vol 16, No 5, p 939-945, October, 1980. 8 Fig, 14 Ref.

Descriptors: *Depth-area-duration analysis, Storms, *Runoff forecasting, *Rainstorms, Hyetographs, Depth-area curves, Mathematical models, Least squares method, Great Plains, *Oklahoma, Rainfall-runoff relationships.

A depth-area-duration model for Oklahoma rainstorms was developed using 10 years of data from a dense network of recording rain gages spaced on a 5 by 5 km grid. The model relates mean depth of rainfall over a given area to storm center rainfall depth. Nonlinear least squares optimization was used to fit the data from 138 storms to the model. The model was tested using storm isohyetal maps available from published storm reports. In one case, the model simulation of the depth-area curve underestimated the actual depth by 23% at 777 sq km. This result was within the error found from network data tested with the model: mean errors ranged from 8% on 130 sq km to 27% on 3100 sq km. The model can be used to convert storm center point rainfall amounts to mean rainfall in areas up to 3100 sq km. The model seems to have predictive value, especially for storms which occur in the Great Plains area. (Small-FRC)

2C. Snow, Ice, and Frost

A MODEL FOR THE PREDICTION OF ICE LENSING AND FROST HEAVE IN SOILS,
Alberta Univ., Edmonton. Dept. of Mechanical Engineering.
R. R. Gilpin.
Water Resources Research, Vol 16, No 5, p 918-930, October, 1980. 11 Fig, 18 Ref.

Descriptors: *Frost heaving, *Physical models, Ice, *Soil properties, *Ice lenses, Thermal conductivity, Hydraulic properties, Water properties, Model studies.

A physical model based on the freezing of a saturated matrix of uniform spheres exhibited many of the characteristics observed in the frost heave of soils. If the radius of the spheres is equal to the radius of the finest 10% of the soil, the magnitudes of the heave rates are similar. Four factors were found to control heave rate: (1) the rate of heat conduction away from the freezing front, (2) the hydraulic resistance in the frozen fringe, (3) the hydraulic resistance at the ice lens, and (4) the hydraulic resistance in the unfrozen soil. The model predicts ice lensing and heave rates as functions of basic soil properties, and the results are in general agreement with experimental observations. The model does not account for changes in consolidation of the soil that may occur as a result in changes in pore ice pressure. In the model, the soil particles are assumed to form a rigid skeleton which breaks only when the ice pressure exceeds some specific pressure. (Small-FRC)

2E. Streamflow and Runoff

CONSIDERATIONS REGARDING THE APPLICATION OF SCS TR-55 PROCEDURES FOR RUNOFF COMPUTATIONS,
Ottawa Univ. (Ontario). Dept. of Civil Engineering.
P. Wisner, S. Gupta, and A. Kassem.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-173858, Price codes: A11 in paper copy, A01 in microfiche. In: Proceedings, Stormwater Management Model (SWMM) Users Group Meeting, 19-20 June, 1980, Toronto, Ontario, Environmental Protection Agency Report EPA 600/9-80-064, December, 1980, p 23-44. 6 Fig, 5 Tab, 18 Ref.

Descriptors: *Runoff forecasting, *Model studies, *Storm water, Hydrographs, Rainfall - runoff relationships, Streamflow, Peak discharges, Watersheds(Basins), Infiltration rates, Design storm.

The Soil Conservation Service (SCS) Technical Release 55 (TR-55) presents simplified tabular and graphical methods for estimating runoff volumes, peak discharges and discharge hydrographs for runoff computations. The SCS TR-55 computational procedures and data requirements are critically reviewed. A comparative assessment of peak discharge and hydrograph computations with other widely used models was carried out using several hypothetical watersheds. Limitations introduced by the meteorological input assumptions and the methodology for calculation of infiltration and other losses include: a particular distribution and a specific duration design storm, and weighted averaging of curve numbers for pervious and impervious areas which may lead to overestimation of rainfall losses corresponding to one half to one tenth-year storms. The two procedures for peak discharge computations in TR-55 lead to different results. The second method giving peak flows in terms of areas and slopes seems to significantly underestimate peak flows. For the same meteorological input and rainfall losses, simulations carried out by the time of concentration method underestimated the peak flows for areas up to 160 acres as compared to Storm Water Management Model. The tabular procedures in the SCS TR-55 for routing runoff hydrographs through stream channels seem to underestimate the flows and can be used only in conjunction with a 24 hour, Type II storm. Use of the convex method seems to be more accurate and can be used for any hydrograph profile. (Moore-SRC)

Descriptors: *Urban runoff, *Storm runoff, *Model studies, *Water pollution, Computer programs, Water quality, Storm water, Small watersheds, Hydrographs.

Most existing stormwater models have complicated structure, require extensive input data, and do not incorporate the qualitative aspect of the urban runoff phenomena efficiently. A quantity and quality urban runoff simulation model with simple input requirements was developed to be used in the planning and analysis of stormwater systems. The Modified Linearized Subhydrographs Urban Runoff Model (MLSUPM) consists of a quantity submodel and a quality submodel. The model was applied to two typical urban drainage areas with measured runoff data corresponding to various gaged storm events. The model simulated stormwater hydrograph well for small urban catchments with little calibration effort. The successful simulation of hydrographs for large watersheds is also achieved if the watersheds are subdivided into small catchements. Satisfactory pollutograph simulations were also obtained by using calibrated parameter values. The model may be used as an alternative to the more comprehensive and complex models in the planning and analysis of stormwater systems. It incorporates simple but physically realistic parameters in the simulation of runoff of stormwater. (Moore-SRC)

METHODOLOGY FOR 'LUMPED' SWMM MODELLING,
Edmonton Water and Sanitation Dept. (Alberta).
M. Ahmad.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-173858, Price codes: A11 in paper copy, A01 in microfiche. In: Proceedings, Stormwater Management Model (SWMM) Users Group Meeting, 19-20 June, 1980, Toronto, Ontario, Environmental Protection Agency Report EPA 600/9-80-064, December, 1980, p 64-79. 14 Fig, 2 Tab, 7 Ref.

Descriptors: *Urban runoff, *Storm runoff, *Model studies, *Storm drains, Hydrographs, Rainfall-runoff relationships, Urban drainage, Canada, Methodology, Costs.

A systematic methodology is presented for lumping or aggregating urban drainage areas when using the Storm Water Management Model (SWMM) to simulate the rainfall-runoff process. In a lumped model the study area is discretized into large subcatchments, and as such the spatial details of hydrologic characteristics and the internal drainage system are not explicitly modelled. As a part of the simplified methodology, the concept of equivalent gutter was introduced in RUNOFF block simulation to compensate for the eliminated conduit storage existing within the lumped catchment. A set of generalized curves relating in-system conduit storage to impervious area were developed using relevant data from new residential and industrial subdivisions in Edmonton, Canada. Curves relating the drainage area to the peak flow for a range of imperviousness values were also generated. A systematic step by step procedure that uses these curves to determine the overland flow width parameter and the dimensions of the representative equivalent gutter appropriate for the lumped catchment was formulated. The lumping methodology was tested against detailed simulations using rainfall and flow measurements for three recorded storm events for the Norwood test area. Modelling results employing lumped and detailed schemes, respectively, were also compared for the 5-year design storm using the catchment data for the Fulton Drive basin. Comparisons of detailed and lumped simulations for both test areas were found to be reasonably good. A significant reduction both in the amount of effort required in input data preparation and in the overall simulation costs can be achieved by employing this lumping methodology. (Moore-SRC)

HYDROGRAPH SYNTHESIS BY THE HNV-SBUH METHOD UTILIZING A PROGRAMMABLE CALCULATOR,
Howard, Needles, Tammen and Bergendoff, Orlando, FL.
B. L. Golding.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-173858, Price codes: A11 in paper copy, A01 in microfiche. In: Proceedings, Stormwater Management Model (SWMM) Users Group Meeting, 19-20 June, 1980, Toronto, Ontario, Environmental Protection Agency Report EPA 600/9-80-064, December, 1980, p 150-177. 36 Fig, 8 Tab, 11 Ref.

Descriptors: *Urban runoff, *Hydrographs, *Model studies, *Runoff, Computer programs, Rainfall-runoff relationships, Urban drainage, Soil properties, California, *Santa Barbara Urban Method(Runoff)

The Howard Needles Version of the Santa Barbara Urban Hydrograph Method (HNV-SBUH Method) is a fairly simple, yet easily applied low cost model for computing design flow hydrographs using either a programmable pocket calculator or a microcomputer. The HNV-SBUH Method with the four standard infiltration curves is an effective method of simulating acceptable runoff hydrographs from urban drainage basins. Hydrographs can be computed in 20 minutes on a programmable calculator and in 10 minutes on a microcomputer by an engineering technician. In this method, the final design hydrograph is obtained by routing the instantaneous hydrograph for each time period, obtained by multiplying the incremental rainfall excesses by the entire watershed area in acres, through an imaginary linear reservoir with a routing constant equivalent to the time of concentration of the drainage basin. Four urban drainage basins of different sizes, locations and character were selected for use in model validation. Runoff hydrographs from residential areas or other urban areas with less than 50% impervious cover are extremely sensitive to antecedent moisture conditions and the infiltration capacity of the soil in the basin such that the use of a more sophisticated model may not be warranted. (Moore-SRC)
W81-01929

A REPRESENTATION OF AN INSTANTANEOUS UNIT HYDROGRAPH FROM GEOMORPHOLOGY,
Mississippi Univ., University. Dept. of Civil Engineering
V. K. Gupta, E. Waymire, and C. T. Wang
Water Resources Research, Vol 16, No 5, p 855-862, October, 1980. 4 Fig, 25 Ref

Descriptors: *Mathematical models, *Geomorphology, *Rainfall-runoff relationships, Hydrographs, Watersheds(Basins), Water levels, Instantaneous unit hydrograph, Streamflow, River basins.

A probabilistic approach for determining the functional form and the parameters of the instantaneous unit hydrograph was developed on the basis of the geomorphology of a river basin. The channel network and the overland flow regions in a river basin satisfy Horton's empirical geomorphologic laws when ordered according to the Strahler ordering scheme. This setting can be employed in a kinetic theoretical framework for obtaining an explicit mathematical expression for the instantaneous unit hydrograph at the basin outlet. Some preliminary physical ideas are developed for estimating the parameters appearing in the instantaneous unit hydrograph representation in terms of empirical geomorphologic laws of stream numbers, stream lengths, etc. The theoretical results were compared with observed flows for three basins in Illinois. There was good agreement with two larger basins, but an underestimation of the peak flow for the third, smaller basin. Thus, the assumption of linearity of rainfall-runoff transformation is questionable for smaller basins. (Small-FRC)

FAULTING CAUSED BY GROUNDWATER LEVEL DECLINES, SAN JOAQUIN VALLEY, CALIFORNIA,
Geological Survey, Menlo Park, CA.
T. L. Holzer.
Water Resources Research, Vol 16, No 6, p 1065-1070, December, 1980. 5 Fig, 1 Tab, 22 Ref.

Descriptors: *Groundwater, *Land subsidence, *Geological faults, Withdrawal, Hydrogeology, Settlement, Compaction, Irrigation, Water levels, *Water level fluctuations, San Joaquin Valley(CA), Seasonal.

Collected evidence suggests that faulting in the San Joaquin Valley is related to groundwater level declines caused by groundwater withdrawals for crop irrigation. Modern faulting postdates the beginning of water level declines and associated subsidence. Movement detected in a longterm survey was seasonal, corresponding to water level fluctuations. Fault offset was greater in the year with the lower seasonal low water level. Localized differential compaction across the preexisting fault is proposed as the cause of modern fault movement. LOW-FLOW CHARACTERISTICS OF STREAMS IN THE UPPER WISCONSIN RIVER BASIN, WISCONSIN,
Geological Survey, Madison, WI. Water Resources Div.
W. A. Gebert.
Available from the OFSS, USGS Box 25425, Fed. Ctr., Denver, CO 80225, Price: $8.75 in paper copy, $4.50 in microfiche. Geological Survey Open-File Report 80-691 (WRI), July, 1980. 60 p, 7 Fig, 2 Plates, 3 Tab, 17 Ref.

Descriptors: *Low flow, *Streamflow, *Low flow frequency, *Streamflow forecasting, *Regression analysis, Evaluation, Equations, Base flow, Flow characteristics, Flow duration, Flow rates, Wisconsin, *Upper Wisconsin River basin.

Low-flow characteristics of streams in the upper Wisconsin River basin are presented. Included are estimates of low-flow frequency at 10 gaging stations, flow duration at 8 gaging stations, and low-flow frequency characteristics at 13 low-flow partial-record stations and 81 miscellaneous sites. Equations are provided to estimate low-flow characteristics at ungaged sites and at sites where one base-flow discharge measurement is available. The equations were determined from multiple-regression analyses that related low-flow characteristics at gaging stations and low-flow partial-record stations to basin characteristics. The standard error of estimate is provided for each method of estimating the annual minimum 7-day mean flow below which the flow will fall on the average of once in 2 years and once in 10 years. The standard error of estimate for the 7-day 10-year low flow ranged from 9% to 113% depending on the type of data available. Standard error provides the user with the expected degree of accuracy for each method. (USGS)

FLOOD OF FEBRUARY 1980 ALONG THE AGUA FRIA RIVER, MARICOPA COUNTY, ARIZONA,
Geological Survey, Tucson, AZ. Water Resources Div.
B. W. Thomsen.
Available from the OFSS, USGS Box 25425, Fed. Ctr., Denver, CO 80225, Price: $4.75 in paper copy, $0.50 in microfiche. Geological Survey Open-File Report 80-767, June, 1980. 1 Sheet, 4 Fig, 2 Ref.

Descriptors: *Floods, *Rainfall, *Runoff, *Arizona, Reservoir releases, Flood flow, Flood discharge, Flood recurrence interval, Historic floods, Flood frequency, Regression analysis, Aerial photography, *Maricopa County(AZ), *Aqua Fria River(AZ), Lake Pleasant(AZ), Waddell Dam(AZ).

The flood of February 20, 1980, along the Agua Fria River below Waddell Dam, Maricopa County, Ariz., was caused by heavy rains during February 13-20. The runoff filled Lake Pleasant and resulted in the largest release--66,600 cubic feet per second--from the reservoir since it was built in 1927; the maximum inflow to the reservoir was about 73,300 cubic feet per second. The area inundated by the releases includes about 28 miles along the channel from the mouth of the Agua Fria River to the Beardsley Canal flume crossing 5 miles downstream from Waddell Dam. The flood of 1980 into Lake Pleasant has a recurrence interval of about 47 years, whereas the flood of record (1919) has a recurrence interval of about 100 years. (USGS)

STREAMFLOW CHARACTERISTICS OF THE YELLOWSTONE RIVER BASIN, MONTANA, THROUGH 1976,
Geological Survey, Helena, MT. Water Resources Div.
L. G. Moore, and R. R. Shields.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-120859, Price codes: A04 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 80-41, July, 1980. 67 p, 2 Fig, 8 Ref.

Descriptors: *Streamflow, *Flow characteristics, *River basins, *Montana, Data collections, Gaging stations, Crest-stage gages, Low flow frequency, Flow duration, Flood frequency, Surface waters, Water resources development, *Yellowstone River basin(MT).

Statistical summaries of streamflow data for selected stream-gaging and crest-stage gage sites are presented in this report to aid in appraising the hydrology of the Yellowstone River basin, Montana. Streamflow records presented for 45 gaging stations and 45 crest-stage gages for the period of record. Streamflow record collection in the Yellowstone River basin began in 1889. For each gaging station selected for this report, a brief description is given for station location, drainage area, period of record, revisions of previously published records, type and history of gages, regulation and diversions, and extremes of discharge. These data are followed by tables of monthly and annual flow statistics, high-flow and low-flow frequency data, flood-frequency data, flow-duration information, and for natural-flow sites selected basin characteristics. For each crest-stage gage, the brief description consists of location, drainage area, period of record, and type and history of gage. This information is followed by tables of flood-frequency data and selected basin characteristics. (USGS)

AN ANALYSIS OF THE MAGNITUDE AND FREQUENCY OF FLOODS ON OAHU, HAWAII,
Geological Survey, Honolulu, HI. Water Resources Div.
R. H. Nakahara.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-109902. Price codes: A03 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 80-45, June, 1980. 20 p, 1 Fig, 9 Tab, 9 Ref.

Descriptors: *Floods, *Peak discharge, *Flood frequency, *Regression analysis, *Hawaii, Analytical techniques, Frequency analysis, Flood peak, Flood forecasting, Flood recurrence interval, Watersheds(Basins), Basin characteristics, Gaging stations, Sites, *Oahu(HI).

An analysis of available peak-flow data for the island of Oahu, Hawaii, was made by using multiple regression techniques which related flood-frequency data to basin and climatic characteristics for 74 gaging stations on Oahu. In the analysis, several different groupings of stations were investigated, including divisions by geographic location and size of drainage area. The grouping consisting of two leeward divisions and one windward division produced the best results. Drainage basins ranged in area from 0.03 to 45.7 square miles. Equations relating flood magnitudes of selected frequencies to basin characteristics were developed for the three divisions of Oahu. These equations can be used to estimate the magnitude and frequency of floods for any site, gaged or ungaged, for any desired recurrence interval from 2 to 100 years. Data on basin characteristics, flood magnitudes for various recurrence intervals from individual station-frequency curves, and computed flood magnitudes by use of the regression equation are tabulated to provide the needed data. HYDROLOGIC IMPACT OF DRAINING SMALL DEPRESSIONAL WATERSHEDS,
Kentucky Univ., Lexington. Dept. of Agricultural Engineering.
I. E. Moore, and C. L. Larson.
Journal of the Irrigation and Drainage Division, Proceedings of the American Society of Civil Engineers, Vol 106, No IR4, p 345-363, December, 1980. 9 Fig, 7 Tab, 21 Ref.

Descriptors: *Runoff, *Drainage, *Watershed management, *Minnesota, Flow rates, Mathematical models, Floods, Storms, Small watersheds.

The Minnesota Model for Depressional Watersheds was developed to study the hydrologic impact of draining small watersheds characterized by numerous depressions. The model was applied to two small watersheds in Jackson County, Minnesota, to determine maximum flow rates on a frequency basis and to determine the effects of various types and degrees of drainage on watershed runoff throughout the year. The physical characteristics of the main water course in the watershed represent the major factor influencing peak discharge rates at the watershed outlet. Annual flood flows on the Minnesota River at Mankato suggested that downstream effects of drainage development on large watersheds are much slighter than was indicated by this study on small watersheds. Drainage of individual depres-

sions in the watersheds had less effect on peak flows from high intensity, short duration storms than from low intensity storms and storm melt. (Small-FRC)

DETENTION STORAGE FOR URBAN FLOOD CONTROL,
Espey Huston and Associates, Inc., Dallas, TX.
D. P. Smith, Jr., and P. B. Bedient.
Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers, Vol 106, No WR2, p 413-425, July, 1980. 4 Fig, 6 Tab, 17 Ref.

Descriptors: *Detention reservoirs, *Flood control, *Urbanization, Brays Bayou, Houston, *Texas, Channels, Water policy, Water conveyance, Runoff, Water control, Flood protection, Flood recurrence level, River basin development, Watershed management, Hydrology, Flood forecasting.

The effect of the location and size of detention storage on downstream flood flows in an urbanizing watershed was studied using the Corps of Engineers HEC-1 simulation model. The example chosen was Brays Bayou, Houston, Texas, for which extensive hydrologic and land use data was available. This low-relief area, the scene of rapid upstream urbanization, has a history of severe flood damages in spite of a large flood control project implemented in the 1950's. Storage detention alternatives considered rainfall frequency, peak flows and timing, and land use. A baseline, established using existing development with no detention storage, indicated a 10-year storm as the upper limit. In the case of added development with storage only for this newly built-up area, a 5 year storm could be safely carried by the channel. If detention ponds were available in both existing and future development, a 10-year event would be successfully handled. In the Brays Bayou, added storage areas will not significantly improve flooding conditions because the character of the lower basin dominates. However, in a less urbanized basin, detention storage could protect downstream areas and control sediment and flood waters as the upper basin develops. (Cassar-FRC)

POLITICAL ASPECTS OF URBAN STORMWATER MANAGEMENT,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Coll. of Engineering.
L. A. Brown.
Journal of the Water Resources Planning and Management Divsion, Proceedings of the American Society of Civil Engineers, Vol 106, No WR1, p 265-273, March, 1980. 2 Fig, 3 Tab, 3 Ref.

Descriptors: *Storm water, *Urbanization, *Political aspects, *Flood control, DeKalb County, *Georgia, Atlanta, Decatur, Planning, Storm runoff, Constraints, Drainage programs, Water policy, Administration, Water management(Applied), Regulation, Zoning, Flood plain zoning, River basins.

Management of stormwater during 1973-1979 in DeKalb County, Georgia, with respect to political aspects is described. This county contains 30% of metropolitan Atlanta and the city of Decatur. It was the site of extensive development and flood plain encroachment prior to 1973. Although it was possible to pass development ordinances and zoning requirements that did not require county funds, only short-term projects showing immediate, visible results were of interest to some elected officials. Projects with long-term, general benefits had limited appeal. It is suggested that benefits such as environmental protection, conservation, improved road transportation, better community image, and reduced damages to individuals will concern a broad base of the citizens, who can influence political bodies to implement a stormwater management program. (Cassar-FRC)

A MIXED NUMERICAL ANALYTICAL METHOD FOR GROUNDWATER FLOW SIMULATION,
IBM Scientific Center, Haifa (Israel).
D. Ramm, and D. Chazan.
Water Resources Research, Vol 16, No 5, p 871-880, October, 1980. 10 Fig, 5 Ref.

Descriptors: *Groundwater movement, *Subsurface flow, *Mathematical models, Aquifers, Equations, Wells, Inflow, Water pollution sources, Rivers, Springs, Salts.

A scheme is presented which permits the computation of the complex field behavior in an area which is densely populated with wells, using a coarse grid and a modest computational effort. This method is an efficient way to generate the information which will allow tracking of salt trajectories even in areas containing densely spaced wells because of the assumption that the flow is two dimensional. The method is a tool for solving flow equations, but may also be used to solve the flow problem and in the calibration of a model. A number of examples are presented which demonstrate the accuracy of the scheme. The scheme can be modified to take into account springs, rivers, phreatic aquifers, and multilayered aquifers. This scheme is of importance when a flow of pollutants must be determined in an area with many singularities. (Small-FRC)

VALIDITY OF CUBIC LAW FOR FLUID FLOW IN A DEFORMABLE ROCK FRACTURE,
California Univ., Berkeley.
P. A. Witherspoon, J. S. Y. Wang, K. Iwai, and J. E. Gale.
Water Resources Research, Vol 16, No 6, p 1016-1024, December, 1980. 9 Fig, 2 Tab, 18 Ref.

Descriptors: *Geologic fractures, *Stress, *Flow, *Mathematical studies, Hydrogeology, Flow measurement, Fluid mechanics, Flow characteristics, Geology, Fractures, Permeability, Porosity, Cracks.

Results of a laboratory investigation of fluid flow in deformable rock are presented. Tension fractures were artificially induced in homogeneous samples of granite, basalt and marble, and flow tests under closed conditions were conducted. The investigations included both radial and straight flow geometries and covered apertures ranging from 250 to 4 micrometers. The cubic law for flow in a fracture was confirmed repeatedly, regardless of loading path and frequency of loading process, open or closed fractures, or rock type. The controlling factor in fluid flow and permeability is the size of the fracture aperture. Slight changes in aperture can dominate any other change in the geometry of the flow field. (Titus-FRC)

INSTABILITY IN AQUIFER IDENTIFICATION: THEORY AND CASE STUDIES,
Arizona Univ., Tucson. Dept. of Systems and Industrial Engineering.
S. Yakowitz, and L. Duckstein.
Water Resources Research, Vol 16, No 6, p 1045-1064, December, 1980. 2 Fig, 15 Tab, 35 Ref.

Descriptors: *Aquifer characteristics, *Transmissivity, Analysis, *Groundwater movement, Aquifers, Theoretical analysis, Hydrological properties, Head loss, Parametric hydrology, Algorithms, Mathematical studies, Measurement, Model studies.

A discussion of measurement error in transmissivity estimates and aquifer identification schemes is presented, based on theoretical analyses and case studies. An aquifer simulation model was constructed using best estimates of transmissivity and head. Transmissivity estimates were obtained both through programming and with an algebraic method which incorporated field parameters and discharge-recharge values. Radical changes in transmisivity values produced scarcely perceptible changes in head, revealing a problem of sensitivity in aquifer identification. In order for the error covariance to be within usable range the piezometric heads would have to be known to be within a few inches of accuracy. The accuracy problems in the methods presented suggest that the problem of aquifer identification can not be properly addressed by existing models. Results imply that alternative methods such as multidimensional interpolation to estimate heads at unmeasured locations and nonparametric models may produce more useful information. (Titus-FRC)

THEORETICAL HEAD VARIOGRAMS FOR STEADY FLOW IN STATISTICALLY HOMOGENEOUS AQUIFERS,
Princeton Univ., NJ. Dept. of Civil Engineering.
G. R. Chirlin, and G. Dagan.
Water Resources Research, Vol 16, No 6, p 1001-1015, December, 1980. 10 Fig, 1 Tab, 22 Ref.

Descriptors: *Aquifers, *Groundwater movement, *Transmissivity, Flow, Variability, Model studies, Aquifer systems, Boundaries, Hydrogeology, Rock properties, Aquifer characteristics, Head loss, Fluctuations, Statistical methods, On-site tests, Mathematical studies.

A model is presented which produces an expression for the head variogram of an aquifer given a statistical description of the transmissivity field. The model assumes a steady, uniform average flow in a completely random medium of cylindrical blocks whose size and transmissivity are independent. It employs the self-consistent model of flow physics. Limited available data prohibit greater refinement of the model at present. Results in a hypothetical case suggest that kriged standard deviation is overestimated perpendicular to the mean flow and underestimated parallel to it. The model has application in fitting typically inconclusive data points, and contributes to a technique which reduces scattering in plots of variograms from field data. (Titus-FRC)

LAND-SURFACE SUBSIDENCE IN THE TEXAS COASTAL REGION,
Geological Survey, Austin, TX. Water Resources Div.
K. W. Ratzlaff.
Available from the OFSS, USGS Box 25425, Fed Ctr., Denver, CO 80225. Price: $3.50 in paper copy, $6.00 in microfiche. Geological Survey Open-File Report 80-969, September, 1980. 19 p, 8 Fig, 24 Ref.

Descriptors: *Land subsidence, *Compaction, *Groundwater, *Overdraft, *Texas, Aquifers, Water levels, Withdrawal, Oil reservoirs, Mining, *Houston-Galveston area(TX).

Land-surface subsidence has been mapped in the Houston-Galveston area and is known to have occurred in other areas within the Texas coastal region. Most of the subsidence has been caused by both the withdrawal of groundwater and by the production of oil, gas, and associated groundwater. Land-surface subsidence was determined by com-

paring adjusted elevations of bench marks for various periods of releveling and by comparing topographic maps of the same areas for different years. In general, most of the Texas coastal region has subsided less than 0.5 foot. The largest amount measured in the region is in the Pasadena-Houston Ship Channel area, where the land surface subsided between 8.5 and 9.0 feet during 1906-73. The cause of the subsidence in this area was groundwater withdrawals. Local subsidence caused by sulfur mining in the Moss Bluff Salt Dome area has been reported to exceed 15 feet. In Jefferson County, the Spindletop Dome area subsided approximately 5 feet during 1925-77, and the Port Acres area subsided about 3 feet during 1959-77, mainly because of withdrawal of oil or gas and associated groundwater. Local subsidence caused by sulfur mining in the Spindletop Dome area has been estimated to exceed 10 feet. In southeastern Jackson County and northwestern Matagorda County, the land surface subsided more than 1.5 feet during 1943-73 as a result of groundwater withdrawals. Withdrawals of oil, gas, and associated groundwater caused more than 5 feet of subsidence during 1942-75 in the western part of Corpus Christi in Nueces County. (USGS)

GROUNDWATER HYDROLOGY OF THE SAGEBRUSH FLAT AREA AND POSSIBLE RELATIONS TO THE DISCHARGE OF RATTLESNAKE SPRINGS, GRANT AND DOUGLAS COUNTIES, WASHINGTON,
Geological Survey, Tacoma, WA. Water Resources Div.
K. L. Walters.
Available from the OFSS, USGS Box 25425, Fed. Ctr., Denver, CO 80225, Price: $4.00 in paper copy, $3.50 in microfiche. Geological Survey Open-File Report 79-1530 (WRI), 1980. 27 p, 9 Fig, 3 Tab, 4 Ref.

Descriptors: *Groundwater, *Water wells, *Aquifers, *Surface-groundwater relationships, *Washington, Hydrogeology, Well data, Water level fluctuations, Pumping, Groundwater movement, Chemical analysis, Hydrographs, Grant County(WA), Douglas County(WA).

In 1978, the U.S. Geological Survey, in cooperation with the State of Washington Department of Ecology, investigated the hydrology of the Sagebrush Flat area as it relates to Rattlesnake Springs. Rattlesnake Springs and all known wells on Sagebrush Flat obtain water from basalt aquifers. The wells tap aquifers at or below the altitude of the spring discharge. Water levels in some wells on Sagebrush Flat, and in a well 27 miles to the northeast in an area of no groundwater development, show slight fluctuations that may correspond to annual variations in precipitation. However, hydrographs of most wells on Sagebrush Flat show water-level declines and rises that correspond with the beginning and end of the pumping season. The discharge of Rattlesnake Springs started to decrease at about the beginning of the 1978 pumping season and did not start to increase until after most pumping was stopped. The water level in deep aquifers beneath Sagebrush Flat is at a lower altitude than in shallow a quifers, and water moves down well boreholes from shallow aquifers to deeper aquifers. This downward movement of water diverts groundwater that is moving toward natural discharge points such as Rattlesnake Springs, thereby decreasing the discharge at these points. (USGS)

GROUNDWATER AVAILABILITY IN CARBONATE ROCKS OF THE DANDRIDGE AREA, JEFFERSON COUNTY, TENNESSEE,
Geological Survey, Nashville, TN. Water Resources Div.
E. F. Hollyday, and P. L. Goddard.
Geological Survey Open-File Report 79-1263 (WRI), 1980. 50 p, 22 Fig, 9 Tab, 8 Ref.

Descriptors: *Groundwater, *Groundwater availability, Karst, Limestones, *Tennessee, *Carbonate rocks, Groundwater movement, Hydrogeology, Aquifer characteristics, Natural recharge, Water wells, Water yield, Physical properties, Hydrologic data, *Jefferson County(TN), Valley and Ridge physiographic province.

Groundwater in Jefferson County, Tenn., occurs in solution openings that follow bedding planes and strike joints in the dense limestone and dolomite. Recharge beginning at topographic highs in the northwest moves across strike to lows in the southeast; it is intercepted and collected by high permeability beds in the middle of the Knox Group and is routed along strike to discharge at large springs. Exploratory wells were drilled at two sites to test this concept of the flow system. Three wells at Moore Spring site in the recharge area penetrated only mud and solid rock. Four wells at Riley Spring site in the discharge area each penetrated at least five water-bearing openings that gave these wells an average production of 93 gallons per minute and a maximum of 180 gallons per minute. GROUNDWATER MODELS FOR WATER RESOURCES PLANNING,
Geological Survey, Reston, VA. Water Resources Div.
J. E. Moore.
Geological Survey Open-File Report 80-581, 1980. 22 p, 11 Ref.

Descriptors: *Groundwater resources, *Computer models, *Model studies, *Planning, Analog models, Groundwater movement, Mathematical models, Water resources development, San Luis Valley(CO), Arkansas River Valley(CO), Rocky Mountain Arsenal(CO), Southwest Florida, Forecasting, Groundwater availability, Water quality.

In the past decade hydrologists have emphasized the development of computer-based mathematical models to aid in the understanding of flow, the transport of solutes, transport of heat, and deformation in the groundwater system. These models have been used to provide information and predictions for water managers. Too frequently, groundwater was neglected in water-resource planning because managers believed that it could not be adequately evaluated in terms of availability, quality, and effect of development on surface water supplies. Now, however, with newly developed digital groundwater models, effects of development can be predicted. Such models have been used to predict hydrologic and quality changes under different stresses. These models have grown in complexity over the last 10 years from simple one-layer flow models to three-dimensional simulations of groundwater flow which may include solute transport, heat transport, effects of land subsidence, and encroachment of salt water. This paper illustrates, through case histories, how predictive groundwater models have provided the information needed for the sound planning and management of water resources in the United States. HYDROLOGY OF THE SELDOVIA AREA, ALASKA,
Geological Survey, Anchorage, AK. Water Resources Div.
G. L. Nelson, and W. R. Danskin.
Available from the OFSS, USGS Box 25425, Fed. Ctr., Denver, CO 80225, Price: $3.50 in paper copy, $1.00 microfiche. Geological Survey Open-File Report 80-952 (WRI), 1980. 2 Sheets, 5 Fig, 2 Tab, 5 Ref.

Descriptors: *Hydrogeology, *Groundwater, *Surface waters, *Water resources, *Alaska, Glacial drift, Aquifers, Water wells, Water pollution sources, Streamflow, Water utilization, Chemical analysis, *Seldovia area(AK), Kenai Peninsula(AK), Cook Inlet(AK).

Surficial materials in the Seldovia area, Alaska, are mapped as glacial drift over sedimentary bedrock, glacial drift over igneous and metamorphic bedrock, valley-bottom, alluvium, alluvial fan deposits, beach and intertidal deposits, and peat. Unconsolidated materials are generally less than 10 feet thick except in well-drained glacial deposits along the Seldovia-Jakolof Bay Road and in depressions in the bedrock surface. These depressions are poorly drained and commonly contain peat bogs. Development of domestic wells (1-15 gallons per minute) may be possible from unconsolidated materials and sedimentary bedrock, but larger water requirements must be met from surface-water sources. In areas having the water table or top of bedrock at shallow depths, effluent from sewage disposal systems may cause pollution of the land surface and nearby surface water. Seepage from hillside aquifers and unstable land along the coast of Kachemak Bay may adversely affect roads and structures. (USGS)

2G. Water In Soils

SURVEY OF METHODS FOR SOIL MOISTURE DETERMINATION,
National Aeronautics and Space Administration, Greenbelt, MD. Goddard Space Flight Center.
T. J. Schmugge, T. J. Jackson, and H. L. McKim.
Water Resources Research, Vol 16, No 6, p 961-979, December, 1980. 13 Fig, 2 Tab, 169 Ref.

Descriptors: *Soil moisture, *Remote sensing, *Measurement, Application methods, Soil physics, Moisture content, Subsurface waters, Evapotranspiration, Evaporation, Instrumentation, Hydrological cycle, Transpiration, Methodology, Testing procedures, On-site tests, Analytical techniques.

A survey of methods for determining soil moisture is presented. The three general approaches are in situ or point measurements, soil water models, and remote sensing. All methods should meet three requirements: frequent observations, an estimate of moisture within the top 1-2 meters of soil, and a description of moisture variations over a large expanse, such as a county or state. In situ methods include gravimetric, nuclear and electromagnetic techniques. These are only accurate at the point of measurement and would require considerable manpower. Soil water models are based on meteorological parameters including precipitation and evapotranspiration. These methods provide fast answers for large areas, but require costly data which can be difficult to obtain and can introduce error into the models. Remote sensing uses solar, thermal infrared, and microwave radiation. It offers rapid data collection over large areas on a repetitive basis. However, spatial resolution and cost are limitations. An integrated system of soil moisture determination which combines various approaches is suggested as the most cost-effective and informative method. (Titus-FRC)

A SIMPLIFIED FUNCTIONS APPROACH FOR DETERMINING SOIL HYDRAULIC CONDUCTIVITIES AND WATER CHARACTERISTICS IN SITU,
Hawaii Univ., Honolulu. Water Resources Research Center.
L. R. Ahuja, R. E. Green, and S-K. Chong.
Water Resources Research, Vol 16, No 5, p 947-953, October, 1980. 17 Fig, 16 Ref. OWRT-B-054-HI(4).

Descriptors: *Theoretical analysis, *Soil water movement, Watersheds, Drainage, Model studies, Mathematical models, Darcy's law, Groundwater movement, *Hydraulic conductivity, Soil moisture.

In order to determine the hydraulic conductivity and soil water content of a watershed soil from minimum in situ field measurements, it was as-

sumed that the former was a piecemeal power form and the latter a linear logarithmic function of the soil water suction. The values of these functions were measured by analysis of drainage phase tensiometric data plus field values of near saturated conductivity and one sampling of soil moisture during drainage. The theory set forth allows the calculation of the unsaturated hydraulic conductivity and diffusivity without the prior knowledge of soil water features which is required for Darcian analysis, a more rigorous method. The model was applied to field measurements taken on four Hawaiian soils and one California soil with generally satisfactory results. In some instances where there were differences in the conductivity values for very small suctions, the discrepancies were attributed to field measurement errors or the use of soil core water characteristics for the very wet region in the Darcian system. Although the slope parameter of the water characteristic function was more sensitive to the scatter in the input data, the overall simplified method seemed promising for use in computing soil water content and saturated hydraulic conductivity. RAIN INFILTRATION INTO LAYERED SOILS: PREDICTION,
Mosul Univ. (Iraq). Dept. of Irrigation Engineering.
A. Y. Hachum, and J. F. Alfaro.
Journal of the Irrigation and Drainage Division, Proceedings of the American Society of Civil Engineers, Vol 106, No IR4, p 311-319, December, 1980. 2 Fig, 2 Tab, 15 Ref.

Descriptors: *Wetting, *Rainfall, *Mathematical models, Infiltration, Soil moisture, Soil water movement, Hydrologic properties, Irrigation, Nonuniform soils, *Layered soils.

The Green-Ampt approach for describing vertical infiltration into nonuniform soils is extended to rain applications. The model contains three measurable input parameters which are based on properties and initial soil profile conditions. Darcy's law is combined with the continuity principle subjected to the assumptions of a sharp abrupt wetting front, a constant hydraulic conductivity in the wetted zone, a constant water pressure head at the wetting front, and negligible effect of raindrops in the infiltration process. Model performance was compared to results with a second model derived from general flow theory, and good agreement was found. Results are compared for different soil profiles and rain intensities. Numeric examples are given. The conditions under which soil surface saturation and water ponding occur are examined. The model is shown to be a useful, workable tool in irrigation and hydrology to approximate infiltration in soils which are not uniform. (Small-FRC)

AN IMPROVED PROCEDURE FOR MEASURING WATER RETENTION CURVES AT LOW SUCTION BY THE HANGING-WATER-COLUMN METHOD,
Volcani Inst. of Agricultural Research, Bet-Dagan (Israel).
P. Berliner, P. Barak, and Y. Chen.
Canadian Journal of Soil Science, Vol 60, No 3, p 591-594, August, 1980. 3 Fig, 4 Ref.

Descriptors: *Instrumentation, *Retention, Soil water, Soil physical properties, Soil texture, Soil moisture, Soil water movement, Soil-water-plant relationships, Evaporation, Water retention, *Soil moisture retention, *Israel.

An improved method for measuring soil water retention curves at low suction levels of 0-300 mbar by the hanging-water-column technique is described. The procedure involves weighing the released water without disconnection of the cell from the tubing, resulting in a level of precision of + or - 0.01 g water. Errors from volumetric changes due to evaporation are avoided, and equilibrium at each point is attained with ease. The apparatus consists of a balance, a fritted glass funnel, flexible latex tubing and a glass Mariotte tube that is lowered to produce a hanging water column. Three soils from Israel were analyzed by conventional equipment and the new device, and the retention curves obtained by the two methods were compared. Good agreement was obtained in triplicate trials performed by the present technique, as well as between these results and those obtained by the conventionally used procedure. (Geiger-FRC)

2H. Lakes

SOME CONSIDERATIONS ON THE DENSE POPULATION OF A PURPLE SULFUR BACTERIUM, CHROMATIUM SP. AT THE MID-DEPTH OF LAKE KAIIKE,
Nagasaki Univ. (Japan). Faculty of Fisheries.
M. Matsuyama.
Japanese Journal of Limnology, Vol 41, No 2, p 84-94, April, 1980. 8 Fig, 27 Ref.

Descriptors: *Bacteria, *Sulfur bacteria, *Lakes, *Stratification, *Chromatium sp, Hydrogen sulfide, *Lake Kaiike(Japan), Japan, Reduction(Chemical), Aquatic bacteria, Algae, Aquatic plants, Light penetration, Aquatic environment, Phosphorus compounds, Nitrogen compounds, Nutrients, Light intensity, Aphotic zone, Penetration.

A dense population, 5 million cells per ml, of a purple sulfur bacterium, Chromatium sp., was found in a thin horizontal layer at mid-depth, 4.75 meters, in the small stratified lake, Lake Kaiike, Kamikoshiki Island, Japan. Although this bacterium grows more slowly than algae, it uses the inorganic nutrients and hydrogen sulfide produced in the deeper water, permitting little nutrient material to rise into the upper layers for utilization by algae. Light attenuation studies showed that the bacterial plate significantly decreases light available below it. The layer of water beneath the bacteria was in a reducing condition, containing hydrogen sulfide at a maximum level of 19 mg S per liter at 5.5 meters depth and no dissolved oxygen below 4.75 meters. CHANGES IN PHOSPHORUS CONCENTRATIONS DUE TO MIXING BY MOTORBOATS IN SHALLOW LAKES,
University of Central Florida, Orlando. Engineering and Industrial Experiment Station.
Y. A. Yousef, W. M. McLellon, and H. H. Zebuth.
Water Research, Vol 14, No 7, p 841-852, July, 1980. 9 Fig, 8 Tab, 22 Ref

Descriptors: *Phosphorus, *Lakes, Chlorophyll, Boating, Productivity, Recreation, Turbidity, Dissolved oxygen, Statistical methods, Hydrogen ion concentration, Florida, Water quality, Mixing, Shallow water, Motorboats, Effects.

Changes in water quality due to mixing by motorboats were studied in shallow lakes of Central Florida. The three lakes, Lakes Claire, Mizell and Jessup, differed in average water depth, sediment characteristics and trophic state. Significant increases in turbidity and ortho- and total phosphorus concentrations were demonstrated in water samples collected after mixing by motorboats in Lakes Claire and Jessup. The results obtained from Lake Mizell were not as conclusive. The increase in the orthophosphorus content for Lakes Claire, Mizell and Jessup averaged 43, 16, and 73%; the increase in total phosphorus content for the same three lakes was 39, 28, and 55%. Positive correlations existed between turbidities and the phosphorus content in the water column. The authors also demonstratd that the rate of increase in the phosphorus content with mixing time is much higher than the rate of decline after cessation of mixing. Data indicated substantial water quality effects are possible due to recreational boating on shallow lakes. (McKeon-FRC)

SOYBEAN ROW SPACING AND SOIL WATER SUPPLY: THEIR EFFECT ON GROWTH, DEVELOPMENT, WATER RELATIONS, AND MINERAL UPTAKE,
Iowa State Univ., Ames. Dept. of Agronomy
W. K. Mason, H. M. Taylor, A. T. P. Bennie, H. R. Rowse, and D. C. Reicosky.
Science and Education Administration, Peoria, Illinois. Advances in Agricultural Technology Report AAT-NC-5, November, 1980. 63 p, 11 Fig, 33 Tab, 36 Ref.

Descriptors: *Soybeans, *Irrigation effects, *Planting management, Field crops, Agronomy, Solar radiation, Plant growth, Biomass, Nutrients, Moisture stress, Soil moisture.

The growth, development, water and nutrient use, and yield were monitored for soybeans grown in wide (1.0m) and narrow (0.25m) rows under irrigated and nonirrigated conditions to clarify why narrow row soybeans often produce greater yields. Irrigation increased plant height, leaf area, and biomass production and slowed both vegetative and reproductive development. Planting soybeans in 1.0m rows rather than 0.25m rows increased plant height, biomass production and pod number, and speeded reproductive development. The more even canopy distribution of the narrow rows resulted in greater radiation interception. With the significant increases in biomass production caused by irrigation and wide row spacing, the final seed yield results are somewhat surprising. The 0.25m row spacing significantly outyielded the 1.0m row spacing, and irrigation had no significant effect on yield except to reduce seed size. No effect of row spacing on total leaf water potential or osmotic potential was found under irrigated or nonirrigated conditions. Results indicate that yield in the irrigated plots was limited by low radiation levels, by low temperatures, or both, just before maturity, and the 0.25m rows outyielded the 1.0m rows because of greater late-season solar radiation interception. TRAP EFFICIENCY STUDY, HIGHLAND CREEK FLOOD RETARDING RESERVOIR NEAR KELSEYVILLE, CALIFORNIA, WATER YEARS 1966-77,
Geological Survey, Menlo Park, CA. Water Resources Div.
L. F. Trujillo.
Available from the OFSS, USGS Box 25425, Fed. Ctr., Denver, CO 80225, Price: $3.75 in paper copy, $3.50 in microfiche. Geological Survey Open-File Report 80-735, July, 1980. 25 p, 7 Fig, 8 Tab, 12 Ref.

Descriptors: *Trap efficiency, *Detention reservoirs, *Sediments, *California, Inflow, Discharge(Water), Water storage, Sediment transport, Particle size, Chemical analysis, Lake County(CA), Kelseyville(CA), Highland Creek Reservoir(CA).

This investigation is part of a nationwide study of trap efficiency of detention reservoirs. In this report, trap efficiency was computed from reservoir inflow and outflow sediment data and from reservoir survey and outflow data. Highland Creek Reservoir is a flood retarding reservoir located in Lake County, near Kelseyville, California. This reservoir has a maximum storage capacity of 3,199 acre-feet and permanent pool storage of 921 acre-feet. Mean annual rainfall for the 14.1-square-mile drainage area above Highland Creek Dam was 29 inches during the December 1965 to September 1977 study period. Resultant mean annual runoff was 17,100 acre-feet. Total reservoir inflow for the 11.8-year study period was 202,000 acre-feet, transporting an estimated 126,000 tons (10,700 tons per year) of suspended sediment. Total reservoir outflow for the same period was 188,700 acre-feet, including 15,230 tons (1,290 tons per year) of sediment. Estimated trap efficiency for the study period was 88%, based on estimated sediment inflow and measured sediment outflow. Reservoir surveys made in December 1965 and April 1972 revealed a storage capacity loss of 35.8 acre-feet during the 6.3-year period. Computed by using an estimated specific weight, this loss represents 54,600 tons of deposited sediment. Sediment outflow during the same period was 8,890 tons. Trap efficiency for the survey period was 86%. (USGS)

SUBMERGED HORIZONTAL JET OVER ERODIBLE BED,
Jalpaiguri Government Engineering Coll. (India).
S. S. Chatterjee, and S. N. Ghosh.
Journal of the Hydraulics Division, Proceedings of the American Society of Civil Engineers, Vol 106, No HY11, p 1765-1782, November, 1980. 9 Fig, 2 Tab, 9 Ref.

Descriptors: Velocity, *Stream erosion, *Flow, Hydraulics, Jets, Erosion, *Sediment transport, Alluvium, Shear, Boundary processes, Sediments, Friction, Geomorphology, Mathematical studies, Rates, Diffusion, Sands.

An experimental investigation of sediment transport due to horizontal jet flow over erodible sand and gravel beds is discussed. Test runs of jet flows were undertaken with two erodible beds with different grain size distributions. Using the data, the shear stress acting over the bed during the development of a scour hole was evaluated, and sediment transport was computed. From the experimental data the velocity distribution law within the boundary layer and the expression for the growth of its thickness with distance have been derived. An expression for critical shear stress was derived. At the location of maximum scour an expression for the pressure-shear relationship for a Preston tube was obtained. Results indicate that the effect of grain-size characteristics of the bed material on the development of boundary shear is increasingly felt as the equilibrium stage is approached. The growth and thickness of the boundary layer have been found to be dependent on the flow depth, grain size, and distance from the sluice opening. There is discrepancy between values calculated for the sand bed, but there is good agreement of values for the gravel bed. (Titus-FRC)

Report, 1980. 43 p, 43 Ref.

Descriptors: *Storm surges, *Model studies, *Hurricanes, Computer models, Surges, Coasts, Floods, Mathematical models, Storms, Oceans, Meteorological data, Hydrodynamics, Forecasting.

Of the many phenomena affecting the coastlines of the United States, storm surges cause the greatest damage. Techniques for accurately estimating storm surge water levels are essential to the dissemination of information to warn people of storm surges, to the design of coastal protective works, and to the reduction of economic loss and human suffering. Several numerical models are currently being used to estimate hurricane-produced storm surges, with each model having its own advocates and sphere of application. Open coast storm surge models, including the SPLASH Model, SSURGE Model, FIA Model, and BATHYSTROPHIC Model, were reviewed. A detailed model assessment was not possible, but the initial review indicated that: some models had not been adequately tested; adequate data for testing was not readily available; and the models were sufficiently different that direct comparison of algorithms could not be made. Specific recommendations which would provide the basis for a decision on the use of a particular model and could be used in future standardization efforts include: model documentation; the decoupling of storm and surge models; model calibration and verification; model selection based on simulations of historic data, sensitivity studies, and economics of model application; consideration of inland flooding and extra tropical storm modeling; and the development of a permanent system for the collection, storage, and retrieval of meteorological and surge data. MATHEMATICAL MODELING OF CIRCULATION IN BAKER BAY, WASHINGTON/OREGON,
Washington State Univ., Pullman. Dept. of Civil and Environmental Engineering.
J. A. Roberson, H. D. Copp, and B. Naik.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-177693, Price codes: A06 in paper copy, A01 in microfiche. Technical Report HY-4/80, September 30, 1980. 106 p, 19 Fig, 1 Tab, 13 Ref, 2 Append. OWRT-A-099-WASH(1), 14-34-0001-9051.

Descriptors: Computer modeling, Hydraulics, *Estuaries, *Bays, *Water circulation, Forecasting, *Baker Bay, Washington, Oregon, Model studies, *Tidal effects, *Sedimentation, Mathematical models, Columbia River.

A two-dimensional, vertically averaged, mathematical model was developed to simulate hydraulic circulation of Baker Bay at the mouth of the Columbia River in Washington/Oregon. An existing model was modified so shoal areas that become exposed during low tides would be created realistically during simulation. Baker Bay is bounded on the south of the Columbia River with two islands along this boundary. The inital conditions for a given run are the tide level and velocity (zero) for flood tides. The model must be run one complete tide cycle before circulation predictions in the bay are representative of the actual circulation. Comparison of computed velocities and depths with rather meager field data indicates the model performs adequately. The model was used to examine certain possible modifications to the bay at the boundary with the Columbia River to assess how bay circulation might change. Sediment deposition has restricted movement of commercial ships and pleasure craft into and out of the bay; more intense circulation velocities would help to maintain adequate depths in ship channels and in the bay generally. Modifications examined influenced internal circulation only slighly but some showed promise of improving velocities locally in existing channels near the bay/river boundary. Additionally, more detailed investigations are needed prior to undertaking remedial works.

TIDAL AND DIEL FLUCTUATIONS IN THE TEMPORAL CONCENTRATIONS OF CHLOROPHYLL A AND PHEOPHYTIN AT A STATION MONITORING A HIGH-MARSH CREEK,
South Carolina Univ., Columbia. Dept. of Biology.
C. W. Erkenbrecher, Jr., and L. H. Stevenson.
Journal of Experimental Marine Biology and Ecology, Vol 48, No 3, p 253-261, December, 1980. 4 Fig, 3 Tab, 14 Ref.

Descriptors: *Estuaries, *Diel migration, *Phytoplankton, Sampling, Tidal effects, Chlorophyll, Pheophytin, Temporal distribution, Solar radiation, Fluctuations, Variability, Water level fluctuations, Oyster Landing Creek, South Carolina, Pigments, Plant pigments, Marine biology.

Pheophytin level fluctuations in a high-marsh creek were strongly influenced by tides; chlorophyll a concentrations were affected by complex, superimposed tidal and diel rhythms. Sampling done in Oyster Landing Creek, North Inlet Estuary, South Carolina, during May, June, August, and October showed a mean chlorophyll a concentration of 3.02 mg per cu meter (range 0.13 to 11.44) and pheophytin, 1.77 (range 0.01 to 8.49). During May and June solar radiation caused marked increases of chlorophyll a during the day, peaking at mid-afternoon. Pheophytin levels were not similarly affected, but were correlated with the tides, minimum at high tide and maximum at low tide. Both pheophytin and chlorophyll a had a negative correlation with water depth. Therefore, tidal cycles and sampling dates are factors in planning the sampling of phytoplankton for species composition, productivity, and seasonal effects. (Cassar-FRC)

3A. Saline Water Conversion

DESALINATION: A PRACTICAL PROCESS,
National Inst. of Water Research, Pretoria (South Africa).
G. R. Botha.
Imiesa (Johannesburg), Vol 4, No 5, p 43, 45, 47, May, 1979. 2 Fig, 2 Tab.

Descriptors: *Desalination, *Desalination processes, *Distillation, *Electrodialysis, *Reverse osmosis, Freezing, Ion exchange, Membrane processes, Solar distillation, Energy requirements, Vapor compression distillation, Demineralization, Water purification, Brackish water, Saline water, Multistage flash evaporation.

Despite technological advances and the improved efficiency of desalination processes, the cost of desalination will continue to rise due to increasing energy and materials costs, making desalination

desirable only when water from conventional sources is unavailable or extremely expensive. Distillation is the oldest and most widely used desalination process, accounting for 78% of the total world capacity. Types of distillation include multistage flash evaporation, vapor compression, and solar distillation. Freezing is also recognized as a desalination process but many problems remain unsolved and the process is not yet technically or economically viable. Electrodialysis accounts for about 3% of the total world desalination capacity, however, it suffers from membrane fouling problems. Reverse osmosis represents 17% of the world capacity and offers low energy requirements and is comparatively simple. Ion exchange desalination is restricted to the preparation of boiler feed water from brackish water. The salinity of the water to be treated greatly effects the energy requirements and efficiency of the various processes. Efforts must be made to prevent the mineralization of water so that expensive desalination processes will not be increasingly needed. (Seigler-IPA)

3D. Conservation In Domestic and Municipal Use

PERCEPTION OF WATER QUALITY IN SOME VILLAGES OF THE SAVANNA ZONE OF NIGERIA,
Ibadan Univ. (Nigeria). Dept. of Geography.
F. O. Akintola, C. Acho-Chi, and S. Mark.
Water Supply and Management, Vol 4, No 4, p 243-252, 1980. 2 Fig, 6 Tab, 5 Ref.

Descriptors: *Water quality, *Rural areas, Water supply, Surveys, Water resources development, Public health, Future planning, Water management, Social aspects, Human diseases, Potable water, *Nigeria.

The water quality and supply situation of three villages of rural Savanna Nigeria were examined, and particular efforts were made to assess the inhabitants' perception of water quality to aid in the future planning of rural water supply programs. Results showed the quality of the water to be generally poor; often drinking water supplies were boiled, as the same water source may have been used for wading or laundering. There was a high incidence of water-borne diseases. The shortage of water was most prevalent during the dry season when ponds and wells, the major water sources, were very shallow. Villagers spent many hours each day fetching water from distant supply wells for domestic use. The people studied showed a keen awareness of water quality and used water from different sources for different purposes. It was recommended that the government provide more pipe-borne water supplies, wells, and boreholes to increase water supply and quality. The villagers are being encouraged to locate bathrooms, latrines, and laundry facilities far from drinking supplies. Education of the populace is also suggested to impress upon the people the value of good quality water to their personal health and hygiene. (Geiger-FRC)

A COST-BENEFIT ANALYSIS OF WATER USE RESTRICTIONS,
Johns Hopkins Univ., Baltimore, MD.
S. H. Hanke.
Water Supply and Management, Vol 4, No 4, p 269-274, 1980. 1 Fig, 1 Tab, 5 Ref.

Descriptors: *Mathematical models, *Cost-benefit analysis, Model studies, Water utilization, Water demand, Water conservation, Marginal costs, Consumptive use, Water costs, Droughts, Water shortage, *Australia, Perth(Australia).

A mathematical formula for determining cost-benefit values for water use restriction programs is presented. Data obtained on water use in Perth, Australia, for 1975-1976 are employed to test the utility of the model during periods corresponding to drought conditions when water use curtailments would have been in operation. The equations set forth are based on the assumption that a policy which yields incremental benefits greater than its incremental costs is a desirable policy and should be adopted. Calculations of marginal water costs using the model were conducted under conditions of restricted and non-restricted use. Four rules were deduced from data generated by the study concerning the economics of water use restrictions. It was concluded that water use restrictions would be uneconomical if prices were set equal to or above marginal costs. The restriction of water use according to the model would always be economical if prices were set below marginal costs and if restrictions did not reduce consumption below its proper level. Another rule of the model held that water use restrictions may or may not be economical if prices were set below marginal costs and if restrictions reduced consumption below its proper level. DOMESTIC WATER METERS IN SOUTH AFRICA,
R. M. Burle.
Municipal Engineer (Johannesburg), Vol 10, No 3, p 27, May/June, 1979.

Descriptors: *South Africa, Measurement, *Water metering, *Water conservation, Low flow, Water consumption, Accuracy, Design criteria, Domestic water, Cost effectiveness, Water loss, Leakage, Design criteria, Water meters.

South Africa is experiencing high water metering costs, large water losses, and poor control over its water due to the incompatibility between meter design and actual installation conditions. Strict Assize regulation generally specify the use of a positive displacement type of meter in the form of a positive rotary piston meter. These meters are highly accurate under 'ideal' conditions. 'Ideal' conditions seldom exist due to factors including the use of the smallest possible meter for homes to restrict water use, rising living standards and increased water consumption, and dissolved solids and grit particles in the water. To counter this problem, meter design should take into account adverse installation conditions. This will, in time, allow meter design to reflect long-term cost considerations. (Seigler-IPA)

ENERGY AND WATER CONSERVATION RESEARCH AND THE LOCAL AUTHORITY,
National Building Research Inst., Pretoria (South Africa).
T. L. Webb.
Imiesa (Johannesburg), Vol 4, No 6, p 37, 39, 41, June, 1979. 2 Fig.

Descriptors: *South Africa, *Water conservation, *Energy conservation, *Engineering personnel, Training, Building codes, Fossil fuels, Human population, Solar energy, Energy resources, Plumbing, Information dissemination.

Local town and city engineers can facilitate energy and water conservation efforts in the following ways: by applying and incorporating research findings in the areas under their control, by assisting and collaborating with research activities, and by disseminating the information gained from research. Local South African engineers are responsible for the services of 80% of the country's people and in this position they can directly aid in energy and water conservation. To achieve energy conservation of fossil fuel resources, the amount of energy used must be reduced and replaced by alternative, preferably renewable, energy sources. Three courses of action are complementary to this reduction: education of policy makers and the public, implementation of economic measures to promote conservation, and legislation to enforce conservation measures. South Africa's National Building Research Institute is guiding research areas so that the results will be meaningful and practical. (Seigler-IPA)
W81-02047

URBAN WATER ECONOMY: A MASTER PLAN,
National Building Research Inst., Pretoria (South Africa).
P. R. Crabtree.
Imiesa (Johannesburg), Vol 4, No 5, p 27-29, 31, 65, May, 1979. 1 Fig.

Descriptors: *South Africa, *Water conservation, *Municipal water, Water closets, Urinals, *Plumbing, Cities, Urbanization, Economic efficiency, Measurement, Toilets, Water utilization, Leakage, Swimming pools, Pressure reduction.

The South African Bureau of Standards and the Water Research Commission have organized a project to study the design and usage of water supply fittings and to establish criteria for the National Building Regulations in an effort to promote water savings and conservation. This project is based on the concept that water-closets and urinals have the greatest potential for reducing water consumption in buildings. Once building specifications have been determined, an approved system will be enacted to ensure that only fittings and appliances of acceptable standards are used. Codes of practice will be drawn up for plumbing and drainage in buildings; for gardens, parks, and recreational facilities; and for municipal water distribution systems. Block metering as well as individual flat metering are being studied for their conservation potential and accuracy. Pressure reduction is another conservation technique being studied. Other areas under investigation include the design of baths and basins, leakage reduction, and water consumption in private swimming pools. The need for a campaign to generate public awareness of the need for water conservation is also recognized. (Seigler-IPA)

THE EFFECT OF METERING ON URBAN WATER CONSUMPTION,
Durban City Engineer's Dept. (South Africa).
D. C. Macleod.
Municipal Engineer (Johannesburg), Vol 10, No 3, p 23-26, May/June, 1979. 1 Fig, 5 Tab.

Descriptors: *South Africa, Measurement, Water demand, *Water costs, *Water conservation, Instrumentation, Water consumption, Capital costs, Leakage, Tariffs, Urbanization, Cities, Water supply, Water rates, Water utilization, *Water metering, *Durban.

A Universal Metering Program was initiated in Durban, South Africa, in 1971 and results show an actual consumption level 40% less than the expected level of consumption. The Durban water supply system serves not only the 751,265 residents of the city itself, but it also serves numerous other areas which lie within a 27 km radius of the city. Since 1971, 61,014 meters have been installed at a cost of R2,262,863. Including out-of-city meters, there are now a total of 74,962 metered connections. Due to problems with meter size and quality, specification for meters have been issued. Three basic tariffs are applied, an in-city tariff, an out-of-city tariff, and some special bulk agreements. The large drop in consumption was not all due to metering, the economic recession had an additional depressing effect. Although the capital cost of the metering program was high, it was still less than would have been needed to expand water conservation and purification works to meet higher demands. Also, the metering cost is offset by the ability to detect serious leakage. Since consumers have adjusted to paying for water, the rate of growth of demand has returned to nearly the rate seen before the metering program. (Seigler-IPA)

3F. Conservation In Agriculture

SNOWFALL AND ITS POTENTIAL MANAGEMENT IN THE SEMIARID CENTRAL GREAT PLAINS,
Science and Education Administration, Akron, CO. Central Great Plains Research Station.
B. W. Greb
Science and Education Administration, Oakland, California. Agricultural Reviews and Manuals

ARM-W-18, December, 1980. 50 p, 10 Fig, 24 Tab, 28 Ref.

Descriptors: *Great Plains, *Snow management, *Water conservation, Semiarid climates, Snow surveys, Vegetation effects, Windbreaks, Snowmelt, Strip cropping, Winds, Wheatgrasses, Snowpacks, Crop production, Irrigation water.

In 1955, investigations were initiated at Akron, Colorado, to monitor snowfall events, to estimate the contribution of snowmelt to crop production, and to design practical systems to trap and hold wind-transported snow for water conservation. For 24 winters, measurable snowfall occurred an average of 12 times per season, totaling 32 inches of cumulative snowfall, which contained 11.9% water and averaged 3.82 inches precipitation. Seasonal variations were sometimes extreme. Data are given for storm-size distribution, snowfall by months, snowfall during the nonfrozen soil period, and the characteristics of wind-transported snowfall. Sufficient snowfall and water intake of snowmelt from drifted snow occurs to justify developing snow management systems. Snow management systems tested involved the use of short-height woodslat fences of various air porosities, grass production leeward of snow fencing, snow retention by vegetative barriers of crop stubble and perennial tall wheatgrass, and snow retention by stripcropping. Snow deposition by windbreaks was also noted. Snowmelt storage efficiencies in soil generally exceeded 60%. The tall wheatgrass barrier system deposited snow onto crop target areas, significantly enhancing crop yields. This system should be adaptable to a large part of the Great Plains north of the 39 degrees latitude where average annual snowfall exceeds 28 inches. Better snow control for both agricultural and nonagricultural areas, such as highways, is warranted. (Moore-SRC)
W81-01941

BENEFITS OF DRAINAGE AND IRRIGATION A CLAYPAN SOIL,
Illinois Univ. at Urbana-Champaign. Dept. of Agricultural Engineering.
W. D. Goetsch, and P. N. Walker.
Paper No 79-2551 presented at 1979 Winter Meeting, American Society of Agricultural Engineers, December 11-14, 1979, New Orleans, LA, 4 p, 9 Fig, 1 Tab, 3 Ref. American Society of Agricultural Engineers, St. Joseph, Michigan. OWRT B-120-ILL(2).

Descriptors: *Clays, *Impervious soils, Hardpan, *Drainage practices, *Irrigation practices, *Corn(Field), *Crop response, Crop production, Expansive soils, Cohesive soils, Drainage systems, Drainage effects, Tiles, Irrigation water, Crop yield, Agriculture, Irrigation effects, Moisture availability, Vegetable crops, Illinois, Growth rates.

This 1977-1979 study sought to determine corn yield, as well as soil moisture, plant stress, and weather-related variables, as functions of drainage practice on both irrigated and non-irrigated claypan soils to facilitate increased understandings of drainage and irrigation and their effects on claypan soils. Twenty 18m x 32m plots, each having one of ten different combinations of irrigation and drainage treatments, were studied. Irrigated plots averaged 9.1 tonnes/hectare (tph); unirrigated plots, 7.1 tph. Drainage treatments showed that surface drainage plots, surface plus subsurface plots, subsurface drainage plots, and no drainage plots averaged 9.6, 10.6, 11.2, and 1.0 tph, respectively. Any of several methods used for monitoring soil moisture could be used to indicate when irrigation water application is warranted. Greatest differences were noted for 1979 (due to low precipitation for 1977 and 1978). The 1979 data will be used primarily to build models to predict corn yield form irrigation-drainage practices and weather trends. Prediction will allow cost-benefit determination for tile drainage/irrigation on southern Illinois claypan soils. (Zielinski-IPA)
W81-01944

PLANT AND CANOPY TEMPERATURES IN CORN AS INFLUENCED BY DIFFERENTIAL MOISTURE STRESS,
Nebraska Univ., Lincoln. Dept. of Agricultural Engineering.
B. R. Gardner.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-173908, Price codes: A07 in paper copy, A01 in microfiche. Master of Science Thesis, Agricultural Meterology Progress Report 80-1, December, 1979. 119 p, 31 Fig, 10 Tab, 83 Ref, 2 Append. OWRT B-044-NEB(1).

Descriptors: *Engineering structures, *Corn(Field), *Crop response, *Temperature, *Moisture stress, *Canopy, Moisture availability, Air temperature, Soil temperature, Thermal stress, Cover crops, Irrigation practices, Irrigation water, Irrigation effects, Growth rates, Vegetable crops, Crops, Crop yield, Agriculture, Nebraska.

This study evaluated: temperature differences between stressed/non-stressed corn, optimum time-of-day to estimate maximum temperature difference, the effect of moisture stress on leaf and air temperature profiles within corn canopies, temperatures measured with an infrared thermometer versus leaf thermocouples, detectability of plant moisture status differences from minimum leaf temperatures, effectiveness of five crop temperature indices (to estimate phenological growth stage); and used canopy temperatures to estimate grain yield and seasonal water consumption in moisture stressed corn. Height differences between fully irrigated/non-irrigated plants was 50 centimeters. Average difference in mid-day canopy temperature between stressed/non-stressed areas was as large as seven degrees Centigrade. The possibility of using crop temperature measurements to evaluate effectiveness for various irrigation scheduling techniques is suggested. It was concluded that 1400 solar time was good for estimating T-max, the maximum temperature difference between stressed and non-stressed plants. The data suggested that crop temperatures can be used to assess the severity of moisture stress. (Zielinski-IPA)
W81-01948

STRATEGY FOR IRRIGATION DEVELOPMENT IN EGYPT UP TO THE YEAR 2000,
Ministry of Irrigation and Sudan Affairs, Cairo (Egypt).
E. M. A. Samaha, and M. Abu-Zeid.
Water Supply and Management, Vol 4, No 3, p 139-146, 1980.

Descriptors: Irrigation systems, *Reviews, *Nile River, Water rights, Flood plains, Deltas, Dams, *Irrigation practices, Future planning, Impoundments, Water demand, Crop production, Water resources development, Automation, Costs, *Projections, Irrigation efficiency, *Egypt.

A review of irrigation systems in Egypt from ancient times to the projected systems of the year 2000 is presented. The ancient civilizations depended upon the yearly flooding of the Nile basin to practice agriculture. To facilitate irrigation the Shadouf was employed to lift water to higher areas. This was later replaced by the water wheel, which was then mechanized by diesel or electric pumps. In the last ten years, irrigation has been rapidly expanded to meet the increasing populations of developing countries. In Egypt, the rate of development depends on technical and economic factors which are closely linked with the social habits and traditions of the nation. In view of this fact, it has been suggested that the development of irrigation in this country will proceed in three stages. The first stage involves improvement of control and distribution of irrigation water, which will take about five years to implement. Stage two concentrates on the development of field irrigation systems, which has been complicated by the number of small farms rather than larger geographical areas. The third stage will deal with the economics of irrigation development, with plans to charge each farmer for the amount of water actually used. It was projected that the second and third stages would be completed by the year 2000. It was proposed that an authority be set up to supervise affairs in field irrigation development. Recommendations were also made for national projects to take priority over field level improvements, as the latter would require more time and effort to implement. (Geiger-FRC)

CASE STUDY ON WATERLOGGING AND SALINITY PROBLEMS IN PAKISTAN,
National Engineering Services, Lahore (Pakistan).
S. M. H. Bokhari.
Water Supply and Management, Vol 4, No 3, p 171-192, 1980. 4 Tab, 12 Ref.

Descriptors: *Irrigation systems, *Pakistan, *Indus river, Water quality, Water resouces, Drainage wells, Water managemment, River basins, Land reclamation, Future planning, Saturated soils, *Irrigation practices, Salinity, Groundwater, Percolation, Social aspects, Waterlogging.

The gravity flow irrigation network of Pakistan is probably the largest on earth. It handles over 100 million acre-feet of water per year to supply an area of approximately 33 million acres. The Pakistan irrigation system is made up of 2 large dams, 20 small dams, 20 barrages and diversion weirs, over 90,000 farm outlets and 40,000 miles of irrigation channels. Many flood protection dikes and embankments and a network of surface drainage are featured in the gravity system. The system suffers from low economic output per unit of water diverted at the source due to a wide gap between supply and demand of irrigation water, excessive water losses in the system, inefficient irrigation, insufficient drainage, outmoded land and water management techniques, waterlogging and salinity, and greatly fragmented land holdings. To remedy the problems of salinity and waterlogging many projects have been undertaken, among them the Salinity Control and Reclamation Program. Socioeconomic factors add to the complexity of the problem in the face of increasing population, food deficits and the use of most of the water resources for primitive irrigation techniques. Several reclamation and groundwater projects have been undertaken, and the advice of foreign agencies has been examined to remedy the situation. Future courses of action that are planned for the Indus Basin are also discussed. (Geiger-FRC)

4. WATER QUANTITY MANAGEMENT AND CONTROL

4A. Control Of Water On The Surface

DETENTION LAKE APPLICATION IN MASTER DRAINAGE PLANNING,
Proctor and Redfern Ltd., Toronto (Ontario).
A. T. K. Fok, and S. H. Tan.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-173858, Price codes: A11 in paper copy, A01 in microfiche. In: Proceedings, Stormwater Management Model (SWMM) Users Group Meeting, 19-20 June, 1980, Toronto, Ontario, Environmental Protection Agency Report EPA 600/9-80-064, December, 1980, p 178-199. 9 Fig, 4 Tab, 2 Ref.

Descriptors: *Urban drainage, *Model studies, *Urban runoff, *Storm water, Storm runoff, Canada, Urbanization, Drainage systems, Cost analysis, Rainfall, Lakes, *Controlled drainage.

A stormwater drainage analysis carried out for the Edmonton Development area in Canada recommended the conversion of existing sloughs and depressions into a system of aesthetic urban lakes interconnected for controlled drainage. Computer models are used for simulating the various hydrologic conditions and testing the hydraulic responses within the system. The results of modelling are further used to optimize the number, size and layout of the proposed lake system with respect to

economics, design, hydraulic operation and development constraints. The best drainage alternative is the controlled release to the Kennedale Storm Sewer System with storage ponds. Based on rainfall data, the proposed 10.3 cm-day lake storage system is adequate for the whole 1700 ha Lake District. The optimum lake system is found to consist of three lakes in a balanced design, in which lake area and outflow rates are based on the respective tributary areas. Kidney shaped lakes are proposed with side slopes of 7:1 and surface areas of 1.6 and 2.0 ha at permanent water levels. During hydraulic simulation, no instability was found. (Moore-SRC)

ALTERNATIVE URBAN FLOOD RELIEF MEASURES; A CASE STUDY; CITY OF REGINA, SASKATCHEWAN, CANADA,
Theil (Paul) Associates Ltd., Brampton (Ontario).
A. M. Candaras.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-173858, Price codes: A11 in paper copy, A01 in microfiche. In: Proceedings, Stormwater Management Model (SWMM) Users Group Meeting, 19-20 June, 1980, Toronto, Ontario, Environmental Protection Agency EPA 600/9-80-064, December, 1980, p 200-211. 1 Fig, 2 Tab.

Descriptors: *Urban drainage, *Storm runoff, *Model studies, *Drainage systems, Canada, Cost analysis, Floods, Urban runoff, Sewers, *Controlled drainage, *Regina(Saskatchewan).

The City of Regina, Canada, has been plagued by frequent flooding of basements and subways within the Seventh Avenue drainage area. The Hydrograph Volume Method was used for an analysis of the existing sewer system. The system was found to be heavily overloaded for storms of a 2-year return frequency. Considerable storm water overflows occurred to the sanitary trunk at common manholes. Roof water contributions were quickly overloading the existing sanitary sewer along local streets. A restriction in the storm water flow occurs at the outlet to the Wascana Creek, both by the limited capacity of the sewer and turbulence at the junction chamber. Alternative upgrading schemes were compared. Conventional solutions, regarding the replacement and addition of sewers, were the most costly and would result in greatest inconvenience and disturbance during the construction phase. Alternatives incorporating storage proved to be the most cost-effective. The total storage alternative requires no major upgrading to the existing sewer network. Downspout disconnection is by far the most cost-effective solution for the upgrading of the existing sanitary sewer. The recommended solution calls for the elimination of all common manholes and other interconnections, with storm outlet improvements to the Wascana Creek. (Moore-SRC)
W81-01931

ANALYSIS OF A CHANCE-CONSTRAINED RESERVOIR CONTROL MODEL,
IBM Watson Research Center, Yorktown Heights, NY.
M. Sniedovich.
Water Resources Research, Vol 16, No 5, p 849-853, October, 1980. 13 Ref.

Descriptors: *Model studies, *Eisel's equation, *Reservoir design, Design, Mathematical models, Flow, Planning, Storage capacity, Reservoir storage, Reservoir releases, *Reservoir operation.

Eisel's infinite reservoir model for estimating the distribution function of reservoir storage levels under a general linear release rule is shown to overestimate the tails of the distribution function, possibly leading to unduly conservative design and operation policies. This model does not perform well in the case of a finite reservoir. Its main problem is the positive errors introduced by the use of theoretical storage levels, ignoring shortage and overflow, and allowing storage levels to take values outside the constraints of the reservoir capacity. Several numerical examples are presented to support these observations. (Cassar-FRC)

MATHEMATICAL MODEL FOR IMPROVING COMBINED SEWER SYSTEMS,
Public Works Research Inst., Ibaraki (Japan).
E. Nakamura.
Journal of the Water Pollution Control Federation, Vol 52, No 5, p 899-905, May, 1980. 11 Fig, 2 Tab, 2 Ref.

Descriptors: *Combined sewers, *Computer models, *Overflow, Runoff, Water pollution sources, Biochemical oxygen demand, Suspended solids, Chemical oxygen demand, Water storage, Japan, Hydrograph analysis, *Tokyo, Model studies.

A deterministic computer model of a combined sewer system was developed. Three pollutants were considered: 5-day 20C biochemical oxygen demand, suspended solids, and manganate chemical oxygen demand. A simulation run applied the model to a typical Tokyo community with an area of 542 ha. Hydrographs were generated using the Rippl method, and corresponding pollutographs were derived using equations in the model. Ten-year rainfall data were used. Using the model, temporary storage of the excess overflows was found to be the most effective method of reducing total discharged loads for the combined sewer system. Porous pavement was also effective for pollution control. The model program has an overflow subroutine and a treatment plant subroutine; thus the effect of any additional treatment at overflow points or at the treatment plant can be simulated. (Small-FRC)

4B. Groundwater Management

ANALYTICAL STUDY OF THE OGALLALA AQUIFER IN SHERMAN COUNTY, TEXAS, PROJECTIONS OF SATURATED THICKNESS, VOLUME OF WATER IN STORAGE, PUMPAGE RATES, PUMPING LIFTS, AND WELL YIELDS,
Texas Dept. of Water Resources, Austin.
A. E. Bell, and S. Morrison.
Report 253, September, 1980. 64 p, 18 Tab, 75 Ref, 24 Maps.

Descriptors: *Texas, *Aquifers, *Groundwater potential, *Recharge, Water supply, *Water table, Irrigation, Storage depletion, Rainfall, Precipitation intensity, Hydraulics, Water wells, Data collections, Computer programs, Digital computers, Storage coefficient, Projections, *Ogallala aquifer(TX), *Sherman County(TX).

To provide information concerning the water shortage problems in the High Plains of Texas, high-speed computers were used to conduct evaluation and projection studies of groundwater resources. Historical pumpage has been approximately eleven times the rate of natural recharge. Sherman County's total annual agricultural income of $65 million is dependent on fresh groundwater supplied by the Ogallala aquifer. Severe overdrafts threaten to deplete the aquifer to the point that it may not be economically feasible to produce water for irrigation. Water-use patterns between 1960 and 1972 were used to develop an aquifer depletion schedule. To estimate the volume of water in storage in the aquifer, an electronic digital computer constructed maps reflecting the saturated thickness of the aquifer. A computer program also calculated future saturated thickness at individual well sites. Estimates of current pumpage were obtained as were estimates of the Ogallala's well-yield. The report uses maps, charts, and tabulations to make reasonable projections about the future conditions of the Ogallala aquifer. (Garrison-Omniplan)

ANALYTICAL STUDY OF THE OGALLALA AQUIFER IN MOORE COUNTY, TEXAS, PROJECTIONS OF SATURATED THICKNESS, VOLUME OF WATER IN STORAGE, PUMPAGE RATES, PUMPING LIFTS, AND WELL YIELDS,
Texas Dept. of Water Resources, Austin.
A. E. Bell, and S. Morrison.
Report 252, August, 1980. 64 p, 18 Tab, 77 Ref, 24 Maps.

Descriptors: *Texas, *Aquifers, *Groundwater potential, *Water supply, *Recharge, *Water table, Irrigation, Computer programs, Storage coefficient, Precipitation intensity, Hydraulics, Water wells, Data collections, Rainfall, Storage depletion, *Ogallala aquifer(TX), *Moore County(TX).

This is one in a series of planned and executed county studies to alert water users and government officials to the declining groundwater resources of the Ogallala aquifer in the High Plains of Texas. Historical pumpage has exceeded 200,000 acre-feet annually, which is approximately ten times the rate of natural recharge to the aquifer in the county. Groundwater is extremely important to the county's economy, as most of the crops are irrigated with groundwater. The report contains maps, charts and tabulations which reflect estimates of the volume of water in storage in the aquifer in Moore County and the projected depletion of this supply by decade periods through the year 2020. Observations were made from existing water level wells by examining water-use patterns between 1960 and 1972. An electronic digital computer was used to construct maps which reflect the saturated thickness of the aquifer for those years, and a computer program was written to calculate future saturated thickness at individual well sites. Another purpose was to predict future overdraft consequences. However, a variety of economic and meteorological uncertainties limit these predictions to a reasonable set of general expectations. Conservation practices would additionally affect these projections. It is hoped that this study will help persuade water users to implement all possible conservation measures. (Garrison-Omniplan)
W81-02001

ANALYTICAL STUDY OF THE OGALLALA AQUIFER IN ARMSTRONG COUNTY, TEXAS, PROJECTIONS OF SATURATED THICKNESS, VOLUME OF WATER IN STORAGE, PUMPAGE RATES, PUMPING LIFTS, AND WELL YIELDS,
Texas Dept. of Water Resources, Austin.
A. E. Bell, and S. Morrison.
Report 251, August, 1980. 64 p, 18 Tab, 76 Ref, 24 Maps.

Descriptors: *Texas, *Aquifers, *Groundwater potential, *Recharge, *Water table, Rainfall, Precipitation intensity, Irrigation, Storage coefficient, Hydraulics, Water wells, Data collections, Computer programs, Digital computers, Water supply, *Ogallala aquifer, *Armstrong County(TX).

The principal source of fresh groundwater in Armstrong County is the Ogallala aquifer; however, the withdrawl of groundwater during the past three decades has been approximately two and one-half times the rate of natural recharge. If this overdraft continues, the aquifer will be depleted to the point that it may not be economically feasible to produce water to irrigate Armstrong County's crops, which yield a total annual farm income exceeding $14 million. This study was conducted to find ways to inform water users, via maps, charts and tabulation, of the groundwater depletion, and to provide information to local, state and federal officials to use in implementing plans to alleviate the water shortage problem in the High Plains of Texas. Records from existing water level

bservation wells provided the study's principal lata base, which included: (1) measurements of the lepth to water below land surface; (2) the dates hese measurements were made; and (3) the depth rom land surface to the base of the Ogallala quifer. High-speed computers were used for auto-natic data processing. Uncertainties exist about uture overdrafts related to various price and lemand factors. (Garrison-Omniplan)

OCCURRENCE AND QUALITY OF GROUND-WATER IN THE EDWARDS-TRINITY (PLA-TEAU) AQUIFER IN THE TRANS-PECOS REGION OF TEXAS,
Texas Dept. of Water Resources, Austin.
R. Rees, and A. W. Buckner.
Report 255, September, 1980. 41 p, 9 Fig, 3 Tab, 61 Ref.

Descriptors: *Texas, *Aquifers, Groundwater availability, Water supply, Water table, *Recharge, *Irrigation, Discharge measurement, Water wells, Hydraulics, Storage depletion, *Water quality, Data collections, Computer programs, *Trans-Pecos Region(TX).

With the development of large-scale irrigation, discharge from the Edwards-Trinity aquifer has exceeded recharge in most of the irrigation areas and water has been withdrawn from storage. This study surveys information since 1973, including available geologic and hydrologic data, subsurface data, water levels in wells and chemical composition of water in wells to assess groundwater use and quality. Long-term water level declines were found to be most pronounced in the central Reeves County irrigation area, in the north and south Coyanosa, and in the Fort Stockton-Leon-Belding irrigation areas of Pecos County. This decline in water levels has caused Comanche Springs and Leon Springs to stop flowing. In those parts of the aquifer that have not been developed for irrigation, such as in Terrell and southern Pecos Counties, the recharge and discharge have remained almost in equilibrium and the aquifer contributes flow to the Rio Grande and the Pecos River through seeps and springs. The quality of water within the aquifer was found to vary from less than 500 to more than 5,000 milligrams per liter of dissolved solids. It is recommended that monitoring programs be updated regularly to ensure long-term water quality and supply. (Garrison-Omniplan)

RECORDS OF WELLS, WATER LEVELS, PUMPAGE, AND CHEMICAL ANALYSES OF WATER FROM THE CARRIZO AQUIFER IN THE WINTER GARDEN AREA, TEXAS, 1970 THROUGH 1977,
Texas Dept. of Water Resources, Austin.
G. R. Elder, G. L. Duffin, and E. Rodriguez, Jr.
Report 254, September, 1980. 125 p, 4 Tab, 6 Ref, 6 Maps.

Descriptors: *Texas, *Aquifers, Water wells, water table, *Water levels, Water supply *Chemical analysis, Irrigation, Groundwater, *Water quality, Storage depletion, Utilities, Hydraulics, Data collections, Computer programs, Digital computers, *Carrizo aquifer(TX), Winter Garden area(TX).

Groundwater pumpage, water levels and chemical quality of groundwater in the Carrizo aquifer were examined by studying wells in seventeen counties in this area. The objectives of the study were to update records in groundwater pumpage and water level monitoring programs for refinement of the digital computer model and to continue monitoring water quality. Most of the water pumped from the Carrizo aquifer is used for irrigation. In 1970 the largest quantity used for irrigation was in Zavala County, while in 1971-1975 it was in Frio County. Water levels declined about 320 feet in Zavala County from 1929-1930 to 1976, while for the same period, water levels rose in Dimmit County in most of its central and eastern parts. There have been no significant changes in groundwater quality except on a local basis, such as leaks in the casing, which were remedied. In addition to mailed questionnaire responses, irrigation pumpage was determined by: (1) obtaining data from utilities regarding cubic feet of natural gas and kilowatt-hours of elctricity supplied to irrigatd farms; (2) conducting power and yield tests on selected irrigation wells; and (3) multiplying the average number of gallons produced per cubic foot and kilowatt-hours by total amount supplied by the utilities. (Garrison-Omniplan)

ANALYTICAL STUDY OF THE OGALLALA AQUIFER IN RANDALL COUNTY, TEXAS, PROJECTIONS OF SATURATED THICKNESS, VOLUME OF WATER IN STORAGE, PUMPAGE RATES, PUMPING LIFTS, AND WELL YIELDS,
Texas Dept. of Water Resources, Austin.
A. E. Bell, and S. Morrison.
Report 250, July 1980. 64 p, 18 Tab, 24 Maps.

Descriptors: *Texas, *Aquifers, *Groundwater-recharge, *Water table, Irrigation, Storage coefficient, Rainfall, Precipitation intensity, Hydraulics, Water wells, Data collections, Computer programs, Digital computers, Storage depletion, Porosity, Pumping, Drawdown, Water levels, *Ogallala aquifer(TX), *Randall County(TX).

One of a series of studies covering the declining groundwater resources of this aquifer in the High Plains of Texas. It is hoped this report will help local, State and Federal officials implement plans to alleviate the water shortage in this area. Historical pumpage in Randall County, which has numerous agribusinesses, has been about four times the rate of natural recharge to the aquifer. The principal source of fresh groundwater is the Ogallala aquifer. In Randall County, the Ogallala receives natural recharge from local precipitation and from adjoining areas; however, obtaining a reliable recharge rate is complicated by many factors. The Texas Department of Natural Resources maintains water level observation wells which provided the principal data base used in this study. Water-use patterns between 1960 and 1972 were used to develop an aquifer depletion schedule. Using these data, a computer program was written to calculate future saturated thickness at individual well sites. To estimate the volume of water in storage in the aquifer, an electronic digital computer was used to construct maps which reflect the saturated thickness of the aquifer. Estimates of current pumpage were also obtained. In calculating pumping lifts, procedures similar to those used to estimate volume of water in storage and pumpage were employed, also using the computer and the original data base. Estimates of the Ogallala's well-yield are presented, but are subject to localized geological conditions. Using maps, charts and tabulations, this report makes reasonable projections but not absolute predictions about the depletion of the Ogallala aquifer. (Atkins-Omniplan)
W81-02005

ANALYTICAL STUDY OF THE OGALLALA AQUIFER IN SWISHER COUNTY, TEXAS, PROJECTIONS OF SATURATED THICKNESS, VOLUME OF WATER IN STORAGE, PUMPAGE RATES, PUMPING LIFTS, AND WELL YIELDS,
Texas Dept. of Water Resources, Austin.
A. E. Bell, and S. Morrison.
Report 249, July 1980. 64 p, 18 Tab, 24 Maps.

Descriptors: *Texas, *Aquifers, *Groundwater-recharge, *Water table, Irrigation, Storage coefficient, Rainfall, Precipitation intensity, Hydraulics, Water wells, Data collections, Computer programs, Digital computers, Storage depletion, Drawdown, Water levels, *Ogallala aquifer(TX), *Swisher County(TX).

During the past three decades, the withdrawal of groundwater has greatly exceeded the natural recharge to this aquifer. If this continues, there will be reduced well yields and it may not be economically feasible to produce water for irrigation. Swisher County is a leading producer of agricultural crops in the State, most of which are irrigated with groundwater. Because the Southern High Plains area is hydraulically independent of adjacent areas and has little local rainfall, water withdrawn from the aquifer is not quickly replaced by natural recharge. Changes in soil and land surface accompanying large-scale irrigation may have positively affected the recharge from precipitation; however, reliable estimates are difficult to obtain because of factors such as irrigation recirculation. Water-use patterns between 1960 and 1972, determined by water level wells, were used to develop an aquifer depletion schedule. A computer was used to construct maps reflecting the saturated thickness of the aquifer for these same years, as well as to estimate volume of water in storage and to determine pumping lift. Estimates of future well-yield are projected, but these projections will be influenced by many factors. This study uses maps, charts and tabulations in an effort to persuade water users to implement all possible conservation measures so that the remaining groundwater is used most prudently. WATER-SUPPLY ASSESSMENT OF THE LARAMIE-FOX HILLS AQUIFER IN PARTS OF ADAMS, BOULDER, JEFFERSON, AND WELD COUNTIES, COLORADO,
Geological Survey, Lakewood, CO. Water Resources Div.
P. A. Schneider, Jr.
Available from the OFSS, USGS Box 25425, Fed. Ctr., Denver, CO 80225, Price: $13.50 in paper copy, $6.50 in microfiche. Geological Survey Open-File Report 80-327 (WRI), 1980. 17 p, 2 Fig, 6 Plates, 2 Tab, 12 Ref.

Descriptors: *Water supply, *Groundwater, *Water quality, *Available water, *Colorado, Potential water supply, Aquifers, Water resources development, Water utilization, Confined water, Recharge, Groundwater movement, Water wells, Potentiometric level, Water levels, Pumping, Drawdown, Aquifer characteristics, Water storage, Chemical analysis, *Laramie-Fox Hills aquifer, Coal Creek Basin(CO).

Groundwater in the Laramie-Fox Hills aquifer is a potential source of supplemental municipal water supplies for the communities of Erie, Lafayette, Louisville, and Superior in Colorado. The present water supplies for these communities are not always adequate to meet current demands. The U.S. Geological Survey made a water-supply assessment of the Laramie-Fox Hills aquifer for the U.S. Bureau of Reclamation, which is investigating and evaluating alternative sources of water for the communities. Recharge to the aquifer is mostly in the western and southwestern parts of the study area. Groundwater movement is generally from the southwest to northeast. Groundwater discharge in the study area is primarily by pumping wells. Since 1961, this pumping has caused water-level declines of about 250 to 300 feet from Broomfield to east of Erie, Colorado. Generally, water levels in other parts of the area have remained the same. The aggregate sand thickness determined from well logs ranges from 42 to 360 feet and the mean thickness is 229 feet. The volume of groundwater in storage in the study area is about 5 million acre-feet. Reported yields from 93 wells ranged from 1 to 90 gallons per minute and averaged 22 gallons per minute. Well yields tended to be larger in the areas where aggregate sand thickness is the greatest. The water generally changes from a sodium calcium bicarbonate type to a sodium calcium sulfate type as it moves through the aquifer away from the recharge areas. The maximum limit established by the U.S. Environmental Protection Agency for nitrite plus nitrate in public-water supplies was exceeded in water from three wells, the maximum limit for fluoride was exceeded in water from two wells, and the maximum limit for selenium was exceeded in water from three wells. COMPARISON OF SPRINKLER UNIFORMITY MODELS,
Colorado State Univ., Fort Collins. Dept. of Agricultural and Chemical Engineering.
R. L. Elliott, J. D. Nelson, J. C. Loftis, and W. E. Hart.
Journal of the Irrigation and Drainage Division, Proceedings of the American Society of Civil Engineers, Vol 106, No IR4, p 321-330, December, 1980. 2 Fig, 16 Ref.

Descriptors: Statistical methods, *Statistical models, *Sprinkler irrigation, Wetting, *Irrigation systems, Uniformity coefficient, Goodness-of-fit, Model studies.

This study adapted the beta distribution for the characterization of water application depths of sprinkler irrigation systems, and evaluated the goodness of fit of the linear, normal, and beta models to water application depths. Also, recommendations were developed for selecting the appropriate statistical distribution to be used in a specific situation. Linear, normal, and beta statistical models were fitted to 2450 overlapped sprinkler irrigation patterns. The deviations of the three models from the observed water distribution were compared. The beta distribution provided the best fit, but is the least practical to use. The normal model generally fit observed sprinkler distributions better than the linear model at uniformity coefficients above about 0.65. At lower uniformities, the opposite was true. If tables or equations were developed for the ready determination of irrigation performance parameters from the beta distribution, this greater accuracy could encourage its use. At present the normal model is recommended. (Small-FRC)

MODELING SUPPLEMENTAL IRRIGATION WATER DEMAND,
Tetra Tech Inc., Lafayette, CA.
J. D. Dean.
Journal of the Irrigation and Drainage Division, Proceedings of the American Society of Civil Engineers, Vol 106, No IR4, p 285-297, December, 1980.

Descriptors: *Mathematical models, *Irrigation water, *Water demand, *Supplemental irrigation, Meteorological data, Crops, Soil physical properties, Simulations.

A deterministic hydrology model, ARM-II, was modified to simulate the application to supplemental irrigation water demand. The model was modified to simulate a three-layer soil instead of a two-layer soil, because the additional layer adds the flexibility of more closely defining crop rooting depths and conceptually defines water requirements more accurately. Also, an irrigation submodel was added. Stochastic climatological models can be used alone if meteorological data covering sufficient lengths of time is available. Irrigation water demands for a corn crop grown on Cecil sandy loam soil at Watkinsville, Georgia, were simulated for two 50-year management practices. The two practices were: irrigating when soil matrix potential rose above 0.06 bar, and irrigating when soil matrix potential rose above 15 bar. The first practice required substantially more water than the second. The model can be used to investigate irrigation water demand under different climate, crop, and soil conditions. (Small-FRC)

4C. Effects On Water Of Man's Non-Water Activities

RIVER MANAGEMENT IN THE URBAN ENVIRONMENT,
R. D. Beaumont.
Municipal Engineer (Johannesburg), Vol 10, No 4, p 43-45, July/August, 1979.

Descriptors: *Urbanization, *River systems, *Urban runoff, *Flood plains, River flow, Flood control, Legislation, Building codes, Erosion rates, Scour, Channels, Stream erosion, Infiltration, Storm runoff, *Water management.

Growing urbanization threatens the natural stability of a river system by increasing the proportion of storm run-off and by increasing the intensity of flood discharge. As roads and buildings replace soil and vegetation, a relatively constant degree of permeability is reached causing increased runoff from even typical storms. This runoff requires a larger channel for its conveyance, leading to accelerated erosion of river beds and banks. Urbanization can also reduce dry weather flows and reduce groundwater amounts. This can adversely affect the stabilizing vegetation along a river. With erosion and weakened roots, small trees can be uprooted during heavy flows and carried downstream until they catch and restrict flows, causing even more damage from flooding. Urbanization has also resulted in extensive building on floodplains. Recent legislation has acknowledged the problems of rivers and urbanization but has done little to help. New attitudes and values are beginning to take hold and this should result in progress toward making urbanization less damaging to river systems. (Seigler-IPA)

CHALLENGING COMBINED SEWER PROBLEMS IN JAPAN,
Ministry of Construction, Ibaraki (Japan). Water Quality Control Dept.
M. Kuribayashi, and E. Nakamura.
Journal of the Water Pollution Control Federation, Vol 52, No 5, p 890-898, May, 1980. 7 Fig, 3 Tab, 2 Ref.

Descriptors: *Combined sewers, *Urban runoff, *Overflow, Control, Water pollution sources, Treatment facilities, Performance, Interception, Conveyance structures, Cities, Water quality, Japan.

Research carried out by the Japanese Public Works Research Institute to solve combined sewer problems is reviewed, and some examples of control measures taken by municipal governments are presented. Urban runoff management systems have been under study since 1967. Because the population density of Japanese cities is relatively high when compared with other countries, combined sewer overflow releases more untreated waste water into receiving waters. Also, supernatants from sludge handling facilities are often returned periodically to grit chambers or primary settlers. If supernatants are returned when there is discharge of primary effluent, the quality of the discharged effluent is sometimes poorer than that of plant influent. Possible control methods being studied include swirl concentrator/regulator facilities and stormwater sedimentation basins. Interceptor enlargement, upstream detention, downstream detention, and new trunk sewers are methods being tried by various municipalities. Interceptor enlargement is the most widely applied solution. SOIL EROSION BY WATER AS RELATED TO MANAGEMENT OF TILLAGE AND SURFACE RESIDUES, TERRACING, AND CONTOURING IN EASTERN OREGON,
Science and Education Administration, Pendleton, OR. Columbia Plateau Conservation Research Center.
R. R. Allmaras, S. C. Gupta, J. L. Pikul, Jr., and C. E. Johnson.
Science and Education Administration, Oakland, California, Agricultural Research Results Report ARR-W-10, February, 1980. 57 p, 9 Fig, 25 Tab, 35 Ref, 1 Append.

Descriptors: Cultivation, *Terracing, *Contour farming, *Erosion control, *Soil management, Oregon, Land forming, *Soil erosion, Wheat, Legumes, Field crops, Slopes, Runoff, Bioenergy harvest.

Soil erosion by water was estimated for combinations of three management types in the B7, B8, and B9 Major Land Resources Areas of eastern Oregon. The three management types were tillage and residue handling, terracing, and contouring. The Universal Soil Loss Equation was applied along with detailed factor information used in conservation planning. Wheat-fallow and wheat-pea sequences predominate on the tilled cropland, which constitutes about 43% of the land area. Potential soil erosion in the three Major Land Resource Areas not only differed because of differences in the rainfall and runoff energy factor, but also because of major differences in soil tolerance for soil erosion and percentage of steeper slopes. Slope steepness was the primary factor determining which combination of the three management types was needed. Soil erosion could not be held below tolerance values in the wheat-fallow sequence for slopes exceeding 20%; a combination of all three types was needed for slopes between 12 and 20%; tillage and residue handling along with contour operation sufficed on slopes of less than 12%. On slopes of less than 5%, none of the control measures was needed. The wheat-pea sequence allowed no relaxation of control measures. Erosion control measures affected the amount of residue available for bioenergy harvest; for the test area, as a whole, 50 to 70% of the residue produced is available for harvest; the proportion of harvested area from which residues can be taken ranges from 98 to 62% of harvested area. (Moore-SRC)

SEDIMENT LOSSES FROM SMALL AGRICULTURAL WATERSHEDS IN HAWAII (1972-77),
Hawaii Univ., Honolulu. Dept. of Agronomy and Soil Science.
S. A. El-Swaify, and K. R. Cooley.
Science and Education Administration, Oakland, California, Agricultural Reviews and Manuals ARM-W-17, September, 1980. 128 p, 5 Fig, 5 Tab, 26 Ref. Available from U.S. Water Conservation Laboratory, Phoenix, Arizona.

Descriptors: *Hawaii, *Soil erosion, *Agricultural watersheds, *Sugar cane, *Pineapples, Storm runoff, Sediment transport, Tropic regions, Erosion control, Roads, Rainfall intensity, Slopes, Small watersheds, Farm management.

In Hawaii, and the humid tropics in general, the magnitudes of soil loss by water erosion are acknowledged to be drastically higher than in temperate regions, but data to confirm this generalization are scarce. Results from studies on two pineapple and four sugarcane fields in Hawaii showed soil losses to be below recommended annual tolerance limits recognized by the Soil Conservation Service. If these fields are representative, this would indicate that: present farming practices are adequate to control erosion, only very large, rare events are responsible for the majority of the erosion, or sediment sources in Hawaii are rarely agricultural in origin. Analyses of storm characteristics showed that over 90% of the storms recorded at the six different locations were of the Type IA and I distribution as defined by the Soil Conservation Service. These types of storms are characterized by low intensity rainfall and are not conducive to high erosion potential. Both pineapple and sugarcane provided considerable protection only a few months after planting. On watersheds with less than 5% of the area in roads, almost all erosion occurred during, or shortly after, harvest and field preparation. On fields with greater than 5% of the area in roads, erosion occurred during almost all significant storm events, and annual erosion rates approached tolerance limits when 20% of the field was in roads. Although erosion was

observed on the steeper areas, much of the sediment was deposited on lower flat portions of the field before reaching the delivery points at which sediment sampling equipment was installed. (Moore-SRC)

5. WATER QUALITY MANAGEMENT AND PROTECTION

5A. Identification Of Pollutants

THE QUANTITATIVE AND QUALITATIVE ANALYSIS OF THE WATER SOLUBLE FRACTION OF JET FUELS,
California Univ., Berkeley. Sanitary Engineering Research Lab.
S. A. Klein, and D. Jenkins.
Water Research, Vol 15, No 1, p 75-82, January, 1981. 6 Fig, 2 Tab, 2 Ref.

Descriptors: *Separation techniques, *Fuels, *Pollutant identification, Analytical techniques, Gas chromatography, Water analysis, Chemical wastes, Water pollution, Chemical analysis, Volatility, Organic compounds, Aqueous solutions, *Jet fuels, Hydrocarbons, Solubility.

Methods for the qualitative and quantitative analysis of water soluble fractions (WSF) of hydrocarbon jet fuels that are common pollutants of aquatic systems are presented. Depending on the volatility of the WSF components, a purge-and-trap or pentane extraction technique may be used for concentration of the pollutants. In quantitative analysis, the recovery need not be 100% as long as high reproducibility can be achieved. In the qualitative detection of the WSF of hydrocarbon jet fuels, full and reproducible recovery of all components is desired. After the WSF components in the raw water samples are concentrated, gas chromatography is carried out. For WSF of JP-4 fuel, quantitation is best achieved by purge-and-trap concentration, followed by temperature programmed gas chromatography, while for Shale JP-9, pentane extraction must be used. Qualitative analysis of JP-4 and JP-8 is best accomplished by the purge-and-trap method to avoid evaporation of components and masking of peaks by the pentane solvent. Shale JP-8, however, does not give good results when subjected to qualitative analysis by the purge-and-trap procedure, due to the small amount of volatile components in this fuel. (Geiger-FRC)

CONCENTRATIONS OF RADIONUCLIDES IN LAKE ONTARIO WATER FROM MEASUREMENTS ON WATER TREATMENT PLANT SLUDGES,
Canada Centre for Inland Waters, Burlington (Ontario).
R. W. Durham, and S. R. Joshi.
Water Research, Vol 15, No 1, p 83-86, January, 1981. 2 Fig, 3 Tab, 5 Ref.

Descriptors: *Fallout, *Radioisotopes, *Pollutant identification, Sludge, Water treatment, Lake Ontario, Analytical techniques, Water pollution, Water pollution sources, Lakes, Equations, Spectrophotometry, X-ray fluorescence.

Analyses of aluminum hydroxide sludge for the calculation of radionuclides in the untreated raw water were compared with direct gammaspectral measurements of radionculides in lake water. Sludges from four plants which treated water from Lake Ontario were processed by two different methods. In the first, dried sludge samples were extracted with HCl, and aluminum levels were determined by atomic absorption spectrometry. In the second method, pelletized dried sludge was analyzed by x-ray fluorescence using a scanning electron microscope beam. Equations were applied to describe relationships between the concentration of radionuclides in raw lake water and the volume of lake water treated per kg of dried sludge. Results showed reasonably good agreement between direct and indirect methods of determining Cs137 and Ra226 in Lake Ontario water. Better agreement between results is expected when the rate of alum addition at the water treatment plant is precisely known. All the radionuclides identified at the four plants were traced to fallout from atomic weapons testing, with the exception of the naturally-occurring Be7, Ra228, and Th228. The method may not be reliable for the quantification of shorter-lived radionuclides due to the long residence times of the sludges in the settling basins. (Geiger-FRC)
W81-01985

AN AUTOMATED METHOD FOR THE DETERMINATION OF NON-IONIC SURFACTANTS IN WATER,
Water Pollution Research Lab., Stevenage (England).
K. W. Petts, and I. Sliney.
Water Research, Vol 15, No 1, p 129-132, January, 1981. 3 Fig, 4 Ref.

Descriptors: *Surfactants, *Colorimetry, Automation, *Pollutant identification, Analytical techniques, Biodegradation, Separation techniques, Water analysis.

An automated technique for the detection of non-ionic surfactants in water is described. A modified AutoAnalyzer system was used in the colorimetric analysis, which is based on the reaction of ammonium cobaltothiocyanate with the surfactants to produce a colored complex. The complex is extracted into chloroform, and its concentration is measured at 620 nanometers. The detection limit was about 0.5 milligrams/liter, with a standard deviation of 0.2 milligrams/liter at the 10 milligrams/liter level. Approximately 3 samples/hour may be analyzed by the automated system; operation overnight without attendance has proven feasible. The large aqueous-to-solvent ratio (about 25:1) needed to obtain adequate sensitivity of response to the smaller concentrations of non-ionic surfactants presents problems in maintaining the proper flow through the small bore acidflex pump tubes. However, the method may be considered suitable for biodegradability studies of ethoxylate materials and forms the basis for further research in this area. (Geiger-FRC)

SPECIES OF DISSOLVED METALS DERIVED FROM OLIGOTROPHIC HARD WATER,
Bayerische Landesamt fuer Wasserwirtschaft, Munich (Germany, F. R.).
C. Steinberg.
Water Research, Vol 14, No 9, p 1239-1250, September, 1980. 9 Fig, 2 Tab, 47 Ref.

Descriptors: *Metals, *Chelation, *Water pollution, Organic matter, Solutes, *Hardness(Water), Natural streams, *Pollutant identification, Germany, Lake Walchensee(West Germany).

Water samples were taken from a small mountain creek, Altlach, which traverses spruce and beech forests on dolomite underground in Upper Bavaria, Lake Walchensee, Germany. Trace metals and alkaline earth metals were determined by atomic absorption spectrometry. Sodium and potassium were determined by flame spectrometry. Multistage gel chromatography was used to fractionate dissolved organic carbon and associated metals including Na, K, Mg, Ca, Al, Fe, Mn, Ni, Cr, Cu, Pb, Cd, and Zn, according to their molecular sizes. All the metals were shown to be present to a measurable degree in chelated form. Of the total concentration of lead found, 97.3% of it was in chelated form. Corresponding figures for Al and Cr were 91.5 and 82.2%, respectively. In each case the metals were chelated with Fe. About 69% of all the metal chelates were represented by Mg compounds. Specific distribution patterns were identified for Pb and Mn. Pb is preferably chelated by macromolecular substances, Mn by micro ones. Cr seems to behave similarly to Pb. (Baker-FRC)

Descriptors: *Water quality, *Rivers, *Maryland, *Estuaries, *Water properties, Chemical analysis, Water temperature, Salinity, Turbidity, Dissolved oxygen, Hydrogen ion concentration, Water levels, Tidal effects, *Rhode River estuary(MD).

Water temperature, salinity, turbidity, dissolved oxygen, pH, and water level data were continuously monitored and recorded from the Smithsonian Institution pier near Annapolis, Md., from January 1976 through December 1978. Daily maximum and minimum values are tabulated and summarized, and monthly averages and extremes are presented. Water temperature ranged from 0.0 to 33.9 Celsius. Both high and low extreme values exceeded those recorded during the previous 6 years. Salinity patterns showed normal seasonal variations and were related to the Susquehanna River inflow, which controls the upper bay salinity. Salinity between 13 and 15 parts per thousand in November and December 1978 were the highest recorded over a 9-year period. Turbidity varied seasonally, with lowest values in winter and highest in spring. Dissolved oxygen ranged from 2.0 to 18.7 milligrams per liter. Large variations between summertime daily minima and maxima indicated the high state of eutrophication of the water being monitored. Hydrogen-ion activity (pH) ranged from 7.0 to 10.2 over the 3-year period. The pH changes reflect daily variation in partial pressure of carbon dioxide, which varies inversely with the dissolved oxygen. Water level variation at the monitoring site for the 3-year period was 1.89 meters, with highest water 0.59 meter above mean high water and lowest 0.83 meter below mean low water. An apparent decline of 0.07 meter below previously recorded mean high and mean low water was associated with stronger winds and a prevalance of westerly winds in February during the winter of 1976-1977. A PRELIMINARY ANALYSIS OF BACTERIAL NUMBERS AND BIOMASS IN LANGEBAAN LAGOON,
Cape Town Univ. (South Africa). Dept. of Zoology.
H. G. F. Mazure, and G. M. Branch.
Transactions of the Royal Society of South Africa, Vol 44, No 1, p 43-54, June, 1979. 5 Fig, 2 Tab, 23 Ref.

Descriptors: *South Africa, *Langebaan Lagoon, *Biomass, *Bacteria, *Sediments, Marine microor-

ganisms, Marine bacteria, Suspended solids, Seasonal, Water analysis, Aquatic microbiology, Benthic fauna, Saline water, Mud, Intertidal areas, Organic matter.

The epifluorescent indirect count method was used to analyze the bacterial numbers and biomass of the water and sediments of Langebaan lagoon, a lagoon of marine origin with no riverine input located on the west coast of South Africa. Bacteriological samples and particle samples were taken at high tide at seven different sites, while intertidal sediment samples were taken at six sites. During microscopic examination the bacteria were divided into long rods and small coccal forms, and the average size was measured for each category in a sample. Results show a decline in bacterial numbers paralleled by a decline in suspended particles from Saldanha Bay to the head of Langebaan lagoon. This correlation indicates that organic particles provide a limiting substrate for the bacteria. Bacterial biomass and zooplankton biomass are found to be comparable. Bacterial numbers and biomass in the sediments increased progressively towards the south end of the lagoon accompanied by a decrease in particle size and an increase in percentage mud and percentage organic material. The range of bacterial biomass was from 16 to 232 mg/kg of wet sediment for a mean of approximately 14.2 g/m sq, which was comparable to the biomass of benthic macrofauna. (Seigler-IPA)

USE OF EQUIVALENT BOD AS A NEW WASTE MANAGEMENT TOOL,
Kraft, Inc., Glenview, IL.
H. I. Goldsmith, and K. S. Watson.
Journal of the Water Pollution Control Federation, Vol 52, No 2, p 372-380, February, 1980. 1 Fig, 7 Tab, 13 Ref.

Descriptors: *Industrial wastes, *Dairy industry, *Food processing industry, *Biological oxygen demand, *Pollutant identification, Waste water treatment, Waste identification, Milk, Proteins, Carbohydrates, Computers, Organic wastes, Least squares method.

Using least-squares fitting of literature data, an equation to calculate equivalent biochemical oxygen demand (EBOD) was developed for food products. Although this formula is designed primarily for dairy products, it is applicable to other foods as long as the percentages of protein, fat, and carbohydrate are known. The relationship may be expressed as: EBOD = 1.031 (protein) + 0.891 (fat) + 0.691 (carbohydrate). Laboratory-determined BOD values and calculated EBOD values showed good agreement for various milk products. This tool permits improved waste management in the food industry, relating EBOD to the load found in the plant's effluent and allowing identification of wasteful operations. Use of computer technology makes it possible to apply this approach to multi-product plants. (Cassar-FRC)

GAS-CHROMATOGRAPHIC/MASS-SPECTROMETRIC ANALYSIS OF DERIVATIZED AMINO ACIDS IN MUNICIPAL WASTE WATER PRODUCTS,
North Texas State Univ., Denton. Dept. of Chemistry.
J. L. Burleson, G. R. Peyton, and W. H. Glaze.
Environmental Science & Technology, Vol 14, No 11, p 1354-1359, November, 1980. 6 Fig, 4 Tab, 33 Ref.

Descriptors: *Amino acids, *Chlorination, *Waste water, *Municipal wastes, Analytical techniques, Chromatography, Nitrogen compounds, Pollutant identification, Chemical reactions.

Twenty common amino acids in municipal waste waters were determined by gas chromatography/mass spectrometry after cation-ligand exchange and derivatization to N(O)-heptafluorobutyrylisoamyl and N(O)-heptafluorobutyryl-n-propyl esters. Recoveries ranged from 69% for glutamic acid and 80-89% for alanine, tyrosine, tryptophan, ornithine, aspartic acid, and arginine to greater than 90% for glycine, valine, threonine, serine, leucine, isoleucine, proline, cysteine, hydroxyproline, methionine, histidine, phenylalanine, and lysine. Several amino acids were chlorinated with hypochlorous acid and some reaction products characterized. Some unusual derivatives were chlorotyrosine, dichlorotyrosine, and oxindole derivatives of tryptophan. A comparison of the method used in this paper and the Beckman 120-C amino acid analyzer showed good agreement. Differences ranged from 1.4 to 48.8%. Some disagreements were shown in the determinations of cysteine, hydroxyproline, and histidine. Waste water samples, some chlorinated, from 4 cities were analyzed for free amino acids. Superchlorination of effluents effectively destroyed the amino acids. The presence of chlorotyrosine and dichlorotyrosine was confirmed. Since the toxicities of chlorinated amino acids have not been reported, further work on this subject is needed. (Cassar-FRC)

RELATIONSHIP OF VIRUSES AND INDICATOR BACTERIA IN WATER AND WASTE WATER OF ISRAEL,
Ministry of Health, Tel-Aviv (Israel). Central Virus Lab.
Y. Marzouk, S. M. Goyal, and C. P. Gerba.
Water Research, Vol 14, No 11, p 1585-1590, November, 1980. 5 Tab, 33 Ref.

Descriptors: *Viruses, *Bioindicators, *Pollutant identification, Water pollution sources, Microorganisms, Indicators, Quality control, *Israel.

Extensive monitoring of aquatic resources of Israel was undertaken to provide background data on the occurrence of enteroviruses and to determine how adequately bacteriological indicators were reflecting their presence. Samples of groundwater (99), potable water (23), sewage and grossly polluted surface water (19), surface water (8), and swimming pool water (6) were examined, making a total of 155 samples. Echovirus type 7 was the predominant virus found, followed by poliovirus 1, echovirus 6 and coxsackieviruses B2, B5, and B6. On several occasions, water that had been judged acceptable by current standards was found to contain viruses. Water samples with no detectable fecal or total coliform bacteria counts were shown to contain viruses. No statistical correlation could be detected between the occurrence of bacterial indicators and the presence of viruses in the water. Thus serious doubts were raised about the validity of the use of the indicator bacteria system to predict the virological quality of water. This is particularly true in countries with a high incidence of enteric viral disease. (Baker-FRC)

DEVELOPMENT OF THE FACTS PROCEDURE FOR COMBINED FORMS OF CHLORINE AND OZONE IN AQUEOUS SOLUTIONS,
American Univ., Washington, DC. Dept. of Chemistry.
J. Liebermann, Jr., N. M. Roscher, E. P. Meier, and W. J. Cooper.
Environmental Science and Technology, Vol 14, No 11, p 1395-1400, November, 1980. 5 Fig, 2 Tab, 16 Ref.

Descriptors: *Chlorine, *Ozone, *FACTS procedure, *Colorimetry, Water analysis, Analytical techniques, Pollutant identification.

The FACTS procedure (free available chlorine test with syringaldazine) was modified for determination of combined and total available chlorine and, with adaptation, for determination of ozone in aqueous solution. The color reaction obeyed Beer's Law over the range 0-10 mg per liter (as chlorine). The lower detection limit was 0.2 mg per liter. Color developed within 1 minute and for most samples was stable for 5 minutes. Comparison with the method for total available chlorine by amperometric titration gave a variance between the 2 sets of data of 0.643 mg per liter (as chlorine). The procedure for ozone obeyed Beer's Law from 0 to 4.5 mg per liter ozone and had a lower detection limit of 0.2 mg per liter. (Cassar-FRC)
W81-02142

SORPTION CAPACITIES OF GRAPHITIZED CARBON BLACK IN DETERMINATION OF CHLORINATE PESTICIDE TRACES IN WATER,
Rome Univ. (Italy). Ist. di Chimica Analitica
A. Bacaloni, G. Goretti, A. Lagana, B. M. Petronio, and M. Rotatori.
Analytical Chemistry, Vol 52, No 13, p 2033-2036, November, 1980. 3 Fig, 4 Tab, 17 Ref.

Descriptors: *Carbon, *Adsorption, *Pesticides, *Water analysis, Organic compounds, Tenax, Analytical techniques, *Pollutant identification, Solvents, Chlorinated hydrocarbon pesticides, Polychlorinated biphenyls.

Graphitized carbon black (surface area 100 sq meters per gram) was tested as an adsorbent for extracting trace organic pollutants from water using known concentrations of 51 organic compounds, includng organophosphorus and chlorinated pesticides, polychlorinated biphenyls (PCB), alcohols, polynuclear aromatic hydrocarbons, hydrocarbons, acids, phenols, ethers, aldehydes, ketones, and esters. Most compounds were 100% adsorbed. Exceptions were 1-hexanol, 1-heptanol, benzyl alcohol, penta- through octadecanes, acetophenone, benzaldehyde, and methyl esters of hexanoic through decanoic acids. Tests with alpha-benzene hexachloride using distilled water or drinking water, river water, and sea water showed differences in breakthrough curves depending on trace amounts of substances affecting solubility. Of 12 elution solvents, hexane-diethyl ether (1:1) proved best; the recovery was generally 100% with 50 ml eluant. PCB recovery with this solvent was 30-40%; therefore PCB interference in pesticide determinations was decreased. Comparisons with Tenax 80-100 mesh (2,6-diphenyl-p-phenylene oxide) showed that Tenax had lower retention times for several pesticides. (Cassar-FRC)

DETERMINATION OF ARENES, VINYL CHLORIDE, AND OTHER VOLATILE HALOORGANIC COMPOUNDS IN WATER AT MICROGRAM-PER-LITER LEVELS BY GAS CHROMATOGRAPHY,
New York State Dept. of Health, Albany. Div. of Labs. and Research.
R. S. Narang, and B. Bush.
Analytical Chemistry, Vol 52, No 13, p 2076-2079, November, 1980. 5 Fig, 4 Tab, 7 Ref.

Descriptors: *Trihalomethanes, *Organic compounds, *Pollutant identification, Halogenated organic compounds, Water analysis, Vinyl chloride, Analytical techniques, *Gas chromatography.

Volatile halogenated organic compounds, such as chloroform, carbon tetrachloride, trihalomethanes, and di-, tri-, tetra- and hexa- halogenated ethylenes and ethanes, were stripped from water in a closed system, transferred to an adsorbent and eluted. This method, based on Grob's system, used Poropak N in place of charcoal as the adsorbent and methanol in place of carbon disulfide as the eluant. Eluted substances were separated by gas chromatography on a 3-meter Chromosorb 102 column (volatile haloorganics), SE-30 on Gas Chrom Q (arenes), and Poropak T (vinyl chloride). Photoionization detectors were used for arenes and vinyl chloride. This procedure, suitable for semiautomatic determinations, has detection limits of 1 microgram per liter for all compounds. CHARACTERIZATION, MAGNITUDE AND IMPACT OF URBAN RUNOFF IN THE GRAND RIVER BASIN,
Ontario Ministry of the Environment, Ottawa. Water Resources Branch.
S. N. Singer, and S. K. So.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-173858, Price codes: A11 in paper copy, A01 in microfiche. In: Proceedings, Stormwater Management Model (SWMM) Users Group Meeting, 19-20 June, 1980, Toronto, Ontario, Environmental Protection Agency Report EPA 600/9-80-064, December, 1980, p 80-120. 17 Fig, 6 Tab, 10 Ref.

Descriptors: *Urban runoff, *Storm runoff, *Water pollution, Rivers, Canada, Storm water, Dissolved oxygen, Water quality, Nutrients, Phosphorus, Aquatic plants, Aquatic algae, *Grand River(Ontario).

Urban stormwater runoff has been recognized as a potential contributor of pollution to the Grand River in Ontario, Canada, and investigation of pollution from urban sources is an integral part of the basins water quality assessment program. The characteristics of urban runoff and the magnitude of the associated pollution loads from the cities of Brantford, Cambridge, Guelph, Kitchener and Waterloo are similar to those reported for other cities in Ontario. The impact of urban runoff from the five cities on the dissolved oxygen regime in the Grand River is minor. Parts of the Speed River below Guelph and certain reaches on the main Grand between Kitchener and Brantford suffer from profuse algae and plant growth during the summer and early fall period. This results in extremely low dissolved oxygen concentrations during the night due to the respiration process. High dissolved oxygen levels are observed during the day as a result of the photosynthesis process. Improvement of the dissolved oxygen regime would require the control of nutrient input, mainly phosphorus, from point and non-point sources. The nutrient input from urban runoff is small relative to agricultural diffuse sources and sewage treatment plants. Therefore priority for pollution control measures should be given to those two sources. (Moore-SRC)

A LONG-TERM DATA BASE FOR THE INVESTIGATION OF URBAN RUNOFF POLLUTION,
Technische Univ., Munich (Germany, F. R.).
W. F. Geiger.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-173858, Price codes: A11 in paper copy, A01 in microfiche. In: Proceedings, Stormwater Management Model (SWMM) Users Group Meeting, 19-20 June, 1980, Toronto, Ontario, Environmental Protection Agency Report EPA 600/9-80-064, December, 1980, p 212-233. 16 Fig, 9 Ref.

Descriptors: *Urban runoff, *Water pollution, *Data collections, *Monitoring, Storm runoff, Combined sewers, Storm sewers, Rainfall, Surface runoff, Water analysis, Biochemical oxygen demand, Chemical oxygen demand, Suspended solids, Nutrients.

Realistic conclusions concerning receiving water pollution can not be derived from rainfall-runoff measurements or simulations of singular events. This is especially true of intermittent storm runoff and the resulting storm or combined sewer overflows. An instrumentation and monitoring program collecting rainfall, runoff, outfall and overflow data has been operated since 1976 in a sequence of closely spaced intervals in two test catchments: one a combined sewer system of 1340 acres, the other a small separate system of 57 acres. For water quality, total suspended solids, biochemical oxygen demand, chemical oxygen demand, Kjeldahl-nitrogen, total phosphorus and total organic carbon were analyzed. The amount of data collected per year is considerable. In 1977 and 1978 approximately one million pieces of data were collected, and therefore data storage and retrieval had to be completely computerized. The data acquired by a small computer at the monitoring station in the larger sewer system are punched on paper tape and then fed into a data bank. All laboratory data base has not been met. Data gaps of different lengths occurred due to mulfunctioning of individual recorders, the small processor at the monitoring station, or the sampler. The gaps in the runoff data may be filled with simulation results to provide a complete data base. (Moore-SRC)

ELEMENT FLOW IN AQUATIC SYSTEMS SURROUNDING COAL-FIRED PLANTS; WISCONSIN POWER PLANT IMPACT STUDY,
Wisconsin Univ.-Madison. Inst. for Environmental Studies.
A. Andren, M. Anderson, N. Loux, and R. Talbot.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-106833, Price codes: A05 in paper copy, A01 in microfiche. Environmental Protection Agency Report EPA-600/3-80-076, July, 1980. 94 p, 28 Fig, 19 Tab, 85 Ref. R803971.

Descriptors: *Powerplants, *Fly ash, *Cooling water, *Water pollution sources, *Wisconsin, *Aquatic environment, Water quality, Coal-fired powerplants, Water chemistry, Nutrients, Hydrogen ion concentration, Waste water treatment, Chlorinated hydrocarbons, Trace elements, Copper, Dissolved oxygen.

Water quality parameters of a 192-ha cooling pond adjacent to the Columbia Generating Station, Portage, Wisconsin were investigated, including: major and minor elements, nutrients, pH, alkalinity, oxygen, chlororganics, phenols, and polyaromatic hydrocarbons. Similar parameters were also measured in the nearby fly ash discharge basin and its associated drainage stream. Except for copper concentrations, the overall water quality of the cooling basin is similar to that of many southern Wisconsin eutrophic lakes. Copper concentrations are generally below those levels thought to be toxic to aquatic life. Bottom waters may turn anoxic during late summer, causing nutrients from bottom sediments to be released to the overlying waters. Since nutrient release from bottom sediments to the water column may cause severe biological fouling problems, it is important to maintain oxygenated cooling pond waters at all times. Cooling pond water contained non-detectable levels of chlororganics and polyaromatic hydrocarbons, but bottom sediments contained measurable quantities of chlorinated phenols, phthalate esters, and polyaromatic hydrocarbons. Results from laboratory studies on dissolution and precipitation reactions of fly ash during equilibrium conditions can not be directly extrapolated to the ash basin at the Columbia Generating Station. Major element chemistry determines the reaction mechanism of fly ash dissolution by establishing solid-solution metastable equilibria. Elevated concentrations of aluminum, boron, cadmium, and copper are present in the fly ash basin at levels deemed toxic to aquatic life, and pH values are always in the range of 9 to 12. The elemental discharge from the ash basin has a negligible effect on the water quality of the Wisconsin River. (Moore-SRC)

Seasonal fluctuations in nutrient flows were studied in two watersheds with different land uses. One site is in intensive floodplain stock farming and one is in upland dairy farming with a lower livestock density. Water samples were evaluated and river flows were measured at weekly intervals over a one year period. Additional data on sewage effluent contributions, groundwater quality and rainfall were collected. The study revealed good agreement between the two watersheds in the seasonal variations and magnitude of nutrient concentrations, including silicon and orthophosphate. Concentrations of nitrate nitrogen were higher in one of the watersheds. This result is attributed to greater contributions of sewage and to differences in the upland geology. It was found that overall, orthophosphate concentrations decreased and silicon and nitrate concentrations increased with increased flow caused by storm events. (Titus-FRC)

GULF POLLUTION--UN'S OTHER WORRY,
R. Walgate.
Nature, Vol 287, No 5782, p 477, October, 1980.

Descriptors: *United Nations, *Oil pollution, *Kuwait, *Water pollution, Sewage, Water resources, Industrial wastes, Air pollution, Pollutants, Water quality, *Persian Gulf, Iraq, Iran.

The United Nations Environment Programme will assist countries in the Gulf of Kuwait area with planning and research into the sources and effects of pollutants in this fragile water supply. This body of water averages only 35 meters deep, and evaporates more water than it receives from river runoff. Little basic information exists on the Gulf's oceanography, ecology, and meteorology. Although these waters are needed for drinking, agriculture, and industry, they are exposed to many pollutants--heavy metals, noxious gases, oil, municipal sewage, and airborne dust. The institutions and equipment for pollution control have lagged behind the rapid population and industrial development. Hence, the need for research is great. (Cassar-FRC)

BEHAVIOUR OF NITRILOTRIACETIC ACID DURING GROUNDWATER RECHARGE,
Rijksinstituut voor Drinkwatervoorziening, Leidschendam (Netherlands).
J. Hrubec, and W. van Delft.
Water Research, Vol 15, No 1, p 121-128, January, 1981. 7 Fig, 2 Tab, 18 Ref.

Descriptors: *Pilot plants, *Potable water, *Artificial recharge, *Water pollution control, Aquifers, *Detergents, Surface waters, Water quality, Public health, Groundwater recharge, Heavy metals, Path of pollutants, Water pollution sources, Percolation, Movement, Netherlands, Rhine River, *Nitrilotriacetic acid.

Research on trisodium nitrilotriacetate (NTA), a constituent of many detergents, has failed to provide sufficient information on the effects of this phosphate substitute in surface and groundwater sources for drinking water supplies. In the Netherlands, about 40% of the volume of surface water

used as potable water is infiltrated in the North Sea dune area as part of its treatment. Artificial recharge of Rhine River water has also been proposed in the Veluwe area. With these factors in mind, a pilot plant study was undertaken to examine the behavior of NTA during artificial groundwater recharge of Rhine River water. The Amsterdam Water Works pilot plant tests were also designed to obtain data on the possible mobilization of heavy metals from the soil of aquifers as a consequence of the formation of NTA-metal complexes. Experimental operations were based on fairly low recharge rates and aquifer groundwater environments that were mainly anaerobic. Results indicated that complete removal of NTA during percolation could be expected for NTA levels of up to 2 mg/l in surface water, even during events of low water temperatures. The mobilization of trace elements from the aquifer during the percolation of water containing low levels of NTA was not observed and was considered improbable. (Geiger-FRC)

PARTICULATE AND DISSOLVED TRACE METALS IN LAKE ONTARIO,
National Water Research Inst., Burlington (Ontario).
J. O. Nriagu, H. K. T. Wong, and R. D. Coker.
Water Research, Vol 15, No 1, p 91-96, January, 1981. 5 Tab, 32 Ref.

Descriptors: Heavy metals, *Trace elements, *Lake sediments, *Path of pollutants, Suspended solids, *Lake Ontario, Eutrophication, Sedimentation, Water pollution, Great Lakes, Movement, Nutrients, Fluctuations, Seasonal, Turnovers, Lakes.

Samples of Lake Ontario water and sediments were collected in the spring and summer of 1978 to determine the residence times of trace metals in the lake water column. Particulate metal levels in nanograms/liter for Cu, Cd, Ni, Zn, Mn and Fe were found to be 690, 40, 180, 1690, and 2100, respectively, in the nearshore waters of this Great Lake. These concentrations were considerably greater than the particulate metal levels in the offshore waters which were, in nanograms/liter, 130 for Cu, 8 for Cd, 34 for Ni, 230 for Zn, 110 for Pb, 260 for Mn, and 9000 for Fe. In general, the amount of trace metals bound to suspended solids in the lake water was calculated to be 50-80% for Cu, 10-40% for Ni, 20-60% for Cd, and greater than 60% for Pb. The average residence time of particulate metals in the water column of Lake Ontario was calculated to be 0.5 yr from data on the standing crop of the particulate metals and their estimated rates of deposition on the lake bottom. It was suggested that the particulate organic matter may play an important role in the transport of metals to Lake Ontario sediments. The effects of algal blooms on pollutant metal deposition into lake sediments are also mentioned. (Geiger-FRC)

MOUNT ST. HELENS ASH FALL IN THE BULL RUN WATERSHED, OREGON, MAY-JUNE 1980,
Geological Survey, Portland, OR. Water Resources Div.
M. V. Shulters, and D. G. Clifton.
Geological Survey Open-File Report 80-593, July, 1980. 11 p, 5 Fig, 3 Tab, 6 Ref.

Descriptors: *Volcanoes, *Environmental effects, *Water quality, *Large watersheds, *Oregon, Water supply, Fallout, Particle-size, Water pollution sources, Path of pollutants, Weather patterns, Water chemistry, *Mount St. Helens(WA), Bull Run watersheds(OR), *Volcanic ash, Acid rain.

On May 25-26, May 30-June 2, and June 12-13, 1980, strong, high-altitude winds from the north occurred during periods of volcanic-ash eruption at Mount St. Helens in southwestern Washington. As a result, ash fell in the Bull Run watershed, Oregon, some 50 miles to the south, the principal water-supply source for the Portland area. Samples from precipitation collectors and from stream sites in the Bull Run watershed were collected on several dates during May and June 1980. Analyses were made and are tabulated for pH, conductivity, acidity, sulfate, and nitrate plus nitrite. Field pH values of the precipitation ranged from 4.0 to 5.6 pH units and the stream samples from 6.7 to 7.5 units. Particle-size analyses for ash samples collected in the Bull Run watershed and Portland, Oregon, are also shown. Volcanic events, precipitation and high-altitude speeds for northerly winds are given for May 18-June 15, 1980. (USGS)

RESPONSE OF LEAD SOLUBILITY TO DISSOLVED CARBONATE IN DRINKING WATER,
Environmental Protection Agency, Cincinnati, OH. Drinking Water Research Div.
M. R. Schock.
Journal of the American Water Works Association, Vol 72, No 12, p 695-704, December, 1980. 16 Fig, 4 Tab, 44 Ref.

Descriptors: Corrosion, *Carbonates, *Pipes, *Lead, Solubility, Water pollution sources, *Potable water, Chemical properties, Pollutants, Metals, Heavy metals, Pipelines, Water distribution systems.

A model for relating the theoretical solubility curves for lead to changes in dissolved inorganic carbonate concentration and pH at 25C is presented. Calculated results agreed well with data obtained from pipe loop solubility experiments at inorganic carbonate concentration values of 25, 100, and 200 mg per liter as CaCO3. This model increases the predicted minimum molar solubility of lead by factors up to 10,000 over those suggested by 2 previous models which ignored lead carbonate complexes. A general reversal in trend occurs with increasing carbonate concentration, and curve shapes are changed compared with previous models. Results show that there is little advantage to increasing the carbonate level beyond 30-40 mg per liter as CaCO3 in the pH range of 8-9.5. A minimum concentration of carbonate overcomes the higher solubility of lead hydroxide, but an increase in carbonate promotes formation of more soluble lead carbonate complexes. None of the pipe loop tests reduced lead concentration to below the 0.05 mg per liter maximum contaminant level at carbonate concentrations of 0 to 7,950 mg per liter as CaCO3. (Cassar-FRC)

VOLATILE HALOCARBON PRODUCTION FROM THE CHLORINATION OF MARINE ALGAL BYPRODUCTS INCLUDING D-MANNITOL,
Environmental Research Lab., Johns Island, SC. Bears Bluff Field Station.
A. M. Crane, P. Kovacic, and E. D. Kovacic.
Environmental Science and Technology, Vol 14, No 11, p 1371-1374, November, 1980. 3 Fig, 2 Tab, 30 Ref.

Descriptors: *Trihalomethanes, *Chlorination, *Marine algae, *Mannitol, Water quality, Chemical reactions, Chloroform, Organic compounds, Glycerol, Proline, Metabolism, Water pollution sources.

Three known byproducts of marine algae metabolism, D-mannitol, glycerol, and L-proline, were reacted with chlorine at molar concentrations of 0.003:0.009, 0.003:0.003, and 0.009:0.003 and pH 7 to 11.4 to investigate volatile halocarbon production. L-proline reduced Cl without concurrent production of halocarbons under all conditions. Glycerol and mannitol behaved similarly at pH 7 (4-10 micrograms per liter volatile halocarbons produced), but mannitol produced increased total volatile halocarbons (about 560 micrograms per liter) at the highest pH and highest mannitol concentration. Most of this was chloroform, with lesser amounts (16-61 micrograms per liter) of an unidentified product and traces of a third unidentified product. The mechanism of the D-mannitol reaction is believed to be ketolactone formation, followed by ring opening by chloride and the classical haloform process. (Cassar-FRC)

CONTRIBUTION OF MARINE ALGAE TO TRIHALOMETHANE PRODUCTION IN CHLORINATED ESTUARINE WATER,
Environmental Research Lab., Johns Island, SC. Bears Bluff Field Station.
A. M. Crane, S. J. Erickson, and C. E. Hawkins.
Estuarine and Coastal Marine Science, Vol 11, No 3, p 239-249, September, 1980. 6 Fig, 4 Tab, 22 Ref.

Descriptors: *Chlorophyll, *Marine algae, *Trihalomethanes, *Estuarine environment, *Chlorination, Algae, Halogenated compounds, North Edisto River, *South Carolina.

Algal metabolic byproducts other than chlorophyll were apparently responsible for trihalomethane formation upon chlorination of estuarine water from the North Edisto River, South Carolina, with sodium hypochlorite. Major trihalomethanes produced by chlorination of filtered estuarine water were bromoform ($CHBr_3$) and chlorodibromomethane ($CHBr_2Cl$). The trihalomethane production proceeded rapidly at first and, in the presence of sufficient chlorine, continued at a reduced rate. The presence of marine algae reduced or enhanced trihalomethane formation depending on species. No correlation was found between chlorophyll a concentration and halogen compound formation. However, water containing byproducts of algal metabolism, but no cells, behaved similarly to water containing cells upon chlorination. (Cassar-FRC)

GENERATION OF POLLUTING LOADS WITHIN RIVER BASINS,
National Inst. of Scientific Research, Quebec (Ontario).
D. Couillard, and D. A. Cluis.
Water Research, Vol 14, No 11, p 1621-1630, November, 1980. 3 Fig, 6 Tab, 21 Ref.

Descriptors: *Model studies, *Water pollution sources, *Land use, Water quality, Water quality control, *River basins, Path of pollutants, Water management, Urbanization, Nitrogen, Phosphorus, Nutrients, *Quebec, Hydrologic data, Networks, Saint-Francois River basin.

A water quality model was developed to estimate pollution loads along a hydrologic network based on inputs of various land uses along adjacent areas. Pollution load studies are incorporated to devise a simple production and transport scheme that may be used to estimate the quantity of pollution that may be found at any point along the hydrologic network on a daily, seasonal, or annual basis. The relative amounts of pollution produced by different contributing factors may be assessed, and the impact of various man-made changes such as urbanization, changes in livestock populations and deforestation on the origin of transported loads downstream from the affected zone may be evaluated. The model has been applied to calculate the maximum phosphorus and nitrogen concentrations along 17 simulation points within the hydrographic network of the Saint-Francois River Basin, Quebec. Results generated from the model may be useful to water resource managers in determining priority target sites for water quality improvement programs. (Geiger-FRC)

FIELD MEASUREMENT OF TRANSVERSE DIFFUSION IN UNDIRECTIONAL FLOW IN A WIDE, STRAIGHT CHANNEL,
Loughborough Univ. of Technology (England). Dept. of Civil Engineering.
A. P. Cotton, and J. R. West.
Water Research, Vol 14, No 11, p 1597-1604, November, 1980. 8 Fig, 2 Tab, 12 Ref.

Descriptors: *Model studies, *Mixing, *Dye dispersion, Channels, Mathematical models, River flow, Water quality, Estuaries, Rivers, Tracers, Diffusion, Rhodamine, Tracking techniques, Turbulence, Prototype tests, Path of pollutants.

Understanding factors which cause mixing in an open channel flow system is important to the study of pollution transport in rivers and saline intrusion in estuaries. Field studies were conducted to measure transverse diffusion coefficients in the River Rea, Birmingham, by use of a Rhodamine WT dye tracer technique. The present work done on this urban stream also focussed on determining the effect of the river flow and estimating the Lagrangian turbulence characteristics. Good dye recovery ratios and data reproducibility were obtained for a range of nearly steady discharge over straight stretches of the stream. The variation of the transverse diffusion coefficient and the dimensionless parameter (beta) with the river flow displayed a linear trend. The values of the dimensionless coefficient which were found were similar to those for other prototype investigations. (Geiger-FRC)

ELEMENTAL PARTITIONING IN AN ABOVEGROUND OIL SHALE RETORT PILOT PLANT,
Battelle Pacific Northwest Lab., Richland, WA. Physical Sciences Dept.
J. S. Fruchter, C. L. Wilkerson, J. C. Evans, and R. W. Sanders.
Environmental Science & Technology, Vol 14, No 11, p 1374-1381, November, 1980. 3 Fig, 6 Tab, 13 Ref.

Descriptors: *Pilot plants, *Trace elements, *Oil shales, *Effluents, Industrial wastes, Metals, Path of pollutants, Distillation, Fuels, Paraho, *Colorado, Elements(Chemical), Volatility, Inorganic compounds, Chemical wastes, Sulfur, Mercury.

Raw shale and effluent streams from the Paraho, Colorado, semiworks oil shale retort were analyzed for 47 elements using a variety of instrumental techniques to calculate mass balances for major and trace elements and to obtain information on their physical and chemical forms. The elements formed three groups, based on volatility. Category I includes the nonvolatiles, partitioned less than 0.01%, which may enter the entrained shale fines or exist as dissolved ionic species. Examples are Al, Ba, Ca, Cr, Mn, Na, Rb, Si, Cu, K, Mg, Mo, Pb, Sb, Sr, Th, Ti, U, V, and Zn. Category II elements, partitioned 0.01-5%, are primarily redistributed into the product shale oil and are associated with volatile metallic or organometallic compounds. This includes As, B, Co, Fe, Ni, and Se. Category III elements are partitioned more than 20%, are volatile, and include C, H, N, S, and Hg. These elements are found in the product oil and emitted gases. Sulfur is distributed as follows: retorted shale, 80.9%; product oil, 10.4%; product water, 2.5%; and gas, 12.7%. (Cassar-FRC)

FACTORS INFLUENCING THE FORMATION OF HALOFORMS IN THE CHLORINATION OF HUMIC MATERIALS,
Imperial College of Science and Technology, London (England).
C. J. Peters, R. J. Young, and R. Perry.
Environmental Science and Technology, Vol 14, No 11, p 1391-1395, November, 1980. 8 Fig, 2 Tab, 15 Ref.

Descriptors: *Trihalomethanes, *Chlorination, *Humic acids, *Fulvic acids, Chloroform, Water quality, Organic matter, Chemical reactions, Water treatment, Water pollution sources, Path of pollutants, *Thames River, England.

Humic acid and fulvic acid fractions isolated from the River Thames were chlorinated to examine haloform (as chloroform) production under conditions encountered in water treatment. Total chloroform was composed of 2 components--residual chloroform, produced from thermal decomposition of chlorinated intermediates, and dissolved chloroform. In both humic and fulvic fractions, dissolved chloroform production increased with both temperature and pH. Humic acid, which has a higher molecular weight and contains more active sites than fulvic acid, produced 1.64-1.68 times as much dissolved chloroform as did fulvic acid. Conversely, residual chloroform formation from both materials decreased with increases in pH from 7 to 9. Total chloroform formation reached a maximum between pH 7 and 8. A linear equation relates chloroform formation to chlorine consumption (all units mg per liter): Total chloroform concentration at time t = 0.022 (Initial chlorine concentration - Chlorine concentration at time T). Thus, the amount of trihalomethanes in drinking waters depends on the quality of the source water, process conditions during chlorination, pH, bromine versus chlorine balance, and storage conditions, which affect evaporative losses and decomposition of halogenated intermediates to form additional trihalomethanes. ORGANIC COMPOUNDS IN AN INDUSTRIAL WASTE WATER. THEIR TRANSPORT INTO SEDIMENTS,
Midwest Research Inst., Kansas City, MO.
V. Lopez-Avila, and R. A. Hites.
Environmental Science and Technology, Vol 14, No 11, p 1382-1390, November, 1980. 7 Fig, 8 Tab, 16 Ref.

Descriptors: *Chemical wastes, *Industrial wastes, *Organic compounds, Path of pollutants, Water pollution, Pollutants, Analytical techniques, Chemical industry, Pollutant identification, Pawtuxet River, Narragansett Bay, Water analysis, Providence River, Waste water, *Sediments, *Rhode Island.

The environmental behavior of organic chemicals contaminating water and sediments of the Pawtuxet River and Cove, Providence River, and Narragansett Bay in Rhode Island was studied after prior investigations had identified over 120 different compounds in the waste water of a small chemical specialties manufacturer located upstream. Compounds identified included benzotriazole, chlorobenzotriazole, diphenyl ether, trichlorodiphenyl ether, dibenzoazepine, triazine, phenylbutazone, phenylnaphthylamine, stearyl alcohol and BHT ester. Water levels of the compounds followed the rules of simple dilution. Analysis of fine sediment cores produced good agreement with production histories of selected compounds. Some vertical mixing of sediment layers was seen. At the further stations contaminant concentrations decreased with both depth in sediment and distance from discharge. The most lipophilic compounds were the most highly associated with the particulate matter and were found at the greatest distance from the plant. An equation was developed to predict the sediment concentration: log (concentration in waste water/sediment concentration) = b1 + b2 (distance from plant/log P), where log P expresses the octanol/water partition coefficient. HANDLING HAZARDOUS WASTE--AN UNSOLVED PROBLEM,
Environmental Defense Fund, Washington, DC.
D. J. Lennett.
Environment, Vol 22, No 8, p 6-15, October, 1980. 50 Ref.

Descriptors: *Waste disposal, *Water pollution, *Industrial wastes, *Hazardous materials, Hazards, Regulation, Legislation, Disposal, Landfills, Waste dumps, Legal aspects, Superfund bills, Resource Conservation and Recovery Act, Compensation, Penalties(Legal), Negligence, Public health, Water quality, Environmental Protection Agency.

This paper cites examples of groundwater contamination from improper disposal of hazardous wastes and discusses proposed and present legislation for hazardous waste handling and cleanup. Two Superfund bills are under serious consideration in Congress. H.R. 7020 creates a $1.2 billion fund for emergency response activity and remedial activity at top priority sites. No relief is provided for victims of releases from waste sites. The more comprehensive S.1480 proposes a $4.085 billion fund for cleaning up any hazardous substance release, compensates victims for damages, and provides for health studies and natural resource rehabilitation. Polluters are held strictly liable for cleanup and damages. Most chemical manufacturers oppose both bills, but a few favor H.R.7020. Environmentalists support S.1480. Although the Resource Conservation and Recovery Act (RCRA) became law in Oct. 1976, EPA has repeatedly failed to meet promulgation deadlines, leaving some measures still unfinalized 4 years after passage of the act. The author points out RCRA inadequacies, in addition to its incompleteness. Many toxic wastes are not yet identified as hazardous and escape regulation. The National Interim Primary Drinking Water Standards (NIPDWS) regulate only 14 substances (8 heavy metals and 6 organics). Sampling and extraction procedures for waste streams are very inadequate. Exemptions from regulations for small waste generators (less than 2,200 lbs per month), hazardous waste mixed with domestic sewage, and recycled and reused wastes ensure that much toxic material enters the environment. Interim state regulations are not uniform and fines are not punitive. Public opinion polls show that a large majority of Americans want stricter waste control even at the expense of higher cost for consumer products. (Cassar-FRC)

Bottom sampling, Instrumentation, Laboratory tests, Soil investigations, Testing procedures, Variability, Soil chemistry, Inorganic compounds, Analytical techniques, Finite element analysis, Illinois, *Illinois River.

A sediment core of material was taken from the bed of a Mississippi River tributary, the Illinois River, divided into 4 samples (A-D, ranging from upper to lower region of the core), and particle matter from each sample was characterized by mean size (2.8-5.3 microns), mass (44.1-78.1 milligrams/liter), and concentration (2.8 million to 5.1 million particles/liter). Gill props were isolated, and subsequent measurement of the effects of temperature on sediment-transport rate (mm/second) for the 4 samples were determined from dorsal to ventral border of the gill. The two samples (A and B) from the upper core regions produced a significant cilio-inhibitory effect. Elemental analysis showed slightly higher calcium in samples A and B, with significantly greater amounts of manganese and phosphorus in B. These results support the findings that the greatest chilio-inhibition occurred in region B. The sediments studied were deposited approximately in the mid-1950's, when fingernail clams disappeared from a 100-mile section of the Illinois River. Restoration of clam populations would dramatically increase fish production and diving duck activities, illustrating the importance of assessing sediment quality effects on lower organisms. In the mid-1950's, fingernail clams disappeared from a 100-mile section of the Illinois River, a Mississippi River tributary. Factors in the river and/or sediment prevent clams from recolonizing areas where they were formally abundant. Experiments showed greatest clam mortality and highest incidence of shell deformations occurred in test chambers containing the highest proportion of river water to well water. The molluscan shell consists of calcium carbonate, probably derived from metabolic carbon dioxide. This study examined the role of raw river water and well water on shell formation in the fingernail clam. Normal fingernail clams from the Keokuk Pool of the Mississippi developed bizarre shell deformation and died without reproducing after 4 weeks in well water containing a known composition of trace metals. X-ray analysis showed the principal component of the shells was calcium, in shell layers that were laid down when clams were still in the Mississippi. When clams were introduced to well water, shell calcium dropped and silicon became the predominant element, particularly in the shell deformity area. It was concluded that the Ca/Si ratio in normal portions of clam shells is almost the reverse of that in deformed shell parts. (Zielinski-IPA)

A RESEARCH STRATEGY FOR ANTICIPATING CONTAMINANT THREATS TO AQUATIC RESOURCES,
Columbia National Fisheries Research Lab., MO.
R. A. Schoettger, and J. L. Ludke.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-226657, Price codes: A12 in paper copy, A01 in microfiche.
In: Proceedings of the Third USA-USSR Symposium on the Effects of Pollutants upon Aquatic Ecosystems, July 2-6, 1979, Borok, Jaroslavl Oblast, USSR, Environmental Protection Agency Report EPA-600/9-80-034, July, 1980, p 1-17. 8 Fig.

Descriptors: *Aquatic environment, Water pollution, *Wildlife, *Research priorities, Planning, Management, Project planning, Water pollution control, Pollution abatement, Aquatic life, Forecasting, Forecasting, *Water pollution effects, *Ecosystems.

The Environmental Contaminant Evaluation Program of the Fish and Wildlife Service is emphasizing a predictive approach to identify potential contaminant problems and preventing or ameliorating adverse effects of contaminants on ecological systems. Because manpower and scientific resources are limited, the environmental research community must emphasize the necessity of placing priorities on fishery and wildlife resources. A strategy was developed that accentuates the anticipation of new or previously unrecognized pollution problems, while continuing to address old problems that remain a concern. The approach draws upon a number of different sources to assist in the identification of present and potential contaminant effects. Information and data that relate to topics of concern are reviewed by scientists and resource managers to develop an overview of a problem and to determine data needs. A research design is then formulated to provide information on the real or potential effects a contaminant may have on aquatic organisms or ecosystems. Corrective or preventive alternatives that include one or more of the following may then be recommended: legislative action to regulate or prohibit the chemical; modification of management techniques; changes in the use of certain chemicals; substitute less harmful chemicals, selection of a less harmful activity or process. The stategy insures that resource managers are involved in the process of problem identification and formulation of research design, so that the objectives and results are applicable to the actual environmental problems that confront the aquatic resources. PRINCIPLES OF ESTIMATION OF NORMAL AND PATHOLOGIC STATES OF RESERVOIRS WITH CHEMICAL POLLUTION,
Moscow State Univ. (USSR). Faculty of Biology and Soil Science.
N. S. Stroganov.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-226657, Price codes: A12 in paper copy, A01 in microfiche.
In: Proceedings of the Third USA-USSR Symposium on the Effects of Pollutants upon Aquatic Ecosystems, July 2-6, 1979, Borok, Jaroslavl Oblast, USSR, Environmental Protection Agency Report EPA-600/9-80-034, July, 1980, p 18-33. 4 Fig, 8 Ref.

Descriptors: *Water pollution, Potable water, *Aquatic life, *Limnology, *Reservoirs, *Water pollution effects, Water quality, Commercial fish, Commercial shellfish, Water utilization, Aquatic environment.

A need has been demonstrated for giving hydrobioloical principles priority over other principles in the evaluation of the status of a reservoir. Based on the requirements of a reservoir in terms of preservation of hydrobiological processes assuring pure water of good quality and productivity of valuable commercial species, the following four principles should be used as a basis for standardization of water quality in fresh surface bodies of water: priority in the use of reservoirs; sufficient self-purification; assurance of life for commercial species; suitability of water for drinking. Under all conditions, man is the main standard for evaluation of normality or abnormality of a body of water. It is not simply the number and variety of species which are important, but rather useful species and their populations and productivity; not simply the stability of the system, but rather the stability of the required quality of the system. An aquatic ecosystem may be stable both with polysaprobic pollution and with oligosaprobic pollution, but preference is given to the oligosaprobic state of a reservoir over the polysaprobic state. For aquatic organisms, a normal body of water is that which best corresponds to their physiologic and biologic peculiarities. (Moore-SRC)

THEORETICAL ASPECTS OF THE 'NORMALCY AND PATHOLOGY' PROBLEM IN AQUATIC ECOTOXICOLOGY,
Akademiya Nauk URSR, Kiev. Inst. Hidrobiologii.
L. P. Braginsky.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-226657, Price codes: A12 in paper copy, A01 in microfiche.
In: Proceedings of the Third USA-USSR Symposium on the Effects of Pollutants upon Aquatic Ecosystems, July 2-6, 1979, Borak, Jaroslavl Oblast, USSR, Environmental Protection Agency Report EPA-600/9-80-034, July, 1980, p 34-43. 9 Ref.

Descriptors: *Aquatic environment, *Toxicity, *Water pollution, *Aquatic life, Ecosystems, Entropy, Biological communities, Dominant organisms, Pathology, Water properties.

Ecotoxicology, a new trend in ecology, deals not with the individual organism response to toxic effects but with the response of the community and ecosystem, as well as the transformation of toxicants in natural ecosystems. The notions of normal and pathological states of aquatic ecosystems are closely associated with the whole complex of other ecological concepts such as preservation of homeostasis, transformation of community structure, a shift of dominant forms, disturbances of bio-geochemical cycles, system buffering, detoxification potential and, with the concept of entropy and negative entropy system. From this point of view, the study of the general problems of pathology of aquatic ecosystems is considered in the light of the second principle of thermodynamics. The consideration of the problem of detoxification of waters should then be from the view of life as a negatively entropic process, evoked by our planet to retain energy, and to prevent its dispersion into space. The analysis of aquatic ecosystem responses to toxicant effects in the light of the second principle of thermodynamics may significantly stimulate our understanding of the destructive and reduction processes and factors, determining the stability and degradation of aquatic ecosystems, and the hydrobiosphere as a whole. TRENDS IN AQUATIC TOXICOLOGY IN THE UNITED STATES: A PERSPECTIVE,
Columbia National Fisheries Research Lab., MO.
F. L. Mayer, Jr., P. M. Mehrle, Jr., and R. A. Schoettger.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-226657, Price codes: A12 in paper copy, A01 in microfiche.
In: Proceedings of the Third USA-USSR Symposium on the Effects of Pollutants upon Aquatic Ecosystems, July 2-6, 1979, Borok, Jaroslavl Oblast, USSR, Environmental Protection Agency Report EPA-600/9-80-034, July, 1980, p 44-59. 2 Fig, 1 Tab, 49 Ref.

Descriptors: *Toxicity, *Aquatic environment, *Water pollution, *Ecosystems, Pesticide residues, Pesticides research priorities, Mining, Agriculture, Forestry, Sewage disposal, Invertebrates, Aquatic plants, Fish, Pesticide toxicity.

Research approaches are changing from acute toxicity testing and residue analysis to more complex and integrated research involving chronic toxicity, clinical chemistry, and ecosystem concepts. These approaches are resulting in assessments of the environmental hazard of contaminants, sometimes even before they enter the environment, rather than in the production of acute toxicity and residue data of only limited value. Developmental research is providing better interpretation and shortcuts in toxicology. In ecosystem studies, scientists are determining what really must be measured to assess the

ype and degree of pollution; biochemical techiques are decreasing the time required for chronic oxicity studies; and plants and invertebrates are eing recognized for their importance to fish and quatic ecosystems and are being tested according-y. Recognition of the complexity of aquatic conaminant residues has led to increased emphasis on he development of integrated strategies for their etection and analysis. Research emphasis has hifted to the prediction of problems that may arise s mining, smelting and coal conversion are inreased, new methods of sewage disposal, petroeum and detergent use expands, and pesticides use hanges inforest, range, and agricultural practices. COMPARISON OF PRINCIPLES OF DEVELOPMENT AND USE OF WATER QUALITY STANDARDS IN THE USSR AND USA,
Leningrad Research Inst. of Lake River and Fishng Management (USSR).
L. A. Lesnikov.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-226657, Price codes: A12 in paper copy, A01 in microfiche. In: Proceedings of the Third USA-USSR Symposium on the Effects of Pollutants upon Aquatic Ecosystems, July 2-6, 1979, Borok, Jaroslavl Oblast, USSR, Environmental Protection Agency Report EPA-600/9-80-034, July, 1980, p 60-74. 2 Tab, 59 Ref.

Descriptors: *Water quality standards, *Toxicity, *Aquatic life, *Water pollution, *Ecosystems, Aquatic animals, Fish, Algae, Plankton, Microorganisms, Invertebrates, Water chemistry, Aquatic environment, United States, Russia.

In the USSR, about 600 sanitary-hygienic maximum permissible concentrations (MPC) have been developed for harmful substances, as well as 210 fishing industry MPC's. In the USA, reports have been published on the degree of harm of a similar number of substances, primarily from short-term experiments. In order for one nation to use data obtained by another nation it is necessary to gain some idea concerning the relative toxicity resistance of test organisms. Representatives of local aquatic fauna are used both in the USSR and in the USA. Comparison of tests on fish, algae, zooplankton, benthic invertebrates, microorganisms, and hydrochemistry indicates that, with the exception of a small number of tests, the studies in the two countries generally have the same goals, and are performed according to basically similar methods. The MPC system used in the USSR is equivalent in the nature of its scientific foundation to the concept of the water quality criterion used in the USA, while the water quality standards used in the USA are more or less equivalent to the discharge norms or maximum permissible discharges used in the USSR. A classification of the relative toxicoresistance of test organisms used in the USSR and USA can be used to compare studies on the toxicity of water pollutants. (Moore-SRC)

CHLORINATED HYDROCARBONS AS A LIMITING FACTOR IN THE REPRODUCTION OF LAKE TROUT IN LAKE MICHIGAN,
National Marine Fisheries Service, Ann Arbor, MI. Great Lakes Fishery Lab.
W. A. Willford.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-226657, Price codes: A12 in paper copy, A01 in microfiche. In: Proceedings of the Third USA-USSR Symposium on the Effects of Pollutants upon Aquatic Ecosystems, July 2-6, 1979, Borok, Jaroslavl Oblast, USSR, Environmental Protection Agency Report EPA-600/9-80-034, July, 1980, p 75-83. 2 Fig, 15 Ref.

Descriptors: *Lake trout, *Lake Michigan, *Fish reproduction, *DDE, *Polychlorinated biphenyls, *Toxicity, Chlorinated hydrocarbons, Pesticides, Fry, DDT, Fish stocking, Water pollution, Mortality, Pesticide residues, Fish physiology.

Due to an ongoing lake trout restocking program which began in 1965 in Lake Michigan, by the early 1970's, the lake trout were once again considered abundant in Lake Michigan and spawning activity was widespread. Nevertheless, no naturally produced fingerlings or older lake trout have been found in the lake during sampling. The lake trout were known to contain substantial residues of DDT and its metabolites and of polychlorinated biphenyls, but the existing levels in eggs did not significantly affect survival in eggs or of early stages of the fry. Lake Michigan lake trout fry were exposed for 6 months to DDE and polychlorinated biphenyls at levels approximating exposure received by fish, and at concentrations 5 and 25 times these values, in water and food. The final cumulative mortality of fry in the simulated Lake Michigan exposure was 40.7%, or nearly double the final cumulative mortality of the controls. At the highest combined level of polychlorinated biphenyls and DDE tested, 46.5% of the fry died. During the chronic exposure, observations were made periodically on the growth, swimming performance, predator avoidance, temperature preference, and metabolism of the fry. In general, the exposed fry showed no significant physiological effects attributable to the exposure. The current levels of polychlorinated biphenyls and DDE in the lake appear sufficient to impede the restoration of self-sustaining populations of lake trout in Lake Michigan. (Moore-SRC)

ORGANOPHOSPHORUS PESTICIDES AND THEIR HAZARDS TO AQUATIC ANIMALS,
Akademiya Nauk SSSR, Moscow. Inst. Biologii Vnutrennykh Vod.
V. I. Kozlovskaya, and B. A. Flerov.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-226657, Price codes: A12 in paper copy, A01 in microfiche. In: Proceedings of the Third USA-USSR Symposium on the Effects of Pollutants upon Aquatic Ecosystems, July 2-6, 1979, Borok, Jaroslavl Oblast, USSR, Environmental Protection Agency Report EPA-600/9-80-034, July, 1980, p 84-96. 4 Fig, 7 Tab, 25 Ref.

Descriptors: *Organophosphorus pesticides, *Toxicity, *Invertebrates, *Water pollution effects, Aquatic animals, Pesticides, Agricultural runoff, Enzymes, Animal physiology, Animal behavior, Aquatic environment.

Organochlorine pesticides have been replaced with organophosphorus pesticides on the assumption that as a result of lower persistence in the aquatic environment, organophosphorus pesticides will be of little danger to aquatic organisms. However, organophosphorus pesticides have proven to be highly toxic to the majority of species of aquatic invertebrates. The concentrations found in some bodies of water greatly exceed lethal levels for sensitive species. The intensive application of organophosphorus pesticides as a part of agricultural practices results in a periodic influx of these pesticides into bodies of water. In natural waters, pollution levels are produced which cause chronic effects on aquatic animals. This is especially dangerous because organophosphorus compounds possess an additive effect; and are poorly avoided by aquatic animals. An indicator of the effects of organophosphorus pesticides is an inhibition of cholinesterase in both acute and chronic intoxication. In pathological processes, the inhibition of cholinesterase as a target enzyme undoubtedly plays a leading role, although death occurs when the inhibition of enzymes is still incomplete. (Moore-SRC)

MONITORING CONTAMINANT RESIDUES IN FRESHWATER FISHES IN THE UNITED STATES: THE NATIONAL PESTICIDE MONITORING PROGRAM,
Columbia National Fisheries Research Lab., MO.
J. L. Ludke, and C. J. Schmitt.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-226657, Price codes: A12 in paper copy, A01 in microfiche. In: Proceedings of the Third USA-USSR Symposium on the Effects of Pollutants upon Aquatic Ecosystems, July 2-6, 1979, Borok, Jaroslavl Oblast, USSR, Environmental Protection Agency Report EPA-600/9-80-034, July, 1980, p 97-110. 4 Fig, 5 Tab.

Descriptors: *Pesticides, *Water pollution, *Fish, *Monitoring, Aquatic environment, DDT, Pesticide residues, Chlorinated hydrocarbon pesticides, Distribution, Polychlorinated biphenyls, Toxaphene, Endrin, Dieldrin, Cadmium, Lead, Mercury, Arsenic, Selenium, Freshwater fish.

Monitoring contaminants in freshwater fish has undergone a series of changes since collections began in 1967. At first, fish were collected from 50 sampling stations in the Great Lakes and major rivers throughout the United States, in the spring and again in the fall. There are now 117 stations where fish are collected for analysis of contaminant residues. About half of the stations are sampled in the fall of even-numbered years and the other half during odd-numbered years. At each trend monitoring station, three samples of five fish each are taken: two samples of a bottom-dwelling species and one of a predator species. The number of contaminants studied has increased from 8 in 1967 to more than 20 today. Residues of DDT and its metabolites in fish from the major rivers and lakes have shown a continuing downward trend. The number of sites where DDT has been observed in at least one sample has also decreased somewhat since 1970. Polychlorinated biphenyls have become virtually ubiquitous, reflecting the former widespread use of these persistent industrial compounds. Polychlorinated biphenyls occur in fish tissues most frequently and at the highest concentration in the industrial northeastern and midwestern sections of the United States. Mean toxaphene residues are increasing in freshwater fishes, and toxaphene occurs much more widely now than in past years. Nationally, average residues of dieldrin and endrin in fish tissues have remained essentially unchanged from 1970 through 1977. The fish samples collected in 1977 were analyzed for cadmium, lead, mercury, arsenic and selenium. Background levels for the metals were determined, as well as geographic areas where these levels are exceeded. (Moore-SRC)

Descriptors: *DDT, *Freshwater fish, *Pesticide residues, *Water pollution effects, DDE, DDD, Chlorinated organic pesticides, Metabolism, Daphnia, Food chains, Carp, Perches, Bream, Tubificids, Aquatic animals.

The accumulation and transformation of organochlorine pesticides, especially DDT has been well demonstrated in terrestrial and marine ecosystems, but has received little attention in freshwater ecosystems. Experimental efforts have been directed toward three major areas: a demonstration of the level of persistent pesticides in aquatic ecosystems and the organisms under examination; experiments in vitro to demonstrate the accumulation of residues of DDT and its metabolites in selected organs and tissues of fish, and to describe the development of intoxication in time; studies in experimental basins to establish accumulation and transformation of persistent pesticides at different topic levels. The following fish species were used; bream, pike perch, pike, perch, carp, crucian carp, and silver carp. The food organisms tested include tubificids and daphnia. The concentrations of DDT, DDE and DDD in water were found to be in the parts per trillion and parts per billion range. Sediment

values were in the range of parts per billion and parts per million. In freshwater fish, residual quantities of DDT and its metabolites are mainly accumulated in fatty and brain tissues. The predominance of DDE and DDD in storage indicates that DDT undergoes substantial changes. Toxicological symptoms appear in parallel with increasing levels of DDT in target organs, especially in the brain, when DDT and its metabolites accumulate up to 3 ppm in the brain tissue of fish, the fish die with obvious symptoms of cumulative toxicosis. In a food chain study it was found that tubificids metabolize DDT only to DDD; daphnia to DDD and DDE, carp to DDD and DDE, and perch and pike to DDD and DDE, but at a different ratio. (Moore-SRC)

Descriptors: *Toxicity, *Ammonia, *Fish, Temperature, Dissolved oxygen, Hydrogen ion concentration, Environmental effects, Aquatic environment, Water pollution, Rainbow trout, Water quality standards, Acclimation.

Reported acute toxicity ammonia values for a variety of species of fishes range between 0.25 and 4 mg/liter un-ionized ammonia, and other manifestations have been reported at concentrations as low as 0.01 mg/liter. Some of the factors that increase or decrease the toxicity of ammonia are considered in relation to the water quality standard for ammonia. There is evidence that fish with a history of prior acclimation to some sublethal concentration of ammonia are better able to withstand an acutely lethal concentration, at least for some period of hours and possibly days. A drop in temperature below some optimum range for a given species of fish may increase its susceptibility to ammonia toxicity. The available evidence that temperature, independent of its role in the aqueous ammonia equilibrium affects the toxicity of ammonia to fishes argues for further consideration of the relationship. For rainbow trout under bioassay conditions, there was a 30% decrease in the median lethal concentration of ammonia when the dissolved oxygen concentration dropped from 8 to 5 mg/liter. Results of tests in fish indicate that ionized ammonia may exert a heretofore unrecognized toxic effect on fish, or that the toxicity of unionized ammonia increases as the hydrogen ion concentration increases. These examples of how the many chemical and physical parameters involved in aqueous systems are interrelated in affecting the toxicity of a pollutant illustrate the complexities in establishing water quality criteria and setting standards. Descriptors: *Toxicity, *Water pollution, *Daphnia, Aquatic animals, Invertebrates, Mortality, Aquatic environment, Time, Water quality standards, Forecasting.

The increasing number of pollutants requires acceleration of the ability to assess their toxicity, and to determine acceptable levels in the environment. This requires a reduction in the length of experimental effort, and an increase in the reliability of the response. To test the reliability of acute toxicity tests for predicting the effects of pollutants, the toxic effect of some potential water pollutants was assessed by organism survival in Daphnia. Analysis of the data from this experiment indicates that the dynamics of the results of toxic influence for aquatic organisms can be shown as a combination of simpler processes. The connection of mortality with time, and the onset of given effects with concentration can best be described by power function equations. For evaluation of regression equations describing these statistically reliable relationships, 3 to 4 experimental points are necessary. These equations can be used for determination of the effects of the pollutant on the organisms for a period that exceeds the duration of observation, and for concentrations that have not been experimentally investigated, including an approximation of acceptable concentrations of the pollutant in the aquatic environment (Moore-SRC)

Descriptors: *Toxicity, *Fish, *Growth stages, *Pesticides, Fish eggs, Fry, Larvae, Water pollution, Age, Heavy metals, Phenols, Metaphos, Yalan, Propanid, Cadmium, Cobalt

Conflicting results have previously been obtained concerning the level of toxicoresistance of various stages of ontogenesis of fish, resulting from the different natures of the toxic substances studied, and the differences in mechanism of action of the organic and inorganic poisons. The dynamics of toxicoresistance was studied in embryos, larvae, and fry of rainbow trout, bream, zope, carp, Russian sturgeon, Caspian sturgeon, sterlet and giant sturgeon. The toxic substances used represented a broad range of concentrations of phenol, metaphos, yalan and propanid as well as chlorides of cadmium and cobalt. The level of toxicoresistance is found to be determined not only by the direction and intensity of metabolic processes in fish in various stages of ontogenesis, but also by the nature of the toxic agent used. The resistance of many species of fish to many organic poisons decreases with ontogenetic development and reaches a minimum in sexually mature fish. The process is not uniform, and periods of high resistance alternate with periods of low resistance. The resistance of fish to inorganic poisons, and particularly heavy metal salts, is minimal in the larval and fry periods. The increased toxicoresistance of eggs make the use of eggs as test objects undesireable in studies of the toxicity of various substances and in biological testing of natural and waste waters; larvae and fry are preferable. Environmental Protection Agency Report EPA-600/9-80-034, July, 1980, p 171-186. 11 Fig, 1 Tab, 17 Ref

Descriptors: *Great Lakes, Phosphorus, *Heavy metals, *Eutrophication, *Phytoplankton, Algae, Limnology, Water pollution, Lead, Lake Huron, Nutrients, Phosphates, Chlorophyta, Cyanophyta, Diatoms, Chrysophyta, Polyphosphate bodies, *Synergistic effects.

During an investigation of Saginaw Bay, it became apparent that certain species of phytoplankton were surviving transport out of the bay into Lake Huron, which was unexpected because the species have high nutrient requirements which cannot be satisfied in Lake Huron. Internal stores of phosphorus in the form of polyphosphate bodies were found in these populations. X-ray analysis further showed that the polyphosphate bodies also contained appreciable quantities of lead. Observations were made on natural phytoplankton assemblages collected and fixed under field conditions, natural assemblages subjected to experimental nutrient and heavy metal additions in the laboratory; and populations isolated from the lakes and maintained in the laboratory. The occurrence of polyphosphate bodies in eutrophication tolerant phytoplankton species was found to be widespread in Saginaw Bay, even in areas where the water showed low levels of dissolved phosphorus. Polyphosphate bodies were particularly apparent in cells of some of the potentially nuisance producing blue-green algae. Polyphosphate bodies were also found in green algae, diatoms, Chrysophyceae and Prymnesiophyceae. They were not found in Cryptophyceae and euglenoids. Polyphosphate accumulation may be triggered by deficiency in some critical nutrient in the presence of excess exogenous phosphorus, stress invoked by excess levels of micronutrients, or simply by the restoration of excess exogenous phosphorus to cells previously stressed by deficiency of phosphorus. Any or all of these conditions are apt to be present in mixing zones where contaminated stream flows enter the Laurentian Great Lakes. Phosphorus bound in polyphosphate bodies may be transported out into the open waters of the lakes, as may be lead. This may be an important mechanism of pollutant dispersal in the Laurentian Great Lakes. (Moore-SRC)

REVERSIBILITY OF INTOXICATION AND FACTORS GOVERNING IT,
Akademiya Nauk SSSR, Petrozavodsk. Dept. of Water Problems
I. V. Pomozovskaya
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-226657. Price codes: A12 in paper copy, A01 in microfiche. In: Proceedings of the Third USA-USSR Symposium on the Effects of Pollutants upon Aquatic Ecosystems, July 2-6, 1979, Borok, Jaroslavl Oblast, USSR. Environmental Protection Agency Report EPA-600/9-80-034, July, 1980, p 187-200. 2 Fig, 8 Tab, 9 Ref.

Descriptors: *Toxicity, *Fish, *Waste water(Pollution), Water pollution effects, Pulp wastes, Sewage effluents, Temperature, Time, Fish physiology, Aquatic environment, Growth stages, *Fish management

The possibility of reversibility of intoxication is important in predicting results for organisms that undergo short duration exposure in the polluted zone during crises, and in the case of salvo discharges. Atlantic salmon, cisco, roach, perch, and pike were exposed to both concentrated and dilute waste waters and then transfered to pure lake water after signs of intoxication appeared, in order to determine the degree of reversibility of intoxication. The study employed unpurified multi-component wastes from sulfate pulp production, sewage from sulfate pulp production, sewage from sewage treatment plants, and wastes from heat and power stations. Fish of the first year of life were used. The main sign of intoxication, which served as a

signal for transferring fish to pure water, was most often the loss of the equilibrium relfex, and a transition to the inverted state. In some cases, the fish were subjected to a sequence of two to four exposures in the waste waters. The degree and dynamics of intoxication reversibility depended upon the temperature, the concentration of toxicants, the duration of exposure, the test species, and the age of the fish. Even brief exposure to sulfate-cellulose discharges, with subsequent migration to pure water, does not guarantee fish safety, and can be especially dangerous when combined with high temperature regimes. ASPECTS OF THE INTERACTION BETWEEN BENTHOS AND SEDIMENTS IN THE NORTH AMERICAN GREAT LAKES AND EFFECTS OF TOXICANT EXPOSURES,
Michigan Univ., Ann Arbor. Great Lakes Research Div.
J. A. Robbins.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-226657, Price codes: A12 in paper copy, A01 in microfiche. In: Proceedings of the Third USA-USSR Symposium on the Effects of Pollutants upon Aquatic Ecosystems, July 2-6, 1979, Borok, Jaroslavl Oblast, USSR, Environmental Protection Agency Report EPA-600/9-80-034, July, 1980, p 201-225. 13 Fig, 3 Tab, 19 Ref.

Descriptors: *Great Lakes, *Benthos, *Sediments, *Water pollution effects, Nutrient cycling, Sediment transport, Oligochaetes, Amphipods, Lake Huron, Diptera, Larvae, Silicon.

Fine-grained sediments are both the ultimate sink and partial source of nutrients in the Great Lakes, and the life activities of the benthos are likely to be an important factor in the nutrient cycle. If the behavior, physiology, or mortality of benthos are affected by aquatic pollutants, there can be potentially novel and important effects on major nutrient cycles. To investigate the role of benthos in the transport of sediment particles, illite clay particles with adsorbed cesium-137 were added as a submillimeter layer to the surface of fine-grained sediments contained in plastic cells in a temperature regulated aquarium. A gamma detector scanned the cells at daily or weekly intervals over a period of several months to determine how oligochaete worms or amphipods transported labeled particles away from the sediment surface. The oligochaetes rework the sediments by burial, while the amphipods burrow randomly from the surface, and move the particles in a manner akin to eddy diffusion. By using both cesium-137, and the relatively conservation gamma emitting isotope sodium-22, reworking rates and molecular diffusion rates were determined simultaneously for cells with and without oligochaetes, it was found that the presence of tubificid worms at a density of about 70,000 per square meter enhances the diffusion coefficient by a factor of over three. Based on studies of benthos density and silicon flux in Lake Huron, chironomid larvae may play a major role in the regeneration of silicon from sediments, at least in shallow waters where fine-grained sediments can be found. RECENT ADVANCES IN THE STUDY OF NITRITE TOXICITY TO FISHES,
Montana State Univ. Bozeman. Fisheries Bioassay Lab.
R. C. Russo.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-226657, Price codes: A12 in paper copy, A01 in microfiche. In: Proceedings of the Third USA-USSR Symposium on the Effects of Pollutants upon Aquatic Ecosystems, July 2-6, 1979, Borok, Jaroslavl Oblast, USSR, Environmental Protection Agency Report EPA-600/9-80-034, July, 1980, p 226-240. 6 Fig, 2 Tab, 25 Ref.

Descriptors: *Toxicity, *Fish, *Nitrites, Water pollution effects, Water chemistry, Hydrogen ion concentration, Nitrous acid, Rainbow trout, Growth stages, Chlorides, Calcium, Sea water, Methemoglobinemia.

Nitrite is produced as an intermediate product in the nitrification process and under some circumstances may be present in natural waters at levels high enough to be deleterious to freshwater life. Concentrations as low as 0.2 mg/l nitrite-nitrogen are acutely lethal to several species of fish, while some species can tolerate short-term exposures to concentrations of 67 to 100 mg/l. In 20 96-hour nitrite bioassays on rainbow trout over the size range 2 to 387 g, no relationship between fish size and susceptibility to nitrite was found. A significant reduction in nitrite toxicity results from increased levels of chloride ion, and other anions also exhibit, in different degrees, an inhibitory effect on nitrite toxicity. Calcium and seawater also decrease the toxicity of nitrite. An additional factor that should be considered is the pH of the solution. The toxicity of nitrite to rainbow trout was studied over the pH range 6.4 to 9.0 to examine the effect of pH, and to determine whether toxicity could be attributed to the nitrous acid concentration. Results suggest that neither chemical species alone is responsible for the entire toxicity. The toxicity of nitrite decreases with increasing pH. Methemoglobinemia is considered to be one mechanism by which nitrite is toxic to fishes, but it is probably not the only mode of toxic action. (Moore-SRC)

The role of cytoplasmic calcium (Ca) concentration in producing lateral ciliary arrest was examined. Lateral cilia on the gill of the title fingernail clam normally have a metachronal rhythm beat. This rhythm is maintained or restored in the presence of 10.0 millimolar (mM) calcium chloride, or 15 mM potassium or sodium chloride. Lateral ciliary arrest occurred when the gill perfusion contained 10 mM calcium chloride and 0.01 mM (small clams) or 0.001 mM (large clams) of A23187, a calcium ionophore. Arrest was not produced in either calcium chloride or ionophore and monovalent cations alone. The results demonstrated the important role of intracellular Ca concentration on the behavior of lateral cilia. The physiological significance seems to be momentary or complete shut-down of water currents under unfavorable environmental conditions. The sensitivity to Ca membrane permeability appears to increase with age of animal. The clams were taken from Keokuk Pool of the Mississippi River. (Zielinski-IPA)

Electrical stimulation of the bronchial nerve has been shown to activate lateral cilia by release of cilio-excitatory 5-hydroxytryptamine (5-HT). This nerve also appears to contain axons with 3, 4-dihydroxyphenylethylamine (DA) which functions as an inhibitory neurotransmitter. The present study examined the effect of calcium (Ca) on endogenous and exogenous presence of the 5-HT and DA neurotransmitters. Lateral ciliary activity (CA) was studied on isolated visceral ganglion/bronchial nerve/gill preparations of this mussel. Bronchial nerve stimulation with 5 pulses/second (PPS) and 5-HT perfusion each accelerated ciliary beating; stimulation with 50 PPS and DA perfusion each inhibited CA. A decrease in external free Ca ion concentration or interference with Ca membrane permeability blocked nerve stimulation (low and high frequency), and subsequent endogenous release of neurotransmitters. Exogenous application of 5-HT and DA was not blocked by manipulation of Ca concentrations or Ca membrane interactions. It was concluded that Ca plays a critical role in regulation of presynaptic nerve terminal release of 5-HT and DA. (Zielinski-IPA)

Cilio-inhibition (CI) had been reported to occur in response to continuous stimulation of the bronchial nerve, manifested by a gradual decline in the rate of beating. It was recently shown that both high frequency and visible (490 nm) light release dopamine (DA) which leads to tranformations in yellow-carotino-protein (neuronal pigment), and that pentyleneterazole (PTZ) markedly depleted lipochondria of calcium (Ca). The present study sought to demonstrate whether high frequency (50 Hz), visible light, DA and PTZ produce CI by causing release of sequestered Ca from lipochrondia. Lateral ciliary activity was observed in intact and isolated cell preparations. High frequency electrical stimulation, DA, PTZ and visible light produced CI. CI produced by high frequency stimulation and photoactivation were blocked by ethylene glycol-bio(amino-ethyl ether)-N1,N2-tetracetic acid (EGBTA) and lanthanum. DA and PTZ caused a similar gradual CI as observed with high frequency stimulation and photoactivation, but DA and PTZ were not blocked by EGBTA and lanthanum. All of the CI agents studied seemed to increase cellular Ca concentration causing normal dense granules containing Ca to alter into membranous granules with subsequent release of Ca. (Zielinski-IPA)

HEAVY METALS AND MARINE DIATOMS: INFLUENCE OF DISSOLVED ORGANIC COMPOUNDS ON TOXICITY AND SELECTION FOR METAL TOLERANCE AMONG FOUR SPECIES,
Victoria Ministry for Conservation, Queenscliff (Australia). Marine Science Lab.
N. S. Fisher, and D. Frood.
Marine Biology, Vol 59, No 2, p 85-93, 1980. 2 Fig, 7 Tab, 66 Ref.

Descriptors: *Heavy metals, *Diatoms, *Resistance, Copper, Zinc, Cadmium, Organic compounds, Toxicity, Aquatic plants, Metals, Chelation, Water pollution effects, Marine plants, Phytoplankton, Corio Bay(Australia), Hobson's Bay(Australia), Bass Strait(Australia), *Australia.

Clones from diatoms living in waters chronically contaminated with heavy metals were generally less tolerant of copper, zinc, and cadmium additions than clones from the same species living in cleaner waters. Organic compounds dissolved in the 'dirty' water mediated the toxic effects of the metals. 'Dirty' water clones were especially subject to metal toxicity when in 'clean' water which contained low levels of dissolved organic compounds. Four species were tested in the heavy metal contaminated waters of Corio Bay, Australia, and of the relatively clean water Bass Strait. Copper was the most highly chelated and toxic; cadmium the least chelated and toxic. (Cassar-FRC)

EPIPELIC ALGAL COMMUNITIES IN A EUTROPHIC NORTHERN LAKE CONTAMINATED WITH MINE WASTES,
Alberta Environmental Center, Vegreville.
J. W. Moore.
Water Research, Vol 15, No 1, p 97-105, January, 1981. 2 Fig, 3 Tab, 32 Ref.

Descriptors: *Algae, *Water pollution effects, *Mine wastes, Water pollution, Eutrophication, Biological communities, Lakes, Heavy metals, *Lake sediments, Canada, Subarctic, Bioindicators, *Eutrophic lakes, Canada, Thompson(Alberta).

The impact of contaminated sediments on the density, species composition and diversity of benthic algal communities was examined in a small lake (Thompson Lake) located in the Canadian subarctic. Investigations were carried out at different sampling stations from April to November of 1978. Sediments in this shallow, eutrophic lake had become contaminated with wastes from gold mining activities on the southeast shore which were conducted from 1941 to 1949. Near the former mine site, total mercury, copper, lead and zinc averaged 440, 85, 30, and 115 milligrams/kilogram, respectively, but their concentrations decreased rapidly as distance from the mine increased. At distances of 2.1-3.0 km from the mine, levels of these metals were similar to background readings. Algal densities in the areas of heaviest contamination were only 50% of those found in other sites of the lake. Differences were also noted in the main species of algae found near the mine zone and algae sampled at stations 1.1-3.0 km away. Seasonal growth patterns were generally uniform throughout the lake. It was concluded that long term effects of mine wastes on epipelic algae were possible in northern aquatic systems and were similar to those observed in temperate zone lakes. However, no species or group of species could be designated as bioindicators of lake pollution by heavy metals. (Geiger-FRC)

CHANGES IN THE DENSITY OF ZOOPLANKTON PASSING THROUGH THE COOLING SYSTEM OF A POWER-GENERATING PLANT,
Australian Atomic Energy Commission, Sutherland.
R. D. Simpson, and A. Dudaitis.
Water Research, Vol 15, No 1, p 133-138, January, 1981. 3 Fig, 3 Tab, 12 Ref.

Descriptors: *Zooplankton, *Aquatic populations, *Cooling water, Copepods, Water temperature, Australia, *Electric powerplants, Water cooling, Water pollution sources, *Ecology, Environmental effects, Mollusks, Non-consumptive use, Intakes, Outlets.

Since zooplankton are important organisms in aquatic food chains, the effects of electric power plant cooling systems on these aquatic species have been investigated. A method was devised to sample the number and species types of plankton throughout the water column at the inlet and outlet of a power generating plant cooling system to determine if differences occurred as a result of cooling water intake operations. The technique was applied at a New South Wales coastal power station which is situated on a lake system consisting of Lake Munmorah and Lake Tuggerah, with an outlet to the sea. Specimens of copepods, copepod nauplii, barnacle nauplii, and bivalve larvae were collected by raising and lowering a net sampler through the water column. No significant changes in copepod densities were recorded after passage through the cooling system. Copepod nauplii and bivalve larvae became less abundant and barnacle nauplii more abundant after passage through the cooling system. These findings were attributed to the great rate of attachment of barnacles (which produce the nauplii) to both the inlet and outlet canals and the upsetting of copepod nauplii and bivalve larvae by the mechanical action of the pumping units. (Geiger-FRC)

RESPONSES OF SUBMERSED VASCULAR PLANT COMMUNITIES TO ENVIRONMENTAL CHANGE,
East Carolina Univ., Greenville, NC. Dept. of Biology.
G. J. Davis, and M. M. Brinson.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-164923, Price codes: A05 in paper copy, A01 in microfiche. Fish and Wildlife Service, Biological Services Program Report FWS/OBS-79/33, August, 1980. 79 p, 9 Fig, 4 Tab, 136 Ref, 2 Append. 14-16-0009-78-032.

Descriptors: *Submerged plants, *Aquatic plants, *Aquatic environment, *Light, *Turbidity, Eutrophication, Light penetration, Water pollution effects, Secchi disks, Depth, Lakes, Photosynthesis, Light intensity.

Submersed vascular plants are native to many aquatic ecosystems where they influence a number of ecosystem processes and provide food and shelter for fish and wildlife. The response of submersed vascular plants to the following environmental conditions was reviewed: fluctuating water levels, currents and waves, suspended sediments, growing season, dormancy, nutrient availability, plant-animal interactions, and light conditions. Data were assembled on depth distribution records of submersed angiosperms and the Secchi transparencies of water for mostly North American lakes. Laboratory and field studies generally show that most shade tolerant species have a rapid photosynthetic response to increasing light in the low range of intensities. In clear shallow waters, the competitive advantage is shifted toward species in which photosynthesis is saturated only by extremely high light intensities. Further analysis of depth distribution patterns of species and water transparency allowed identification of turbidity tolerant and non-tolerant species. Based on long term studies of northern lakes, a survival index for submersed species was developed. The possible effects of human activities on alterations in aquatic ecosystems and an array of impacts on submersed plant communities are considered. (Moore-SRC)

FEEDING IN ZOOPLANKTON,
C. H. D. Magadza.
The Zimbabwe Rhodesia Science News, Vol 13, No 7, p 163-164, July, 1979.

Descriptors: *Africa, *Eutrophication, *Zooplankton, *Aquatic algae, Chydorus, Daphnia, Scenedesmus, Microcystis, Nutrients, Lake stages, Biomass, Particle size, Microorganisms, Water pollution.

The hypothesis that one possible result of increased nutrient levels in water is the formation of algal colonies which are too large for filter feeding zooplankton was tested using cultures of Daphnia and Chydorus. Both single and mixed algal populations were exposed to the animals to determine the various size ranges that they are capable of filtering. A Coulter Counter was used to determine algal number and particle size. Chydorus was able to cope with particles ranging from 2 to just under 4 microns with small particles being preferred. Chydorus was almost unable to filter a culture of Scenedesmus which has a size range of 12 to 30 microns. Daphnia preferred particles ranging from 15 to 25 microns. A mixed population of Chydorus and Daphnia were also exposed to Microcystis, an algae causing major problems in Lake Mcllwaine in Africa. Both animals were unable to utilize Microcystis to any significant degree. The broad impressions of these preliminary results support the pattern of increasing algal numbers and declining zooplankton numbers in eutrophic waters. (Seigler-IPA)

WATERBORNE DISEASE: OCCURRENCE IS ON THE UPSWING,
Health Effects Research Lab., Cincinnati, OH.
E. C. Lippy
Journal of the American Water Works Association, Vol 73, No 1, p 57-62, January, 1981. 2 Fig, 2 Tab, 9 Ref.

Descriptors: *Public health, *Epidemiology, *Diseases, *Water pollution, Human diseases, Potable water, Recreation, Sewage effluents, Water purification, Chlorination, Water quality, Water pollution sources, Brevard, North Carolina, Lake Havasu City, Arizona, Bradford, Pennsylvania, Coliforms, State parks, Water wells, Beavers, Septic tanks.

Deficiencies in water treatment practices and plant operation were the causes of three outbreaks of waterborne disease during 1979. Beavers infected with giardiasis were the source of an epidemic of diarrheal illness affecting at least 2900 people in Bradford, Pennsylvania. Antiquated, inadequate chlorination equipment allowed nonchlorinated water to be delivered during 15 minute cylinder changes. In addition, sampling for residual chlorine was done too near the injection point, giving misleading high readings and resulting in low doses of chlorine. In this case, all components of the multiple barrier system had failed. After many visitors to the Cattail Cove State Park at Lake Havasu City, Arizona, became ill, dye tests revealed a connection between the sewage effluent plant and the potable water system. Since the same type and color of pipe was used for the effluent irrigation system as for the potable water supply and 4 owners modified the system during 6 years, conditions were optimum for contamination. This case points out the fact that regulatory agencies frequently neglect non-community systems, which often need the most attention. The Wilds, a church camp in Brevard, North Carolina, closed after widespread gastrointestinal illness occurred. Although dye tests showed no connection of broken septic tanks and other possible sources of sewage contamination to the water supply, it was believed that channels in the limestone had become clogged, preventing the dye from entering during the test. This was an example of difficulty encountered in using untreated water. Waterborne disease outbreaks totaled 45 in 1979. Average outbreaks per year in the past were 36 during 1976-1979, 24 during 1971-1975, and 10 during 1951-1955. (Cassar-FRC)

EUTROPHICATION IN EMILIA-ROMAGNA COASTAL WATERS (NORTH ADRIATIC SEA, ITALY): A CASE HISTORY,
Instituto di Ricerca Sulle Acque, Brugherio (Italy).
G. Chiaudani, R. Marchetti, and M. Vighi.
Progress in Water Technology, Vol 12, No 1, p 185-192, 1980. 7 Fig, 3 Tab.

Descriptors: *Sea water, *Eutrophication, *Benthic fauna, *Phosphorus, *Water pollution effects, Nitrogen, Coasts, Rivers, Water quality, Fertilizers, Farm wastes, Europe, Italy, Mediterranean.

Eutrophication phenomena in the Emilia-Romagna coastal area of the Mediterranean were found to be caused by phosphorus pollution. The distribution of nutrients in area waters was determined. The

area receives a total of 19,000 metric tons of phosphorus and 152,000 metric tons of nitrogen from various sources. The distribution of these nutrients matched the distribution of algal biomass. Diatoms developed in the northern areas near the mouth of the Po River. Dinoflagellates bloomed in strictly coastal waters. A strategy to prevent eutrophication is presented. Total phosphorus could be reduced to 5% of its present level if 95% of urban, zootechnical, and industrial wastes were removed and if fertilizers were used more sparingly. The study took place in 1976-78. (Small-FRC)

MICROCOSM SYSTEM STUDY OF ALGAL BLOOM FORMATION,
National Inst. for Environmental Studies, Yatabe (Japan). Lab. of Freshwater Environment.
M. Okada, and R. Sudo.
Journal of the Water Pollution Control Federation, Vol 52, No 5, p 1029-1034, May, 1980. 8 Fig, 12 Ref.

Descriptors: *Cyanophyta, *Eutrophication, *Microcosm studies, *Algae, Laboratory studies, Biomass, Diurnal, Microcystis aeruginosa, Microcystis flos-aquae.

To overcome the complicating factors of field studies and the oversimplification of laboratory studies, a microcosm system, intermediate between the two, was devised to study algal blooms. The system consists of Microcosm A, 2 tanks, and Microcosm B, 5 tanks, with associated tanks, pipelines, control systems, sterilizing equipment, computer, etc. Microcosm A is used for studying the photic zone and B for the aphotic zone. It is possible to alter growing conditions to simulate thermoclines, Langmuir circulation, air-water gas exchange, and diurnal variations. Growth curves for Microcystis aeruginosa were obtained at different depths (0.3 meters to 3.0 meters) without thermal stratification. On the 20 to 27th days, a bloom was present on the surface, followed by a sudden collapse. Similar studies on Microcystis flos-aquae with thermal stratification showed an algal biomass 10 times greater in the upper layers compared with the deeper layer. Rates of population growth were significantly less than in flask culture. Although little diurnal variation of dissolved oxygen was observed, a large vertical change was seen, and the concentration at a depth of 2 meters was 2 mg per liter. (Cassar-FRC)

THE LOADING CONCEPT AS BASIS FOR CONTROLLING EUTROPHICATION: PHILOSOPHY AND PRELIMINARY RESULTS OF THE OECD PROGRAMME ON EUTROPHICATION,
Canada Centre for Inland Waters, Burlington (Ontario).
R. A. Vollenweider, and J. Kerekes.
Progress in Water Technology, Vol 12, No 2, p 5-38, 1980. 6 Fig, 3 Tab, 31 Ref.

Descriptors: *Eutrophication, Control, *International commissions, *Data collections, Phosphorus, Lakes, Mathematical models, North America, Europe.

A major cooperative program involving 18 countries and including more than 50 research centers was developed to provide a sufficiently large body of comparable data to permit the derivation of quantitative relationships between loading and eutrophication of lakes. The four projects which make up the program are: an alpine project, a northern project, a reservoir and shallow lake project, and a North American project. Standard parameters for measuring and monitoring eutrophication have been established. One preliminary result is a confirmation that in 70 to 80% of the cases studied so far, phosphorus was found to be the production-controlling factor. A relationship is being studied between lake phosphorus levels and loading estimates, and Dillon's and Vollenweider's models are presented. (Small-FRC)

MARINE STUDIES ON A COASTLINE WITH SEWAGE OUTFALLS,
Techniche Eliminazione Inquinamenti, Milan (Italy).
P. G. Vigliani, B. Sclavi, A. Visconti, and G. F. Tartaglia.
Progress in Water Technology, Vol 12, No 1, p 145-162, 1980. 11 Fig, 5 Tab.

Descriptors: *Water pollution effects, *Outfall sewers, *Sewage, *Sea water, *Water properties, Water quality, Phytoplankton, Benthic fauna, Coliforms, Biochemical oxygen demand, Chemical oxygen demand, Turbidity, *Italy, Mediterranean.

A 90 km long section of the Italian coast with five existing sewage outfalls was investigated to determine the short and long term effects of discharges on the environment. Sea water and sewage/water mixtures were tested for current velocity and direction, depth, temperature, turbidity, dissolved oxygen, silicates, chlorides, salinity, pH, suspended solids, BOD5, COD, nitrogen, phosphates, oils and greases, coliforms, benthos, and phytoplankton. Measurements were made during periods of normal and maximum pollution load. Minimum initial dilutions measured at the plumes were 1:19 for the outfall Anzio Capoluogo, 1:25 for Torvaianica, 1:43 for Nettuno, and 1:65 for Anzio Bottaccio. The concentration of dissolved oxygen around the plume was also close to or greater than saturation, and entrapments of the discharge almost never occurred. Bacteria die-off rates in the sewage/sea water mixture averaged T90 of 1.65 hr and a minimum of approximately 1 hr. The minimum time of return-to-shore varied from 0.7 hr to 3.1 hr. Benthic and phytoplankton studies indicated that the pollution had a slight effect on the ecosystem of the area. (Small-FRC)

EFFECT OF CONSTRUCTION AND USE OF A HARBOR-INDUSTRIAL COMPLEX ON THE DISTRIBUTION AND EVOLUTION OF THE BENTHIC POPULATION OF A MEDITERRANEAN GULF (GULF OF FOS). (INFLUENCE DE LA CONSTRUCTION ET L'EXPLOITATION D'UN COMPLEXE PORTUAIRE ET INDUSTRIEL SUR LA DISTRIBUTION ET L'EVOLUTION DES PEUPLEMENTS BENTHIQUES LITTORAUZ D'UN GOLFE MEDITERRANEEN (GOLFE DE FOS)),
Centre d'Oceanographie, Marseille (France). Station Marine d'Endoume.
G. Stora, and J. C. Romano.
Progress in Water Technology, Vol 12, No 1, p 137-144, 1980. 3 Fig, 8 Ref.

Descriptors: Sedimentology, *Benthic fauna, Sewage, *Excavation, *Construction, Effects, *Industrial wastes, Bioindicators, *Harbors, Water pollution sources, Gulf of Fos, *Mediterranean.

The effects of the construction and operation of a harbor and industrial complex on the benthic fauna of the Gulf of Fos were studied from 1964 through 1978. Construction (1964-1972), which included digging of the harbor, caused sedimentary instability, and only a few benthic species were found. In 1975, three years after the last construction work, species adapted to silting bottoms had replaced benthic fauna originally found in the area. There was an increase in pollution indicator species, indicating that the expected degradation of the environment had occurred. The sewage from the harbor and industrial complex are added to the sewage already in the Gulf, resulting in more Gulf pollution. (Small-FRC)

PREDICTION OF THE CALCIUM CARBONATE SATURATION PH IN COOLING WATER,
Houston Univ., TX. Dept. of Civil Engineering.
L. M. McGaughey, and J. V. Matson.
Water Research, Vol 14, No 12, p 1729-1735, December, 1980. 5 Fig, 5 Tab, 16 Ref.

Descriptors: *Mathematical studies, *Cooling water, *Calcium carbonate, Computer models, Model studies, *Hydrogen ion concentration, Industrial wastes, Equations, Waste water, Minerals, Salinity, Sulfates, Ions.

In 1936, the Langelier pHs equation was formulated to estimate the pH at which a water would be in equilibrium with CaCO3. A mathematical study was performed to quantify the extent of ion association in waters typical of open recirculating cooling systems, to derive a theoretical term for the Langelier pHs equation to explain significant calcium complexation, and to develop a method to amend the original Langelier equation to bring it in line with current theory. A computer model was used to solve the simultaneous equations describing the industrial cooling water systems investigated. When sulfate levels were approximately 1000 ppm, the calculated pHs was considerably altered. To correct for this, a predictive technique was proposed, wherein a system would be operated at a higher pH or at the same pH with higher calcium concentrations. The first option offers economic savings by reducing acid consumption, while the second option would afford reduced waste water production by maintaining higher dissolved mineral levels. The proposed correction should offer accurate results for pH ranges of 6.5-9.7 and ionic strengths of up to 0.5 M. (Geiger-FRC)

A STEADY STATE EUTROPHICATION MODEL FOR LAKES,
Iowa Univ., Iowa City. Dept. of Civil (Environmental) Engineering.
J. L. Schnoor, and D. J. O'Connor.
Water Research, Vol 14, No 11, p 1651-1665, November, 1980. 9 Fig, 2 Tab, 28 Ref.

Descriptors: *Eutrophication, *Model studies, *Northeast U.S., *Lakes, Great Lakes Region, *Lake Ontario, Mathematical models, Hydrolysis, Sedimentation rates, Phosphorus, Nutrients, Water management, Kinetics, Mathematical studies, Phytoplankton, LBJ Lake, Texas.

An alternate approach to eutrophication modeling is presented which simplifies assumptions of the kinetic and transport equations. Both steady and non-steady state cases were studied for LBJ Lake, Texas (a short detention time reservoir) and Lake Ontario (a long detention time reservoir). Steady state solutions are also given for 81 of the phosphorus-limited lakes of the US National Eutrophication Survey. Use of the model requires the estimation of the sedimentation, hydrolysis, autocatalytic growth, and death rate constants. The sedimentation rate constant determines the amount of phosphorus lost to the deep sediment, and the total phosphorus levels of the lake. The other three constants control the partitioning of nutrients among the various organic, inorganic, and phytoplankton fractions. In the lakes sampled in the northeast and north central United States, phytoplankton accounted for 10-40% of the total phosphorus, while dissolved phosphorus was 35-75% and organic phosphorus 0-40% of the total. The steady state model was recommended for use as a management tool when detailed analyses are not practical. (Geiger-FRC)

EFFECT OF INDUSTRIAL POLLUTION ON THE KALU RIVER ECOSYSTEM,
Institute of Science, Bombay (India). Environmental Chemistry Lab.
G. N. Mhatre, S. B. Chaphekar, I. V. R. Rao, M. R. Patil, and B. C. Haldar.
Environmental Pollution, Series A: Ecological and Biological, Vol 23, No 1, p 67-78, September, 1980. 2 Fig, 4 Tab, 19 Ref.

Descriptors: *Water pollution effects, *Industrial wastes, *Aquatic life, Pollutants, Water quality, Kalu River, *India.

In an effort to understand the effects of industrial effluents on estuarine ecosystems, water samples were taken from the Kalu River. This river originates in the Western Ghats, later reaching the Bhatsai River and then the Ulhas River near Kalyan, an industrial suburb of Bombay. The combined river flows for about 45 km further, receiving effluents from more than 150 industrial units before it meets the Arabian Sea. The major differ-

ences between water quality at Ambivali and that at Titwala, 8 km upstream, were accounted for by the discharge of effluents from four industrial plants at Ambivali. Aquatic life was severely hindered at Ambivali, with the water contaminated by both inorganic and organic pollutants including metals, chlorides, dyes, organic acids and others. Toxic heavy metals were studied in detail both in the water and in the sediments along the route. Sediments contained high levels of toxic metals at both Ambivali (which was expected) and Titwala (which was unexpected). The diversity of aquatic plants in the intertidal region at Ambivali was low compared with that at Titwala. Algae were abundant at Titwala, but hardly any were found at Ambivali. (Baker-FRC)

STEADY-STATE OSCILLATION OF UPTAKE KINETICS BY MICROORGANISMS IN MESOTROPHIC AND EUTROPHIC WATERMASSES,
Tsukuba Univ., Ibaraki (Japan). Inst. of Biological Sciences.
H. Seki, T. Terada, and S. Ichimura.
Archiv fur Hydrobiologie, Vol 88, No 2, p 219-231, March, 1980. 4 Fig, 20 Tab, 12 Ref.

Descriptors: *Kinetics, *Eutrophication, *Cycling nutrients, Amino acids, Carbohydrates, *Japan, Nitrogen, Seasonal, Fluctuations, Municipal wastes, Environmental effects, Rivers, Temperature, Mesotrophy, Aquatic microorganisms, Bays.

Michaelis-Menton kinetics were used to measure the in situ amplitude of steady-state oscillations in the microorganisms of the Inohzawa River, Shimoda Bay and Kuroshio Counter Current. These three sites were affected directly or indirectly by municipal waste discharges of Shimoda City, Japan. Bioassays conducted during all four seasons showed that turnover rates of the amino acids and carbohydrates are divided without regard to seasonal changes by thresholds among a mesotrophic watermass of the Kuroshio Counter Current and a eutrophic watermass of Shimoda Bay. The kinetics of the Inohzawa River were classified as eutrophic. Turnover rates suggested that the steady-state oscillations occurred in a certain range divided by the thresholds. Evidence was also present which indicated regulation of the oscillations by inorganic nitrogen with a negative feed-back system similar to that found in vivo. Temperature had little effect on the steady-state oscillations of the area. (Geiger-FRC)

5D. Waste Treatment Processes

FEASIBILITY OF ON-SITE DENITRIFICATION OF WASTE WATER BY SEPARATION OF GREY AND BLACKWATER,
Connecticut Univ., Storrs. Inst. of Water Resources.
R. Laak.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-173916, Price codes: A02 in paper copy, A01 in microfiche. Technology Transfer Report, 1981. 6 p. OWRT-A-999-CONN(19), 14-34-0001-0107.

Descriptors: *Denitrification, *Waste water, *Nitrification, *Waste water treatment, Greywater, Blackwater, Separation techniques, Filters.

A condominium complex with eight separate systems and a private residence were used to study the feasibility of on-site denitrification of waste water by separating grey and blackwater. The condominium complex denitrification reactors and groundwater quality could not be sampled due to leakages and temporary access difficulty. However, laboratory studies and the private residence verified that greywater is a suitable and feasible organic carbon source for the denitrification step. The most difficult step was found to be the nitrification filter design. Conventional subsurface underdrain filters need to be redesigned to yield optimal nitrification of the blackwater. The passive denitrification system called the RUCK system requires no more maintenance and operation than a conventional septic tank system. The RUCK effluent far surpasses conventional septic tanks and package plan effluent quality.

COMBINED SEWER SYSTEM ANALYSIS USING STORM AND SWMM FOR THE CITY OF CORNWALL,
Gore and Storrie Ltd., Ottawa (Ontario).
J. C. Anderson.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-173858, Price codes: A11 in paper copy, A01 in microfiche. In: Proceedings, Stormwater Management Model (SWMM) Users Group Meeting, 19-20 June, 1980, Toronto, Ontario, Environmental Protection Agency Report EPA 600/9-80-064, December, 1980, p 1-22. 7 Fig, 4 Tab.

Descriptors: *Combined sewers, *Storm water, *Model studies, *Sewage disposal, Canada, Waste storage, Overflow, St. Lawrence River, Water pollution, Interceptor sewers, Treatment facilities, Hydraulics, *Cornwall(Ontario).

In the City of Cornwall, Canada, the flow from combined sewers is intercepted through regulator chambers, designed to intercept 2.5 times dry-weather flow. All flows exceeding this amount are discharged directly to the St. Lawrence River. At present, the plant is operating in an overloaded condition, and high bacteria levels have been measured at swimming beaches along the river shore. The Storage Treatment Overflow Model (STORM) was used to screen a number of control alternatives, and develop statistics with respect to system operation for various levels of both storage and treatment capacities. Subsequently, the Storm Water Management Model (SWMM) was used to assess selected control alternatives under individual event operation. After the STORM model was calibrated and modified for local conditions, a simulation of the system operation was undertaken over a period of one year, comparing both volume of overflow and number of events to those actually measured. Control alternatives considered include: various levels of treatment plant capacity expansion in-system storage, diversion of storm flows from the combined sewer system, improvements in street sweeping practices and industrial flow control or abatement. The most promising alternative is some combination of storage and treatment. SWMM was used to assess the hydraulic operation of the interceptor sewer under individual event operation with the easterly overflows closed and the entire wet weather flow intercepted. (Moore-SRC)

THE APPLICATION OF E.E.C. BATHING WATER STANDARDS TO THE DESIGN OF SEA OUTFALLS,
Dundee Univ. (Scotland). Dept. of Civil Engineering.
J. A. Charlton.
Progress in Water Technology, Vol 12, No 1, p 369-382, 1980. 6 Fig, 16 Ref, 1 Append.

Descriptors: *Waste dilution, *Dispersion, *Outfall sewers, Ocean currents, Tidal effects, Waste water treatment, Tracers, E. coli, Mediterranean, United Kingdom.

Survey and outfall design methods which have been successful in high and low tidal activity areas surrounding the United Kingdom are described. The direct discharge of macerated and screened sewage through a carefully designed outfall can meet the current E.E.C. bathing water standards. Water movement in the area of a proposed outfall must be measured using current metering or float and drogue tracking. Radioactive tracers or fluorescent dyes can be used for dispersion studies. A long term analysis of the wind climate can aid in the assessment of bacterial levels within the effluent plume. The possibility of a thermocline and the problem of low tidal energy are considered if the area under study is in the Mediterranean. The method of discharge will be influenced by these factors. For example, it may be necessary to release the sewage at a level above the thermocline so that effluent is not trapped below the surface where ultraviolet light cannot aid in reduction of bacteria (E. coli). MODELLING THE BIOCHEMICAL OXIDATION PROCESSES IN ARTIFICIAL CONDITIONS OF WASTE TREATMENT PLANTS,
Akademiya Nauk SSSR, Moscow. Inst. Vodnykh Problem.
V. A. Vavilin, V. B. Vasiliev, and S. S. Kuzmin.
Ecological Modelling, Vol 10, No 2, p 105-137, July, 1980. 7 Fig, 7 Tab, 81 Ref.

Descriptors: *Model studies, *Waste water treatment, *Oxidation, Mathematical models, Activated sludge, Monod's model, Grau's model, Ammonia, Glucose, Organic wastes.

Models for the biochemical oxidation of organic materials in waste water treatment plants are compared. Waste treatment models in activated sludge systems or biofilm reactors can be explained by either the diffusion mechanisms of oxidation of single substrates or by superimposition of the kinetics of oxidation of single substrates onto measurements of the dynamics of oxidation of a complex pollutant. In a multicomponent substrate the rate of oxidation of sewage water depends on number, type, and concentration of the single substrate; characteristics of sludge and biofilm; and hydrodynamic characteristics of liquid flow. Grau's and Monod's models are similar, with one coefficient to be determined in Grau's model and two in both Grau's refined model and Monod's model. This paper derives the conditions under which zero- and first-order models are valid for oxidation of single substrates, and gives formulas for rate constants and a formula for the half-saturation constant. Experimental data on glucose and ammonia agreed satisfactorily with data calculated from the model. (Cassar-FRC)

DETERMINATION OF HYDROLYTIC ACTIVITIES IN WASTE WATER SYSTEMS BY MICROCALORIMETRY,
Innsbruck Univ. (Austria). Hygienisches Inst.
B. Redl, and F. Tiefenbrunner.
Water Research, Vol 15, No 1, p 87-90, January, 1981. 5 Fig, 14 Ref.

Descriptors: *Biodegradation, *Anaerobic digestion, *Microcalorimetry, Kinetics, Sludge digestion, Metabolism, Carbohydrates, Proteins, Analytical techniques, Monitoring, Thermodynamic behavior, Testing procedures, Waste water treatment, Biological treatment, *Waste water facilities.

A method is described for the evaluation of hydrolytic processes in waste water systems by isothermal microcalorimetry. The adaptation of the degradation system to a particular substrate was measured in terms of net heat production. Samples examined included supernatant from the sludge drainage from a sludge densifier, a digested sludge taken from a digestion tank, a sludge taken from a digested sludge storage area, and water from the collecting basin of a garbage dump. Heat fluxes were recorded for the actions of samples on substrates of cellobiose, starch, skim milk, carboxymethylcellulose (CMC), and olive oil, and thermograms of heat effects over a 30-hour period were compared. Supernatant from sludge drainage was able to degrade all of the samples added to it within a 20 hour period. Cellobiose and starch were consumed much more slowly by the digested sludge samples from the sludge storage area, and CMC and olive oil were not hydrolyzed at all by this system within the observation period. In the basin water system, cellobiose was degraded more rapidly than CMC or starch. It was deemed possible to draw conclusions about the degree of degradation on the basis of the total amount of heat produced. The method permits direct and continuous monitoring of microbial activity and is particularly well adapted to anaerobic conditions. (Geiger-FRC)
W81-01984

VOLATILE ORGANIC ACIDS IN RAW WASTE WATER AND IN PHYSICO-CHEMICAL TREATMENT,
Technion - Israel Inst. of Tech., Haifa. Environmental and Water Resources Engineering.
N. Narkis, S. Henefeld-Fourrier, and M. Rebhun.
Water Research, Vol 14, No 9, p 1215-1223, September, 1980. 5 Fig, 7 Tab, 16 Ref.

Descriptors: *Organic acids, *Volatility, *Waste water treatment, Sewage, Sewage treatment, Chemical precipitation, Chemical analysis, Chemical degradation, Flocculation, Activated carbon.

The composition of volatile acids in raw sewage and the content of each individual acid was studied. Haifa municipal sewage and fresh residential sewage from Neveh Shaanan were sampled. The age of the municipal sewage at the point of sampling is estimated to be 6-12 hr. The age of the residential waste water at the collection point is 10-60 min. The percentage of volatile acids was much higher at the municipal treatment plant than in the residential waste water. Experimentation proved that the concentrations of acetic, propionic, butyric and isovaleric acids increase on storage at room temperature and in a refrigerator. Smaller changes were also noted in butyric and isovaleric acids, while valeric acids remained constant. Hexanoic acid was not detected. Extensive anaerobic decomposition takes place in the Haifa region sewage due to longer flowing time. (Baker-FRC)

SEPARATION OF LINDANE FROM ITS AQUEOUS SOLUTIONS BY REVERSE OSMOSIS SYSTEM,
Health and Welfare Canada, Ottawa (Ontario). Health Protection Branch.
M. Malaiyandi, P. Blais, and V. S. Sastri.
Separation Science and Technology, Vol 15, No 7, p 1483-1488, August, 1980. 2 Tab, 13 Ref.

Descriptors: *Pesticides, *Water purification, *Reverse osmosis, Waste water treatment, Membrane processes, Potable water, *Lindane, Water pollution, Osmosis, Water treatment.

Lindane at trace levels partially crossed a cellulose acetate reverse osmosis membrane. Another portion of the pesticide was adsorbed onto the membrane and slowly released into the product water. Since reverse osmosis water purifying systems are used extensively to produce high quality water for electronics and medical use, the possiblity of such water contamination should not be overlooked. After treatment, 36 and 24 + or - 1% of the initial quantities of lindane were found in recycled feed and product solutions, respectively, leaving 40% unaccounted for and presumed adsorbed on the membrane. Repeated washing of the membrane with water and ethanol removed 10% of the total. Destructive testing of the membrane indicated that a major portion of lindane was tenaciously adsorbed. (Cassar-FRC)
W81-01996

VOLATILIZATION, PLANT UPTAKE AND MINERALIZATION OF NITROGEN IN SOILS TREATED WITH SEWAGE SLUDGE,
Purdue Univ., Lafayette, IN. Water Resources Research Center.
L. E. Sommers, C. F. Parker, and G. J. Meyer.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-173940, Price codes: A05 in paper copy, A01 in microfiche. Technical Report No 133, February, 1981. 64 p, 23 Fig, 24 Tab, 74 Ref. OWRT B-084-IND(1).

Descriptors: *Sludge utilization, *Sewage sludge, *Crop response, *Sorghum, *Ammonia volatilization, Sludge disposal, Land treatment, Water pollution, Ammonia, Nitrogen, Activated sludge, Anaerobic digestion, Nitrogen mineralization, Soil treatment, Application methods, Impaired water use.

Field and laboratory experiments were conducted to quantify the amount of ammonia volatilization taking place after application of sewage sludge to the soil surface, evaluate the movement of nitrogen and plant uptake from soils treated with sewage sludge, and determine the potential N mineralization in a wide range of sewage sludges. Volatilization of NH sub 3-N was found to be dependent upon the method of sludge application, initial soil moisture content and sludge pH. Sorghum plants recovered 7 to 27% of the total sludge N while the recovery of the total N ranged from 8 to 33% considering the N in the soil to a depth of 90 cm. Significant losses of sludge inorganic N occurred within 3 days of application. The amount of mineralizable N in 24 sewage sludges was found to be proportional to the total organic N content. The results of the study demonstrated the need to use a different N mineralization percentage for the various sludge types. Recognizing the limitation of the study, the recommended N mineralization percentage to use in calculating the appropriate sludge application rate for agronomic crops is 25% for raw and primary sludges, 40% for waste activated sludges, 15% for anaerobically digested sludges and 8% for composted sludges.

SLIMES CONSOLIDATION AT THE HENDERSON MINE,
Bureau of Mines, Spokane, WA. Spokane Research Center.
R. H. Sprute, and D. J. Kelsh.
Available from Supt. of Documents, GPO, Washington, DC 20402, No. I28. 23: 8441. Bureau of Mines Report of Investigations, 8441, 1980. 20 p, 9 Fig, 3 Tab, 5 Ref.

Descriptors: *Waste treatment, *Mine wastes, *Dewatering, *Mine water, Colorado, *Slime, Settling basins, Zeta potential, Electrophoresis, Electro-Osmosis.

Underground accumulations of slimes in the Henderson molybdenum mine are routed to two large collection pits where they are dewatered and consolidated by application of direct electrical current. Densified material is then removed to ore cars by rubber-tired front-end loaders and transported out of the mine. The electrical dewatering installation is described and its efficiency of operation compared with that predicted from preliminary studies performed by the Bureau of Mines. Direct current from a 150 kilowatt rectifier (applied for 44 hours at 400 amperes and 65 to 70 volts) converted slimes containing 25.3% solids to material ranging from 44 to 65% solids. Better results can be expected if the ramp and front sections of the pits are treated separately, using higher current density. The sump design and mode of operation should be generally applicable to other underground metal mines, following preliminary laboratory tests. (Brambley-SRC)

EFFLUENT CAN BE EXPENSIVE.
Imiesa (Johannesburg), Vol 4, No 5, p 9, 57, May, 1979. 1 Fig.

Descriptors: *United Kingdom, *Water pollution, *Effluents, *Water reuse, Recycling, *Waste water treatment, Industrial wastes, Pollution abatement, Water authorities, Flocculation, Spillage, Oil wastes, Water costs.

A United Kingdom company, West Midlands Passenger Transport Executive, has installed a water recycling system to treat its effluent from the washing of engines, refuse disposal vehicles, and buses. The company was prompted to do this due to the increasing costs of effluent treatment by water authorities. The recycling system is marketed by Concept Cleaning Equipment and, since its installation, has solved the company's discharge problem and reduced the volume of clean water needed. Before entering the main recycling plant the effluent goes through a screen. Next it is treated by electrolysis to separate the solids into flocs. An upward flow of water causes most of the flocs to settle to the bottom. After skimming the water flows through nylon bags and a carbon filter. Final recycled water has a pH of 7 with suspended solids of 6.5 ppm. The system requires careful operation and maintenance to keep water quality high. (Seigler-IPA)

SOLID LIQUID SEPARATION BY FILTRATION -- A REVIEW.
The Professional Engineer (Pretoria), Vol 7, No 2, p 9-10, April, 1978. 1 Fig.

Descriptors: *Filtration, *Separation techniques, *Water purification, *Filters, Centrifugation, Water quality, Sands, Rapid gravity filters, Liquids, Suspended solids, *Water treatment, Reviews.

Filtration, the production of a clear liquid or of the particles suspended in the liquid, has many industrial process applications, however, the largest application is for water purification. Deep sand bed filtration of water has been substantially developed. More recent developments have been made with rapid gravity filters, where filter cleansing is particularly important. Although many accessories exist for rapid gravity filters, it is quite feasible to filter water effectively without them. Suspended solids clarifiers are considered an essential precursor to filtration. Clarification and rapid gravity filtration now form the basis for water purification. A wide variety of filters exist for the filtration of industrial liquids such as beverages, oils, ores, minerals, and pharmaceuticals. The plate and frame filter is generally used for beverage filtration. Vertical tank, horizontal leaf filters are also used for beverage filtration and for food polishing. Other industrial filtration methods include candle filters, vacuum filters, centrifuges, and ion exchange separation. (Seigler-IPA)

URBAN WASTE WATER POLLUTION CONTROL IN SOUTH AFRICA.
Johannesburg City Engineer's Dept. (South Africa).
E. J. Hall.
Imiesa (Johannesburg), Vol 4, No 6, p 44-45, June, 1979.

Descriptors: *South Africa, *Waste water(Pollution), *Urban hydrology, Waste water disposal, Eutrophication, Sludge treatment, Water quality standards, Water quality, *Waste water treatment, Industrial water, Urban drainage, Solid wastes, Research and development, Water Act No. 54.

A semi-arid climate with cyclic drought patterns has forced South Africa to emphasize high standards of waste water purification to safeguard river water quality. As evidence of this emphasis, Johannesburg installed its first major sewerage system in 1904, and constant improvements have been made since then. In 1956 the Water Act No. 54 was enacted and superseded all earlier legislation. It enshrined the country's water resources as a national asset to be under the control of the Department of Water Affairs. While the Act sets standards, no financial grants or subsidies are made and each local authority must bear the full costs of compliance with the Act. This policy has made industries water-conscious and has encouraged recycling. Active research at all levels is an important feature of waste water control. The South African Council for Scientific and Industrial Research and the National Institute for Water Research coordinate these activities. Current areas of concern include eutrophication, sludge treatment, and solid waste disposal. South Africa can claim that it has not been backward in progress made with its major, but limiting resource, water. (Seigler-IPA)

DESIGN OF DECHLORINATION UNITS FOR POWER PLANT COOLING STREAMS,
California Univ., Davis. Dept. of Chemical Engineering.
C. Tan, S. Whitaker, and A. Berker.
Journal of the Water Pollution Control Federation, Vol 52, No 2, p 299-309, February, 1980. 11 Fig, 11 Ref.

Descriptors: *Waste water treatment, *Electric power industry, *Cooling water, *Chlorination, Turbulent flow, Utilities, Pollutants, Chemical reactions, Chemical engineering, Water pollution control, Water treatment, Effluents, Industrial wastes, Biocides, *Dechlorination, Model studies.

A simplified model for solving the turbulent diffusion equation for multiple injection points is presented to aid in design of dechlorination units for once-through power plant cooling streams. In these systems sulfurous acid is reacted with the hypochlorous acid formed from the biocidal chlorination process to form very dilute hydrochloric and sulfuric acids, which are discharged into a nearby river. Since the available reaction time is often less than a minute, mixing and chemical reaction rates are important. Thus smaller, multiple injection points have advantages over a larger single point. This equation relates the available length of the mixing channel to the number of injection points and the dose of sulfurous acid. In most cases a calculated overdose of sulfurous acid produces the best results. (Cassar-FRC)

LEAD REMOVAL WITH ADSORBING COLLOID FLOTATION,
Vanderbilt Univ., Nashville, TN.
E. L. Thackston, D. J. Wilson, J. S. Hanson, and D. L. Miller, Jr.
Journal of the Water Pollution Control Federation, Vol 52, No 2, p 317-328, February, 1980. 3 Fig, 3 Tab, 47 Ref.

Descriptors: *Lead, *Flotation, *Froth flotation, Heavy metals, Metals, Waste treatment, *Waste water treatment, Industrial wastes, Pilot plants, Flocculation.

Lead was removed from waste water in batch and continuous-flow studies of a flotation process. Batch experiments (lead concentration 50 mg per liter) showed that the optimum pH was 6.5, and that increasing ionic strength was detrimental. Above 4,250 mg per liter sodium nitrate, the separation efficiency dropped off noticeably. Ferric hydroxide proved to be a more effective adsorbing floc than aluminum hydroxide. Sodium hydroxide was a better neutralizing agent than sodium carbonate. Pilot plant studies using a flotation column 30 cm in diameter and 244 cm long were successfully conducted with a synthetic waste water containing lead at 20 mg per liter. pH control was the most acute operating problem. A 0.25 molar sodium hydroxide solution proved to be the optimum neutralizing agent. Optimum operating parameters for the 30-cm column were as follows: pH, 6.0-7.0; ferric hydroxide concentration, 100-150; sodium lauryl sulfate detergent, 35-40 mg per liter; hydraulic loading rate, 150-180 cu meters per sq meter per day; and air flow, 24-30 cu meters per sq meter per hour. If the effluent contained a high concentration of ions, a pH lower than 6.0 was more efficient. Field testing on waste water containing zinc, copper, and a variety of other materials produced interferences from phosphates and silicates. Subsequent refinements of the process produced effluents with 0.05 mg lead per liter at costs amounting to 50% of those of the traditional lime precipitation method. (Cassar-FRC)

MINIMIZING SLUDGE HANDLING AND ENERGY REQUIREMENTS FOR ADVANCED WASTE WATER TREATMENT,
Turnipseed (G. Ben), Inc., Atlanta, GA.
G. B. Turnipseed, R. P. Rivinus, and J. Brown.
Journal of the Water Pollution Control Federation, Vol 52, No 2, p 364-371, February, 1980. 7 Fig, 4 Tab.

Descriptors: *Sludge treatment, *Sludge disposal, *Waste water treatment, *Ultimate disposal, Engineers estimates, Planning, Water pollution control, Disposal, Methane, Pilot plants, Fertilizers, Nitrification, Biological oxygen demand, Estimated costs, Energy conservation, *Cobb County(GA), Georgia.

Several alternatives for sludge treatment at the proposed Noonday Creek Water Pollution Control Plant, Cobb County, Georgia, were considered in response to increasing sewerage needs and more stringent effluent requirements. Particular attention was given to minimizing sludge handling and energy costs. The rotating bio-disk system was chosen for the wet-treatment process. The system for solids treatment and disposal included thickening, digesting, dewatering, and heat drying/pelletization with subsequent sale as a fertilizer-soil conditioner. Pilot plant studies for the proposed plant indicated final design hydraulic loading rates of 1.1 gal per day per sq foot. 70% suspended solids and 30% influent BOD will be removed by primary clarification. Aluminum sulfate was the most effective chemical precipitating agent. Chemical costs for alkalinity adjustment during nitrification were estimated at $765 per day for sodium aluminate/alum and $645 per day for alum only. Methane gas from sludge digestion will be used to supply building heat and sludge heat, producing an annual energy savings of $32,000. Total annual sludge handling costs were estimated at $120 per ton, less $27 per ton income from selling the fertilizer product. Construction costs will be about $16 million. (Cassar-FRC)

PREDICTION OF ALKALINITY CHANGES IN THE ACTIVATED SLUDGE PROCESS,
Virginia State Dept. of Health, Danville.
S. N. Scearce, R. W. Benninger, A. S. Weber, and J. H. Sherrard
Journal of the Water Pollution Control Federation, Vol 52, No 2, p 399-405, February, 1980. 5 Fig, 6 Tab, 12 Ref.

Descriptors: *Activated sludge, *Waste water treatment, *Nitrogen compounds, *Alkalinity, Nitrification, Nitrates, Ammonium compounds, Hydrogen ion concentration.

Nitrification causes a pH drop during activated sludge waste water treatment, requiring constant addition of alkalinity to maintain optimum conditions. Differences between the theoretical (7.14 mg per liter as CaCO3) and observed values of alkalinity destroyed per unit nitrate formed prevent accurate pH adjustments. Therefore, the authors propose a formula based on the theory that mineralization of organic nitrogen can impart alkalinity to waste water: Change in alkalinity = 3.57 (Change in filtrate organic nitrogen - Synthesized nitrogen) - 7.14 (Change in nitrate nitrogen). At high ratios of COD to total Kjeldahl nitrogen (TKN) the microbial biomass uses a large proportion of TKN, leaving little available for nitrification and causing little destruction of alkalinity. Conversely, low COD:TKN ratios cause a large pH drop. As the TKN:ammonium nitrogen ratio increases, greater amounts of organic nitrogen become available, and greater alkalinity reduction can take place. (Cassar-FRC)

DIGITAL ON-LINE CLOSED-LOOP CONTROL FOR WASTE WATER TREATMENT OPERATION,
Metropolitan Denver Sewage Disposal District No. 1, CO.
J. K. Nelson, and B. B. Mishra.
Journal of the Water Pollution Control Federation, Vol 52, No 2, p 406-415, February, 1980. 6 Fig.

Descriptors: *Computers, *Sewage treatment, *Digital computers, *Automatic control, *Waste water treatment, Data processing, Data storage and retrieval, Control, *Denver, Colorado, Remote control, Instrumentation, Sludge, Manpower.

Actual operating experiences using a direct digital control system at the Metropolitan Denver Sewage Disposal District No. 1 are described. A dual, redundant, computer-based data acquisition and control system with remote input/output multiplexing is used for monitoring and direct digital control. There are 160 analog inputs, 46 analog control outputs, 4 analog display outfits, 550 discrete inputs, and 35 control outputs. Since January, 1977, the system has been successful in controlling influent flow split, primary sludge pumping, secondary influent pumping, return sludge flow, waste activated sludge control, digester feeding, and process quality parameter monitoring. This facility includes a 42 mgd primary treatment process and a 72 mgd high purity oxygen activated sludge process. Although only 10 persons are needed to properly operate the equipment, they are highly trained and paid, offsetting the savings from a reduction in the manpower previously needed. However, the system demonstrates efficiency, valid data collection and reporting, true real time process control, experimentation with advanced control techniques, and centralized control. FILTERBELT PRESSING OF SLUDGE--A LABORATORY SIMULATION,
Chalmers Univ of Technology, Goeteborg (Sweden).
R. E. Halde.
Journal of the Water Pollution Control Federation, Vol 52, No 2, p 310-316, February, 1980. 9 Fig, 1 Tab, 6 Ref.

Descriptors: *Sludge treatment, *Filtration, *Waste water treatment, Dewatering, Filterbelt presses, Model studies, Laboratory equipment, Testing, Separation techniques.

A flexible laboratory piston press detected small differences in sludge dewaterability. Many variations of filterbelt pressings may be simulated by subjecting the sludge to repeated pressings at varied time and pressures according to the process being studied. In this experiment only double nips were investigated (25 sec, 65 sec; 45 sec each; and 65 sec, 25 sec) at combinations of pressures from 50 to 500 kPa. Best dewatering was obtained when the second nip was at least as long as the first. This press was also used to determine the effects of various conditioning operations on sludge dewaterability. Aluminum sulfate-treated sludge produced a cake containing 8% dry solids; ferric chloride, 8.5%; polelectrolyte, 11%; and lime, 23%. Conditions used were a sludge load of 1.3 kg dry solids per sq meter; pressure 100 kPa; time, 85 sec; and specific time of pressure increase, 0.15 sec per kPa. No shear was applied. (Cassar-FRC)

TRACE METALS AND ANAEROBIC DIGESTION OF LEACHATE,
British Columbia Univ., Vancouver.
R. D. Cameron, and F. A. Koch.
Journal of the Water Pollution Control Federation, Vol 52, No 2, p 282-292, February, 1980. 4 Fig, 10 Tab, 13 Ref.

Descriptors: *Metals, *Leachate, *Anaerobic digestion, Trace elements, *Landfills, Waste treatment, Biological treatment, Waste disposal, Biodegradation, Digestion, Aluminum, Barium, Cadmium, Mercury, Nickel, Zinc, Iron, Chromium, Copper, Lead, Manganese, Calcium, Magnesium, Potassium, Sodium, Heavy metals removal

Leachate from landfills was anaerobically digested at 29 to 38C to determine the effect of trace heavy metals on the process and to assess heavy metal removal. In a medium-strength leachate 81 to 96% of BOD was removed. Settled effluent BOD removal was 83, 91, and 97% for solids detention times of 5, 10, and 20 days, respectively. COD removal varied from 65 to 80%. Heavy metals did not affect the digestion process, even over a long term operation with high loading and short retention times. Metal removal efficiencies were greater than 85% for Al, Ba, Cd, Hg, Ni, and Zn; 80% for iron; 40-70% for Cr, Cu, Pb, and Mn; 30% for Ca; and less than 10% for Mg, K, and Na. Most of the metals were associated with the sludge solids, most likely as insoluble precipitates or organically-bound complexes. There are several advantages to using this process to biostabilize landfill leachates--low heat requirements, successful performance, and ability to handle high-strength leachates. Before returning the sludge to a landfill, it is important to determine the exact form of the metal

contaminants so they will not be rapidly released upon acidification. (Cassar-FRC)

WATER QUALITY CONVERSION MATRIX OF AEROBIC BIOLOGICAL PROCESSES,
Hokkaido Univ., Sapporo (Japan).
N. Tambo, and T. Kamei.
Journal of the Water Pollution Control Federation, Vol 52, No 5, p 1019-1028, May, 1980. 8 Fig, 6 Tab, 6 Ref.

Descriptors: Water quality, *Aerobic treatment, *Organic compounds, *Biological treatment, Activated sludge, *Waste water treatment, Water treatment, Water purification, Trickling filters, Industrial wastes, Chromatography, Sewage treatment, Biological oxygen demand, Chemical oxygen demand, Efficiencies.

A conversion matrix was designed to determine water quality in evaluation of aerobic biological water and waste water treatment processes such as the activated sludge process, self-purification of natural water, and biological slow sand filtration. Organic compounds under consideration were divided into 6 groups by gel chromatography, and the dissolved organic carbon was measured at 260 nm. The derived removal efficiencies were arranged in a 2 dimensional matrix with respect to group number, and the extent of removal from various samples was estimated. Fairly good agreement between predicted and observed values was obtained for a variety of waste waters and for acetic acid solution. Slow sand filtration of diluted raw waste water and secondary effluent had higher experimental values than predicted because of interaction with ammonia and organics in the filter. (Cassar-FRC)

OXYGEN UPTAKE AS A CONTROL PARAMETER,
Memphis State Univ., TN. Dept. of Civil Engineering.
H. A. Kharajian.
Journal of the Water Pollution Control Federation, Vol 52, No 4, p 823-824, April, 1980. 1 Fig, 1 Tab, 6 Ref.

Descriptors: *Oxygen requirements, *Activated sludge, *Control, Microorganisms, Nutrients, Equations, Design, *Sanitary engineering.

The use of oxygen uptake rates to control the activated sludge process is discussed. Energy and endogenous oxygen uptake was determined from batch experimental data, and as loading increased, endogenous oxygen demand increased and energy oxygen demand decreased. These trends can be attributed to the ability of the microorganisms to store food and utilize it whenever the exogenous source of food is depleted. The variation in oxygen uptake is a function of the utilization rate or food to microorganism ratio, which is controlled by the influent organic content and the mixed liquor suspended solids in the aeration basin. The Eckenfelder equation can be used to plot oxygen uptake. The use of this equation, the coefficients of which are not constants, in the control of activated sludge may not be warranted when the influent is variable and heterogeneous. It may cause further complication of control strategies. It may, however, be useful in the design stages. (Small-FRC)

DESIGN AND PERFORMANCE OF NIGHT SOIL TREATMENT PLANTS,
Institute of Public Health, Tokyo (Japan).
Y. Magara, D. Sugito, and K. Yagome.
Journal of the Water Pollution Control Federation, Vol 52, No 5, p 914-922, May, 1980. 4 Fig, 5 Tab.

Descriptors: *Sewage treatment, *Standards, Tertiary treatment, Anaerobic digestion, *Treatment facilities, Design, Domestic wastes, *Japan, Night soil.

In Japan, 89,959 kl/day of night soil is collected by vacuum trucks from offices and homes and treated at 1186 night soil treatment plants. Septic tanks are unusual in Japan, and public sewerage does not yet reach all of the population. Before a night soil treatment plant is built, the local government is required to prepare a basic plant construction program based on a per capita excretion of 1.4 liters of human waste per day. The monthly average BOD of the effluent must be lower than 30 mg/liter, suspended solids must be less than 70 mg/liter, and the coliform bacilli count must be lower than 3000/ml. The central government specifies design criteria for treatment processes capable of meeting these standards. Most existing plants use anaerobic and aerobic digestion activated sludge processes. Advanced treatment processes are often necessary to meet present standards. These include direct incineration, high organic loading activated sludge, biological denitrification, and an exclusive treatment process for collected sludge from night soil purification tanks. Good night soil treatment eliminates the use of conduits and conserves water, since flush toilets are not needed. Collected night soil treatment can add much to public health without significant costs. (Small-FRC)

ODOR CONTROL OF WASTE WATER TREATMENT PLANTS,
Japan Sewage Works Agency, Tokyo.
S. Ando.
Journal of the Water Pollution Control Federation, Vol 52, No 5, p 906-913, May, 1980. 2 Fig, 5 Tab.

Descriptors: *Odor, *Aeration, *Waste water treatment, Treatment facilities, Control, Pollution abatement, Japan.

Odor in Japan is regulated by the Offensive Odor Control Law, which provides for municipal ordinances against odor discharge. Out of 288 municipalities that have waste water treatment plants, 161 (71%) are regulated. Most waste water plants are covered completely or partially with a roof, which helps control odors. There are 129 deodorizing facilities which employ water scrubbing, activated carbon adsorption, ozonation, or acid scrubbing. Several examples are given of deodorizing facilities. At the Toyohiragawa plant in Sapporo City part of the odorous material is incinerated at high temperatures, and another portion is used as air in an aeration tank. At the Fukashiba plant odor from the grit chamber and pumping room is treated by activated carbon adsorption. Research is being conducted on methods of odor control, and new treatment methods are being investigated to control odor production. More than half of the complaints about plant odors are caused by aeration tanks of the diffuser type. Mechanical aeration or a pure oxygen process are possible alternatives. (Small-FRC)

WASTE WATER TREATMENT PLANTS AND POLICIES OF KYOTO,
Japan Sewerage Bureau, Kyoto.
T. Yoneda.
Journal of the Water Pollution Control Federation, Vol 52, No 5, p 978-984, May, 1980. 4 Fig, 4 Tab.

Descriptors: *Kyoto(Japan), *Sewerage, *Waste water treatment, Municipal wastes, Oxygenation, Activated sludge, Sludge disposal, Effluents, Water pollution, Japan.

The city of Kyoto, Japan, population 1.5 million, began construction of sewer facilities in 1930, suspended building during and after World War II, and by 1978 served 52% of its residents. Presently 3 treatment plants operate, discharging effluents into the Yodo River, which is a drinking water source for Osaka and Kobe. The Kisshoin plant started using a 20,000 cu meter per day oxygen system in September, 1977. This system is still undergoing evaluation and optimization. Sludge disposal is a problem for all the city's plants. Since 1973 sludge has been incinerated. Effluent quality is regulated by city ordinance, which is more stringent than national standards and requires pretreatment of discharges containing toxic metals. Progressive surcharges are imposed for waste water with BOD over 200 mg per liter. Present priorities include extension of the sewer system to a goal of 100% coverage. (Cassar-FRC)

DEVELOPMENT OF SEWER SYSTEMS AND TREATMENT PLANTS IN TOKYO,
Tokyo Metropolitan Government (Japan).
K. Terada.
Journal of the Water Pollution Control Federation, Vol 52, No 5, p 961-968, May, 1980. 2 Fig, 4 Tab.

Descriptors: *Tokyo, Japan, *Sewerage, *Waste water treatment, Aeration, Activated sludge, Sludge disposal, Water reuse, Tertiary treatment, Municipal wastes.

The history, status, and present problems of Tokyo's sewer system are described. The system, started in 1883, serves 70% of the 8.5 million population and a large industrial complex. The inner city is served by 8 waste water treatment plants, using the activated sludge treatment process, with a total capacity of 5,453,000 cu meters daily. Sludge, presently produced at the rate of 3,400 metric tons per year, was formerly dumped into Tokyo Bay and is now incinerated or used for land reclamation with and without mixing with cement. Present and future concerns are sludge disposal, public relations, reuse of effluent by industry and for cleaning, overload of the combined system during periods of high rainfall, implementation of deep aeration tanks, and tertiary treatment. (Cassar-FRC)

NAGOYA SEWERAGE PLAN,
Nagoya Municipal Government Dept. of Sewage Works (Japan).
M. Ozeki.
Journal of the Water Pollution Control Federation, Vol 52, No 5, p 969-977, May, 1980. 6 Fig, 3 Tab.

Descriptors: *Sewerage, *Nagoya(Japan), *Waste water treatment, *Municipal wastes, Activated sludge, Sludge disposal, Aeration, Japan.

The City of Nagoya, Japan, population 2.08 million, began sewerage planning in 1893. The old city area was equipped with pipes by 1923. Between 1930 and 1934 treatment plants were put into operation using activated sludge with diffused aeration. World War II destroyed much of the existing facilities, and recovery was not complete until 1953. Since this time, existing plants were improved and expanded, and additional ones were built. A new method of thickening, dewatering, and incinerating raw sludge was implemented, replacing the sandbed disposal method. Future plans include centralized sludge treatment and improvement of the quality of recycled wastes from sludge handling. Ocean dumping of sludge will increase as the quantity increases. Pollution and sewer overflow occurring during heavy rainfall will be remedied. (Cassar-FRC)

CONTROL OF INDUSTRIAL WASTE WATER IN OSAKA,
Japan Sewage Works Bureau, Osaka.
K. Nanbo.
Journal of the Water Pollution Control Federation, Vol 52, No 5, p 992-998, May, 1980. 2 Fig, 5 Tab.

Descriptors: *Industrial wastes, *Water pollution control, *Waste water treatment, Osaka, *Japan, Water quality control, Control, Regulation, Discharge(Water), Legal aspects.

This paper describes the industrial waste water situation in Osaka, Japan. Of the city's 33,839 factories, 94.5% have less than 30 employees. The total industrial waste water sewer input for 1978

was 339,801 cu meters per day. Regulations dictate that all waste water in a sewered area must be taken into the system unless otherwise designated. Certain specified factories may not discharge waste water into the sewer system unless it conforms with specified requirements. Some industries may be obliged to construct their own treatment facilities. Spot inspections by patrol groups are made at the rate of 2.1 inspections per year for each factory using pretreatment. The violation rate was 24.2%. The police also investigate compliance, and violators are regularly prosecuted. Future concerns are a study of colored waste waters, limiting COD to a reasonable level, a study of recycling and reuse technology, establishment of guidelines for safe sludge disposal, and continuous, automatic water analysis. TANNERY WASTE WATER TREATMENT BY THE OXYGEN ACTIVATED SLUDGE PROCESS,
Japan Sewage Works Agency, Tokyo.
M. Kashiwaya, and K. Yoshimoto.
Journal of the Water Pollution Control Federation, Vol 52, No 5, p 999-1007, May, 1980. 1 Fig, 7 Tab.

Descriptors: *Design criteria, *Industrial wastes, Activated sludge, Oxygenation, *Tannery wastes, Pilot plants, Himeji, *Japan, Municipal wastes, *Waste water treatment.

Pilot plant studies testing the oxygen activated sludge process to treat tannery waste water defined the design criteria and operation conditions to reduce BOD5 to 20 mg per liter or less. Detention time at temperatures below 10C was reduced from 25 hours to 12 hours by combining the tannery waste water with municipal waste water. Two pretreatment plants have been built, in Himeji, Japan, one for 234 tanneries in the Takagi District and one for 99 in Shigo. All treated effluent will be further treated at the Tobu Waste Water Treatment Plant. Since tanneries are closed for holidays during several 10-day periods each year, a flow equalizer basin will be installed in the treatment plants. (Cassar-FRC)

CURRENT RESEARCH ON ADVANCED WASTE WATER TREATMENT IN JAPAN,
Japan Sewage Works Agency, Tokyo.
M. Kashiwaya, and T. Annaka.
Journal of the Water Pollution Control Federation, Vol 52, No 5, p 1008-1012, May, 1980.

Descriptors: *Waste water treatment, *Japan, *Research and development, *Pilot plants, Technology, Activated sludge, Eutrophication, Phosphorus compounds, Nitrogen compounds, Filtration, Organic matter, Nitrification, Conservation.

In Japan, 84 educational and research institutions were involved in sanitary engineering research as of 1978. Of the 576 projects performed, 254 concerned waste water treatment. Private industry also contributed many technical papers on waste water treatment. Some subjects under consideration are removal of organic matter in secondary effluents, removal and control of phosphorus and nitrogen, waste water reuse, sludge disposal with recovery of Al and P, improvement of biological processes and minimum use of chemicals, ultimate sludge disposal, combined sewer overflow control, watershed management, and trace toxicant control. Currently, the Public Works Research Institute of the Ministry of Construction is operating 3 pilot plants to study a variety of waste water treatment developments: phosphorus removal by chemical precipitation, ammonia removal by air stripping, on-site monitoring, and direct filtration of secondary effluent with inert dual media filters. The Japan Sewage Works Agency operates laboratory and pilot studies concerning oxygen activated sludge, rotating biological contactors, ultra-high rate chemical coagulation, and improvement of eutrophic Lake Biwa. Future research should be directed toward conservation of energy, resources, and land use. (Cassar-FRC)

DISINFECTION OF SECONDARY TREATED EFFLUENT WITH OZONE. (DISINFECTION DES EAUX RESIDUAIRES URBAINES PAR L'OZONE.),
SETUDE, Paris (France).
C. Gomella.
Progress in Water Technology, Vol 12, No 1, p 383-391, 1980. 1 Fig.

Descriptors: *Chlorination, *Ozonation, *Sewage treatment, Methodology, Coliforms, Disinfection, *France.

The disinfection of secondary treated effluent by chlorination and ozonation were compared. Filtered and unfiltered secondary effluent was disinfected by an economical method of ozonation. In the first stage of ozonation, a predetermined residual of ozone is obtained. In the second state, the required ozone residual is maintained for a required contact time. A four-fold reduction in total coliforms was obtained for non-filtered effluent by treatment with 8 g of ozone per cubic meter for a contact time of 9 minutes. For filtered effluent, the required dosage was 5 g of ozone per cubic meter for the same contact time. The same reduction in coliforms was obtained after chlorination of non-filtered effluent with 14 g/cu m for 13 minutes and filtered effluent with 10 g/cu m for 13 minutes. Ozonation improved the appearance, color, BOD, and COD, and had a slightly greater sterilizing effect on E. coli, fecal coliforms, streptococci, and salmonella than did chlorination. (Small-FRC)

ADVANCED WASTE WATER TREATMENT REMOVES NUTRIENTS WITHOUT CHEMICALS,
P. J. Leslie.
Water and Pollution Control, Vol 118, No 10, p 12-13, 27, 30, October, 1980.

Descriptors: *Nutrient removal, *Tertiary treatment, *Waste water treatment, Biological treatment, Phosphorus, Nitrogen, Sludge, Water quality, Water reuse, Nitrification, Denitrification, South Africa, Pilot plants, Temperature, Economics, Bardenpho process, Canada.

Work performed on biological nitrification/denitrification systems at waste water pilot treatment plants in South Africa has resulted in the development of a process (the Bardenpho process) for combined phosphorus and nitrogen removal without the use of chemical additions. The Bardenpho process has been adopted by many waste water treatment plants in Africa, South America and the United States. The method is economically advantageous over techniques requiring chemicals, while providing more than 90% removal of nitrogen and phosphorus under anoxic conditions. In the Bardenpho process the waste water passes through a primary and a secondary anoxic zone before undergoing reaeration and forced anaerobic fermentation. Sludges contain no added metal salts and may be applied to land as fertilizers. The effects of low temperatures on the Bardenpho process were examined in Canadian pilot plant studies, with results which indicated that this biological treatment could survive the cold Canadian winters. The adaptations of the process to water reuse programs are also considered. (Geiger-FRC)

MODELING AND PREDICTION OF SPECIFIC COMPOUND ADSORPTION BY ACTIVATED CARBON AND SYNTHETIC ADSORBENTS,
National Inst. for Water Research, Pretoria (South Africa).
B. M. van Vliet, W. J. Weber, Jr., and H. Hozumi.
Water Research, Vol 14, No 12, p 1719-1728, December, 1980. 6 Fig, 4 Tab, 19 Ref.

Descriptors: *Adsorption, *Activated carbon, *Mathematical models, Kinetics, Waste water treatment, Phenols, Organic wastes, Tertiary treatment, Water purification, Water treatment, Separation techniques, *Synthetic adsorbents.

Eight synthetic adsorbents and two commercially available activated carbons were examined for their ability to adsorb phenol as a model for removal of specific organics from waste water. Both the adsorption equilibrium or capacity and the mass transport kinetics of the organic in each adsorbent were considered. Data derived from finite-batch, batch-reactor equilibrium and kinetic studies was incorporated into the numeric-based predictive model for fixed-bed adsorber design. Independent experimental parameters obtained from fixed-bed adsorber runs were used to test the validity of model results. All of the isotherm data generated was mathematically described by a new empirical isotherm equation. Good agreement was achieved between the predicted and experimental breakthrough curves for the synthetic adsorbents, but for the two activated carbons, the two values agreed only about halfway through the curves, followed by a slower approach to equilibrium. Possible reasons for this latter effect, which was not explained by the present model, are discussed. The model is considered satisfactory for application to water and waste water treatment systems. (Geiger-FRC)

INACTIVATION OF F2 VIRUS WITH FERRATE (VI),
Miami Univ., Coral Gables, FL. Dept. of Civil Engineering
T. Schink, and T. D. Waite.
Water Research, Vol 14, No 12, p 1705-1717, December, 1980. 13 Fig, 3 Tab, 61 Ref.

Descriptors: *Disinfection, *Iron compounds, *Viruses, Chlorine, Viricides, E. coli, Resistance, *Waste water treatment, Water treatment, Organic compounds, Aquatic life, Environmental effects, Hydrogen ion concentration, Chlorination.

Potassium ferrate has been considered as a substitute for chlorine for the disinfection of water and waste waters. The effectiveness of ferrate (VI) as a viricidal agent against f2 virus has been tested in buffered, distilled water and secondary treated sewage effluent. The resistance of f2 virus and Escherichia coli to iron (VI) ferrate in buffered, distilled water was also studied. The inactivation of f2 virus was enhanced as pH decreased. In both pure and secondary effluent systems at concentrations of 1 ppm, potassium ferrate inactivated 99% of f2 virus in 22 minutes at pH 7.8, 5.7 minutes at pH 6.9, and only 0.77 minutes at pH 5.9. At pH 7.8, concentration of the disinfectant and time had equal effects. The resistance of f2 virus to potassium ferrate was the same as, or less than, that of E. coli inbuffered, distilled water at the pH levels tested. The disinfection reactions did not follow first order kinetics. The ferrate compounds were less affected than chlorine by changes in organic content, pH and temperature, while leaving no residual (as do halogenated disinfectants) to harm aquatic life. It was concluded that ferrate compounds would be good viricidal agents in raw and waste waters. (Geiger-FRC)

PHENOL AND FREE AMMONIA INHIBITION TO NITROSOMONAS ACTIVITY,
Pittsburgh Univ., PA. Environmental Engineering Program.

R. D. Neufeld, A. J. Hill, and D. O. Adekoya.
Water Research, Vol 14, No 12, p 1695-1703, December, 1980. 8 Fig, 2 Tab, 11 Ref.

Descriptors: *Nitrification, *Biological treatment, *Phenols, Model studies, Ammonia, Biodegradation, Microbial degradation, *Waste water treatment, Hydrogen ion concentration, Kinetics, Oxidation, Industrial wastes, Nitrite, Sewage bacteria, Respiration.

In a study designed to elucidate the possible causes of the biological nitrification process instability found in many industrial waste water operations, the rate of ammonia bio-oxidation to nitrite by an autotrophic culture of strict nitrifiers was examined. Laboratory tests were conducted using batch respirometric evaluations of Nitrosomonas cultures to quantify the effects of phenol and non-ionized (free) ammonia on biokinetic parameters. The nitrifying organisms used had been adapted to a synthetic ammonia waste, and received only inorganic carbon during the course of the experiments. Ammonia oxidation biokinetics followed Michaelis-Menten type relationships, while the influence of non-ionized ammonia on ammonia oxidation was best described by a 'substrate-inhibition' Monod kinetics model. This model accounted for observed differences in ammonia bio-oxidation as a function of pH. The Michaelis-Menten constant varied with the square root of the ambient phenol concentration. Engineering design and operational considerations for the biological removal of ammonia in waste water are also examined. (Geiger-FRC)

5E. Ultimate Disposal Of Wastes

MILL'S CONVERSION OF SOLID WASTE INTO FUEL YIELDS ENERGY SAVINGS.
Pulp and Paper, Vol 54, No 11, p 105-106, November, 1980. 1 Fig.

Descriptors: *Wood wastes, *Sludge disposal, *Incineration, Solid wastes, *Energy sources, *Fuel, Waste water treatment, Ultimate disposal, Pulp and paper industry, Industrial wastes, Abitibi-Price Co., Disposal, Waste disposal, Flotation, Water pollution treatment, Sewage lagoons, Lagoons, Settling basins, Sewage treatment, Bacteria.

Sludge from the Abitibi-Price Alpena, Michigan, hardboard mill is collected by dissolved air flotation, dewatered to a 15-25% solids content, dried to a 7-8% moisture content, and pelletized (average 1/8 inch diameter). These pellets are burned in combination with coal, saving 15% of the coal. The sludge is composed of dead bacteria which have digested the dissolved solids (essentially wood sugars) in the secondary treatment ponds. Although this procedure is a break-even proposition financially, elimination of the sludge disposal problem and improvement of environmental conditions are valuable benefits. (Cassar-FRC)

A GUIDE TO REGULATIONS AND GUIDANCE FOR THE UTILIZATION AND DISPOSAL OF MUNICIPAL SEWAGE SLUDGE.
Environmental Protection Agency, Washington, DC. Office of Water and Waste Management.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-108508, Price codes: A04 in paper copy, A01 in microfiche. Report EPA 430/9-80-015, September, 1980. 53 p, 1 Tab, 68 Ref. Pub. MCD-72 available from General Services Administration, Denver Federal Center, Denver, Colorado 80225.

Descriptors: *Municipal wastes, *Sludge disposal, *Legislation, *Waste treatment, *Ultimate disposal, Incineration, Impoundments, Landfills, Sludge treatment, Waste disposal, Treatment facilities.

This document is a supplement to the current EPA regulations and guidelines that need to be addressed, and the problems frequently encountered, when planning and operating a sewage sludge disposition (utilization and/or disposal) facility, and should aid in the selection and implementation of an appropriate disposition technique. Incineration, composting and surface impoundments are considered treatment and volume reduction methods, and landfilling, ocean disposal, land spreading, and distribution and marketing are considered ultimate utilization and disposal methods. Background information, applicable laws, regulations and guidelines, procedure needed for implementing the disposition method, problems frequently associated with the disposition method that are not covered by regulations and solutions to these problems, and references are provided for each disposition method. CONTROL OF MERCURY POLLUTION IN JAPAN AND THE MINAMATA BAY CLEANUP,
T. Ishikawa, and Y. Ikegaki.
Journal of the Water Pollution Control Federation, Vol 52, No 5, p 1013-1018, May, 1980. 1 Fig.

Descriptors: *Minamata Bay, *Japan, *Mercury, *Water pollution control, Bottom sediments, Waste disposal, Waste treatment, Disposal, Marine life, Water pollution effects, Sludge disposal, Water treatment, Ultimate disposal.

As a result of mercury poisonings in Minamata, Japan, in 1956 and 1965, strict effluent standards became mandatory in Japan. Effluents must contain no greater than detectable limits (0.0005 mg per liter) of total Hg or alkyl Hg. Industrial plants using Hg processes have largely converted to non-Hg processes. Limits for seafood were set at 0.3 mg per liter of methyl Hg and 0.4 mg per liter total Hg on a wet basis. Contaminated bottom sediments were removed in 33 of 42 specified sites by 1978. In Minamata Bay, sediment contains up to several hundred mg per liter Hg, probably as sulfides, in deposits 4 meters deep. Marine life is incurably poisoned. To avoid further water pollution by disturbing bottom sediments, plans for removal have been formulated. A temporary cofferdam will be built, into which the contaminated sediment will be pumped. Dredging will take place in this confined area. Methylation of mercury will be minimized by keeping the area flooded with sea water and protected from sunlight. Excess water will be purified before discharging. Marine life and water quality will be constantly monitored. This project, currently suspended under an injunction, is expected to take 10 years to complete. (Cassar-FRC)

5F. Water Treatment and Quality Alteration

THE CONTROL OF ANIMALS IN WATER MAINS USING PERMETHRIN, A SYNTHETIC PYRETHROID,
Essex Water Co., Maldon (England).
R. P. Mitcham, and M. W. Shelley.
Journal of the Institution of Water Engineers and Scientists, Vol 34, No 5, p 474-482, 1980. 5 Fig, 2 Tab, 7 Ref.

Descriptors: *Aquatic insects, *Pesticide toxicity, *Permethrin, Water quality, Public health, Diptera, Rainbow trout, Insecticides, Distribution systems, Population, Resistance, Laboratory tests, *Water treatment, Potable water, Gas chromatography.

When supplies of the natural pyrethrin insecticide were running low, the Langford treatment works began to test the synthetic pyrethroid insecticides, resmethrin, bioresmethrin and permethrin to control populations of chironomids in public water supplies. Permethrin toxicity to the larvae of the insect Paratanytarsus sp. and adults of Asellus aquaticus, certain domestic aquarium fish (guppies, platies, and neon tetras), and young trout (Salmo gairdneri) were examined in laboratory tests. Insects were exposed to permethrin dose levels ranging from 0.001 to 0.025 mg/liter. Aquarium fish were exposed to dechlorinated tap water containing permethrin at levels of 0.025 mg/liter. No mortality occurred in trout exposed to 0.025 mg/liter of permethrin; however, the presence of fish caused reductions in water levels of permethrin when compared to tanks containing the insecticide but no fish. This was attributed to removal of permethrin by active surfaces on the fish. No mortality was observed among the aquarium fish tested. Permethrin toxicity to the insects tested showed a dose dependent relationship, with rapid paralysis in Asellus adults and narcotic action to Paratanytarsus larvae, permitting effective flushing. Chemical analyses of permethrin levels in water were carried out by a single column gas liquid chromatographic technique, which is described. A three year monitoring program was conducted on water samples from southend water mains to assess the effectiveness of the insecticide treatment on aquatic insects. The four categories found in greatest abundance, the Paratanytarsus larvae, Cladocera, Nais and the Limnochares, were similar to those found when pyrethrin was used. Unlike pyrethrin, permethrin dosing of the water system has prevented reinfestations of the water supply even after 90 weeks. These findings show the increased effectiveness of this synthetic pyrethroid in controlling pathogenic chironomids, with no detrimental effects on fish. (Geiger-FRC)

PREVENTING HALOFORM FORMATION IN DRINKING WATER,
South Dakota School of Mines and Technology, Rapid City.
L. L. Harms, and R. W. Looyenga.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-144453, Price codes: A06 in paper copy, A01 in microfiche. Environmental Protection Agency Report EPA-600/2-80-091, August, 1980. 101 p, 18 Fig, 16 Tab, 18 Ref, 11 Append. R805149-01-0.

Descriptors: *Potable water, *Distribution systems, *Trihalomethanes, *Chlorination, South Dakota, Water purification, Disinfection, Environmental sanitation, Water pollution, Pipes, Land use, Turbidity, Water properties, Specific conductance, Chloroform, *Huron(SD).

The Huron, South Dakota, water distribution system was monitored for trihalomethanes at several locations. Deposits from within the distribution system were evaluated as potential precursor material and were found to be precursors for the haloform reaction. Field tests designed to determine the extent of trihalomethane formation that occurs as a result of the pipe deposits were inconclusive. The deposits appear to be a precursor source, but they do not substantially alter the terminal trihalomethane concentration. Ammonium sulfate was used to convert to a combined chlorine residual in the distribution system. A significant drop in trihalomethane concentrations was obtained along with maintenance of adequate disinfection. Primary disinfection was obtained by lime softening followed by a free chlorine residual. Land used upstream from the raw water intake was evaluated for potential chloroform formation. Peak concentrations occurred near marshes, where cattle watered, and where the river was stagnant. Nine raw water quality parameters were monitored and correlated with trihalomethane formation. The best correlations were obtained with specific conductance and turbidity. (Author's abstract)

CENTRAL LINCOLNSHIRE SCHEME MOVES AHEAD.

Water Services, Vol 84, No 1016, p 623-624, October, 1980. 1 Fig.

Descriptors: *Water purification, *Potable water, *Lincolnshire(UK), *Saltersford(UK), Limestones, Water sources, Groundwater, Nitrates, Surface waters, Reservoirs, Water supply, *Water treatment.

Improvement of water supplies in central Lincolnshire was commenced in 1978 by connecting reservoirs to allow transfer of water during seasons of peak demand on the Central Limestone borehole sources. By 1982 the Saltersford Treatment Works, with a maximum capacity of 25,000 cubic meters per day, will be completed. The source of water supply will be surface waters. In addition, a main connecting the treatment works with the town of Lincoln will allow the Central Limestone groundwater sources to be removed from service during periods of adverse water quality. REMOVAL OF ARSENIC FROM CONTAMINTED DRINKING WATER BY A CHITOSAN/CHITIN MIXTURE,
Saint Mary's Univ., Halifax (Nova Scotia). Dept. of Chemistry.
C. M. Elson, D. H. Davies, and E. R. Hayes.
Water Research, Vol 14, No 9, p 1307-1311, September, 1980. 1 Fig, 2 Tab, 13 Ref.

Descriptors: *Potable water, *Arsenic, *Ion exchange, *Water treatment, Chelation, Separation techniques, Chitin, Chitosan, Canada, Water wells, Copper, Sulfate.

The efficacy of a chitosan/chitin mixture in removing arsenic from natural waters was investigated. When flakes of chitosan were stirred with a water sample, the pH of the mixture increased from 6.7 to over 8 and the arsenic level in the water remained constant at 0.1 ppm. However, holding the pH of the sample to between 5.5 and 6.5 with additional acid allowed the arsenic concentration to be lowered by 80% after 150 minutes of stirring. Flakes of chitin stirred with a water sample caused the pH to be decreased by 2 units and removed 25% of the arsenic. The mixture of chitosan/chitin removed certain polyoxy-anions including arsenate from water at a neutral pH. The capacity of the mixture was about 0.1 mu mol/g, which is 10,000 times smaller than the capacity of commercial ion-exchangers. The arsenic was bound to the polymers by a combination of electrostatic, ion-exchange attraction and chelation. (Baker-FRC)

GEORGIA UNIVERSITY TEAM DEVELOPS WATER SYSTEMS GUIDE,
Georgia Inst. of Tech., Atlanta.
T. N. Debo, and H. Wanning.
Public Works, Vol 111, No 6, p 79-83, June, 1980. 6 Fig, 3 Tab, 1 Ref.

Descriptors: *Water treatment, *Potable water, *Local governments, *Publications, Georgia, Future planning, Water quality, Water resources development, Water management(Applied), Project planning, Universities, Water delivery, Costs, Water policy.

A coalition of members from Georgia's three leading universities - the Georgia Institute of Technology, the Georgia State University and the University of Georgia-was combined with a Local Government Advisory Committee to form an Inter-University Task Force (IUTF) to select and study local problems. During its first year in operation the IUTF opted to work on 'A Guide to Investments in Water Systems for Local Officials.' In 1977, revisions to the Safe Drinking Water Act of 1974 put the burden of providing safe and drinkable water supplies on the local governments. The costs for providing such potable water have increased in recent years due to inflation. The guide was designed to aid officials in analyzing future large-scale capital improvements or expansion of publically-owned water systems. The 240-page guide is composed of 13 chapters and 2 appendices. Topics include background on small water systems, treatment and distribution processes, checklists of performance criteria, planning for system improvements, rate schedules and metering policies, preventive maintenance programs, emergency procedures, recording systems, state and federal regulations, budgeting and finance, consulting services, and government aid agencies. The guide was directed to small towns with populations of 500-10,000 but may be applied to larger areas. The guide is not intended to replace the services of a civil engineer or water systems professional. (Geiger-FRC)

NEW YORK CITY'S PILOT PLANT FILTER STUDIES. PART TWO,
Metcalf and Eddy, Inc., New York.
G. P. Fulton.
Public Works, Vol 111, No 5, p 85-88, May, 1980. 6 Fig, 3 Tab, 1 Ref.

Descriptors: *Pilot plants, *Water treatment, *Filtration, Suspended solids, Turbidity, Data collections, Economics, Construction costs, Water supply, Flocculation, Settling velocity, Coagulation, Color, Water quality, Croton supply, New York City.

In part 2 of a two part report, data evaluation of information on New York's pilot plant filter studies being conducted on the Croton Supply is presented. The pilot tests proved to be well worth the investment, showing costs for a conventional plant based on the Ten-State Standards and a maximum filtration rate of 2 gpm per sq. ft. to be approximately $147 million. The costs of the pilot plant studies were nearly negligible in comparison with the potential savings of more than $14 million which represents the difference in construction costs of direct filtration and optimized conventional treatment. A unique ozone/diatomaceous earth filter process was also developed during the Croton study; this was effective in removing color and was more economical in construction costs than the granular process. The new procedure also showed economic advantages over conventional filtration during the settling step. The city of New York has decided to continue investigations into the ozone/diatomaceous earth process with larger scale facilities to refine design criteria, optimize efficiency through process and resource recovery measures, and determine adaptability to pending changes in the standards for organic constituents and disinfection. PACKAGE WATER TREATMENT PLANTS. VOLUME 2. A COST EVALUATION,
Municipal Environmental Research Lab., Cincinnati, OH. Drinking Water Research Div.
R. G. Stevie, and R. M. Clark.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-102717. Price codes: A05 in paper copy, A01 in microfiche. Environmental Protection Agency Report EPA-600/2-80-008b, July, 1980. 75 p, 25 Fig, 7 Tab, 8 Ref, 3 Append.

Descriptors: *Water treatment, *Treatment facilities, *Cost-benefit analysis, Rural areas, Potable water, Water quality, Appalachian Mountain Region, Economics, Construction costs, Municipal water, Operating costs, Capital costs, Utilities, Recreational facilities, Kentucky, Tennessee, West Virginia.

Many small and rural water treatment systems have high unit costs because of the small number of service connections and they may have trouble meeting minimal drinking water standards. An alternative to conventional water treatment plants is the package water treatment plant, which is a self-contained unit. Data were collected for water quality and costs for 36 package plants, both municipal and recreational, in Kentucky, West Virginia and Tennessee. Utility costs were separated into four components: acquisition, treatment, distribution and support services. These plants can provide water that meets the turbidity requirements of the National Interim Drinking Water Standards. Scale economies are possible in package treatment plants treating under 1 million gallons per day and they can be used in a cost effective manner in small communities. (Brambley-SRC)

URBAN WATER SUPPLY -- A STATISTICAL SURVEY,
National Building Research Inst., Pretoria (South Africa). Building Services Div.
G. J. Malan
Municipal Engineer (Johannesburg), Vol 10, No 4, p 9-11, 13-14, 16-19, July/August, 1979. 36 Tab, 3 Ref.

Descriptors: *South Africa, *Water supply, *Statistical methods, *Surveys, Questionnaires, Measurement, Statistics, Piping systems(Mechanical), Water distribution(Applied), *Rhodesia, Design criteria, Distribution systems, Utilities, Water delivery.

The results of a questionnaire on reticulation networks and water supply in buildings were statistically analyzed to provide a basis of comparison for municipalities needing to access their own standards. The questionnaires were completed by 54 local water authorities in South Africa, South-West Africa, and Rhodesia. Questionnaire items under reticulation included the following: hydraulic design criteria, pipes and jointing for mains and service connections, corrosion protection, maintenance, pressure control, and installation. Items covered under supply to buildings included the following: metering, pipe sizing, materials, location, control, and fire fighting. Tables are used to show the number of replies giving each answer for each question. Certain aspects of urban water supply showed a general consensus. Inconsistencies in design and construction standards were also evident. Recommendations on certain practices are included. (Seigler-IPA)

NOTES AND COMMENTS: THE PROBLEM WITH PERFORATED BAFFLES,
W. Goodnow
Journal of the American Water Works Association, Vol 72, No 12, p 710, December, 1980.

Descriptors: *Baffles, *Settling basins, Flow, Basins, Flocculation, *Water treatment, *Kansas City, Kansas.

In a reply to a previous paper which stated that perforated baffles improve performance in rectangular settling basins, the author describes contrary results in a similar situation at the Kansas City, Kansas, Quindaro water plant. The perforated baffles caused poor distribution of flocculated water and degradation of large floc particles passing through the baffle perforations. These baffles were replaced with 13 manually adjusted pivoting vertical baffles, and basin performance improved. (Cassar-FRC)

DESIGN OF AERATION TOWERS TO STRIP VOLATILE CONTAMINANTS FROM DRINKING WATER,
Montgomery (James M.), Inc., Washington, DC.
M. C. Kavanaugh, and R. R. Trussell
Journal of the American Water Works Association, Vol 72, No 12, p 684-692, December, 1980. 9 Fig, 6 Tab, 19 Ref.

Descriptors: *Aeration, *Organic compounds, *Water purification, Potable water, Water treatment, Trihalomethanes, Design criteria, Volatility.

Aeration using packed towers was used to remove trace organic contaminants such as trihalomethanes from drinking water. There are 4 main considerations in design of a packed tower: air-to-water ratio, superficial water velocity (and thus the column diameter), type of packing, and depth of packing. The designer must also consider the coldest air and water temperatures, physical chemistry of the contaminant, and mass transfer characteristics of the packing. The design procedure is illustrated by an example using chloroform as the contaminant. Packing material is chosen first, in many cases polypropylene or polyvinyl chloride with low packing factors, and then the number of transfer units, allowable gas flow, column diameter, height of unit, a constant (overall liquid mass transfer coefficient times interfacial area per volume of packing across which mass transfer occurs), packing height, and tower dimensions (1.5 times the calculated dimension for a safety factor) are added in. (Cassar-FRC)

RESERVOIR COATINGS CAN SUPPORT BACTERIAL GROWTH,
East Bay Municipal Utility District, Oakland, CA.
W. M. Ellgas, and R. Lee.
Journal of the American Water Works Association, Vol 72, No 12, p 693-695, December, 1980. 3 Fig, 1 Tab, 2 Ref.

Descriptors: *Protective coatings, *Storage tanks, *Bacteria, Water distribution(Applied), Coatings, Epoxy resins, Linings, Plastics, Rubber, Reservoir storage, Resins, Vinyl resins, E. coli, Water districts, East Bay Municipal Utility District, California.

An ideal potable water reservoir coating was not found in a study of 32 rubbers, vinyl resins, epoxy resins, polyurethanes, and other polymers. The most acceptable coating consisted of a 4-component vinyl resin system--primer, white undercoat, and 'final gray topcoat,' with 'gray topcoat' as the final layer. Coatings were tested for bacterial growth support on 4 species: E. coli, Enterobacter aerogenes, Klebsiella oxytoca, and Pseudomonas sp. In addition to bacterial considerations, the coating must not impart taste or odor to the water or contain excessive amounts of undesirable solvents. Problems in selecting coatings involve changes in bacterial growth potential as coatings cure and age, changes in manufacturer's formulations, and presence of toxic materials. (Cassar-FRC)

SUBMARINE TRANSMISSION LINE: LIFELINE FOR VIEQUES,
Puerto Rico Aqueduct and Sewer Authority, Hato Rey.
J. J. Mayol, and J. R. Goitia.
Journal of the American Water Works Association, Vol 72, No 12, p 678-683, December, 1980. 6 Fig.

Descriptors: *Water distribution(Applied), *Pipelines, Conduits, Water supply, Potable water, Submarine pipelines, Puerto Rico, Vieques, Conveyance structures, Closed conduits.

A submarine water transmission main from Puerto Rico to the island of Vieques, 10 miles away, insures an adequate, reliable supply of potable water for the island's 8,000 inhabitants. Inaugurated Feb. 10, 1978, this system was chosen as the most cost-effective over other alternatives--additional well-drilling, impoundment of surface runoff, and seawater desalinization. The main begins at the Puerto Rico Rio Blanco pumping station, runs 9,100 meters to a 12' diameter pipeline 3,600 meters long, and terminates at a 100,000 gal concrete tank 20 meters above sea level. The undersea section is 16' diameter lined carbon steel pipe 17,250 meters long and has a 17.2 meter difference in elevation from the Puerto Rico storage tank to the Vieques storage area, Arcadia reservoir. The pipeline does not follow a straight line under the water, because rock and coral formations interfere. Maximum depth of the pipeline is 17 meters. A 100,000 gal reservoir receives the water, which is pumped to a 250,000 gal concrete reservoir. Customers receive water by gravity through an existing pipe network. Funding, which totaled $13,901,820, was received from the Puerto Rican government, Farmer's Home Administration, and PRASA revenues. (Cassar-FRC)
W81-02073

RECENT DEVELOPMENTS IN FILTRATION SYSTEM DESIGN,
Montgomery (James M.), Inc., Pasadena, CA.
R. R. Trussell, A. R. Trusell, J. S. Lang, and C. H. Tate.
Journal of the American Water Works Association, Vol 72, No 12, p 705-710, December, 1980. 6 Fig, 8 Tab, 8 Ref.

Descriptors: *Design criteria, *Filtration, *Water treatment, Filters, Flocculation, Turbidity.

In determining water treatment plant filter efficiency, filtration rate and backwash volume can provide additional data to supplement the commonly used parameter, length of filter run. Effects of various variables on filter performance were determined in order to provide information for design considerations. Conventional filtration rates may be increased considerably without adversely affecting filter performance. On-off cycles should be limited to six per day to produce acceptable effluent. Angular filtration media perform more satisfactorily than smooth media. As the ratio of depth of the medium to diameter of the media particles increases, filter performance improves, but to a lesser extent than equations predict. Multimedia filtration produces effluent quality to that of similar dual media filtration, but requires shorter filter runs. (Cassar-FRC)

DISTRIBUTION METHODS FOR TRANSFERABLE DISCHARGE PERMITS,
Illinois Univ. at Urbana-Champaign, Dept. of Civil Engineering.
J. W. Eheart, E. F. Joeres, and M. H. David.
Water Resources Research, Vol 16, No 5, p 833-843, October, 1980. 7 Fig, 4 Tab, 5 Ref.

Descriptors: *Mathematical models, *Water permits, *Water rights, Model studies, Phosphorus, Discharge, Waste water treatment, Costs, Lake Michigan, Wisconsin, *Waste water disposal permits, *Effluent limitations, Water pollution control.

The policy of transferable discharge permits (TDP) is also known as the policy of pollution rights, marketable effluent permits and transferable residual permits. Under TDP policies, the agency charged with pollution control distributes permits allowing a certain quantity of a specified pollutant to be discharged. A mathematical model has been designed to simulate the operation of a single-price auction of TDP's. At the auction, the permits are sold by the controlling authority or are given away, free of charge, to the dischargers according to a pre-set formula. The TDP policies may be subsequently redistributed at a similar auction. A comparison of the sales method with four other free allocation schemes is presented for the hypothetical case of phosphorus discharge from point sources along the Wisconsin-Lake Michigan watershed. The first involves distribution of permits to municipal treatment plants in proportion to the average hydraulic load. The second allocates permits in proportion to the pollutant load. The third method distributes permits to waste water treatment plants in proportion to the total value of the property served by each treatment facility. The free distribution methods are more favorable for the dischargers. (Geiger-FRC)

ORGANICS; WATER QUALITY STANDARDS; CRITERIA SUMMARIES; A COMPILATION OF STATE/FEDERAL CRITERIA.
Nalesnik Associates Inc., Washington, DC.
Environmental Protection Agency, Office of Water Regulations and Standards Report, October, 1980. 29 p, 57 Ref. WA-80-A055, 68-01-6058.

Descriptors: *Water quality control, *Water quality standards, *Polychlorinated biphenyls, *Phenols, *Aromatic-compounds, Federal jurisdiction, State jurisdiction, Legislation, Water pollution sources, Effluents, Toxicity, Phthalate esters.

This digest is intended as a general information resource containing excerpts from the individual Federal-State water quality standards for three organic compounds - phenol, phthalate esters and polychlorinated biphenyls (PCB's). The sources of these chemicals in water systems are given. Because of its toxicity and possible carcinogenicity the EPA has established a zero discharge PCB federal effluent standard for new and existing production facilities. The 1976 Quality Criteria for Water established the following water quality criteria recommendations: phenol - 1 microgram per liter; phthalate esters - 3 microgram per liter; and PCB - 0.001 microgram per liter. Individual criteria are presented for the states, for the District of Columbia, and for overseas jurisdictions. (Brambley-SRC)
W81-02016

INTERMITTENT STREAMS; WATER QUALITY STANDARDS; CRITERIA SUMMARIES; A COMPILATION OF STATE/FEDERAL CRITERIA.
Nalesnik Associates Inc., Washington, DC.
Environmental Protection Agency, Office of Water Regulations and Standards Report, September, 1980. 16 p, 57 Ref. WA-80-A055, 68-01-6058.

Descriptors: *Water quality control, *Water quality standards, *Intermittent streams, *Critical flow, Aquatic life, Federal jurisdiction, State jurisdiction, Legislation, Water utilization, Channels, Pollutants, Low flow.

This digest is intended as a general information resource containing excerpts from the individual Federal-State water quality standards for intermittent streams. The EPA has recommended that water quality standards should protect specified uses of a waterway in critical low flow situations, and for intermittent streams, the Agency recommends that criteria be adopted to the extent necessary to assure that conditions in the streams or stream beds will not impair existing or designated uses in the stream or in downstream waters. The 1976 Quality Criteria for Water recommends pollutant criteria for the protection of aquatic life and other stream uses during the minimum stream flow, which in many cases is the average seven-day low flow which occurs once in ten years. Individual criteria are presented for the states, the District of Columbia, and overseas jurisdictions. (Brambley-SRC)

NITROGEN-AMMONIA/NITRATE/NITRITE; WATER QUALITY STANDARDS; CRITERIA SUMMARIES; A COMPILATION OF STATE/FEDERAL CRITERIA.
Nalesnik Associates Inc., Washington, DC.
Environmental Protection Agency, Office of Water Regulations and Standards Report, September, 1980. 18 p, 57 Ref. WA-80-A055, 68-01-6058.

Descriptors: *Water quality control, *Water quality standards, *Nitrogen compounds, *Inorganic compounds, Ammonia, Nitrates, Federal jurisdiction, State jurisdiction, Legislation, Toxicity, Water pollution sources, Nitrogen cycle, *Interstate rivers.

This digest is intended as a general information resource containing excerpts from the individual Federal-State water quality standards for ammonia, nitrate and nitrite nitrogen in interstate surface waters. The sources of each form of nitrogen in water are given. The rationale for establishing water quality criteria for these molecular forms of nitrogen are: (1) ammonia toxicity to aquatic life is well documented and its toxicity is directly dependent on the pH of the water in which it is dissolved; (2) growing plants assimilate nitrate and ammonium ions into plant proteins; and both nitrate and nitrite nitrogen are toxic to aquatic life where specific concentrations of either are reached in a waterbody. Individual criteria are presented for the states, the District of Columbia, and overseas jurisdictions. (Brambley-SRC)

PESTICIDES; WATER QUALITY STANDARDS; CRITERIA SUMMARIES; A COMPILATION OF STATE/FEDERAL CRITERIA.
Nalesnik Associates, Inc., Washington, DC.
Environmental Protection Agency, Office of Water Regulations and Standards Report, October, 1980. 46 p, 57 Ref. WA-80-A055, 68-01-6058.

Descriptors: *Water quality control, *Water quality standards, *Pesticides, Pesticide residues, *Agricultural runoff, Federal jurisdiction, State jurisdiction, Legislation, Chlorinated hydrocarbon pesticides, Effluents, Water pollution sources, Herbicides.

This digest is intended as a general information resource containing excerpts from the individual Federal-State water quality standards for fifteen pesticides. The pesticides exert detrimental effects on aquatic and animal life; some are suspected mutagens or carcinogens. The EPA recommended ambient water quality criteria are listed for aldrin/dieldrin, chlordane, chlorophenoxy herbicides, DDT, demeton, endosulfan, endrin, guthion, heptachlor, lindane, malathion, methoxychlor, mirex, parathion, and toxaphene. Their presence in water may be the result of agricultural or forestry application or production facility effluents. Individual criteria are presented for the states, the District of Columbia, and overseas jurisdictions. (Brambley-SRC)
W81-02020

TEMPERATURE; WATER QUALITY STANDARDS; CRITERIA DIGEST; A COMPILATION OF STATE/FEDERAL CRITERIA.
Environmental Protection Agency, Washington, DC. Office of Water Regulations and Standards. Report, July, 1980. 71 p, 7 Tab.

Descriptors: *Water quality control, *Water quality standards, *Thermal pollution, Aquatic life, Fish, Federal jurisdiction, State jurisdiction, Legislation, Sea water, Fresh water.

This digest is intended as a general information resource containing excerpts from the individual Federal-State water quality standards for water temperature. The standards are set to control thermal pollution caused by the discharge of heated wastes into bodies of water. The 1976 Quality Criteria for Water recommends that to protect freshwater aquatic life there is an upper limiting temperature for short-term time-dependent exposures and a limit on the weekly average temperature. To protect marine aquatic life the maximum increase in weekly average temperature due to artificial sources may not exceed 1C and the daily temperature cycle may not be altered in amplitude or frequency. Individual criteria are presented for the states, for the District of Columbia, and for overseas jurisdictions. (Brambley-SRC)
W81-02021

ANTIDEGRADATION POLICIES; WATER QUALITY STANDARDS; CRITERIA SUMMARIES; A COMPILATION OF STATE/FEDERAL CRITERIA.
Nalesnik Associates, Inc., Washington, DC
Environmental Protection Agency, Office of Water Regulations and Standards Report, October, 1980. 44 p, 57 Ref. WA-80-A055, 68-01-6058.

Descriptors: *Water quality control, *Water quality standards, *Water resources, Thermal pollution, Federal jurisdiction, State jurisdiction, Legislation, Water utilization, Water quality, Natural resources, Water properties.

This digest is intended as a general information resource containing excerpts from the individual Federal-State water quality standards for antidegradation policies. The EPA recommends that each state adopt an antidegradation policy into its water quality standards. The key concepts to be included as minimum requirements are (1) in all cases, existing instream beneficial stream uses must be maintained, (2) high quality waters must be maintained unless the State decides to allow limited degradation where economically or socially justified (limited degradation is permitted to the extent at which water quality criteria necessary to sustain the national water quality goals uses are maintained); (3) outstanding national resource waters must be maintained and protected and; (4) thermal discharge limitations, as specified under Section 316(a) of the Clean Water Act as amended in 1977, will be considered to be in compliance with this policy. Individual criteria are presented for the states, the District of Columbia, and overseas jurisdictions. (Brambley-SRC)
W81-02022

OTHER ELEMENTS; WATER QUALITY STANDARDS; CRITERIA SUMMARIES; A COMPILATION OF STATE/FEDERAL CRITERIA.
Nalesnik Associates Inc., Washington, DC.
Environmental Protection Agency, Office of Water Regulations and Standards Report, October, 1980. 23 p, 57 Ref. WA-80-A055, 68-01-6058.

Descriptors: *Water quality control, *Water quality standards, *Trace elements, *Metals, Aquatic life, Toxicity, Federal jurisdiction, State jurisdiction, Legislation, Water pollution sources, Irrigation water, Mollusks, Salmonids, Domestic water, Barium, Beryllium, Boron, Chlorine, Manganese, Nickel, Selenium, Silver.

This digest is intended as a general information resource containing excerpts from the individual Federal-State water quality standards for eight elements usually incorporated into State Water Quality Standards. The elements are barium, beryllium, boron, chlorine, manganese, nickel, selenium, and silver. Some sources of these elements in water are given. The EPA's recommended ambient water quality criteria to protect aquatic life and human health are given for each element for the waters for which they have been established. Criteria have been established for barium in domestic water supplies, beryllium in freshwater and irrigation waters, boron in irrigation waters, chlorine for salmonid fish and other freshwater and marine organisms, manganese in domestic water supplies and for protection of consumers of marine mollusks, nickel for freshwater and marine aquatic life, and selenium and silver in domestic water supplies and for marine and freshwater aquatic life. Individual criteria are presented for the states, for the District of Columbia, and for overseas jurisdictions. (Brambley-SRC)
W81-02023

PHOSPHORUS; WATER QUALITY STANDARDS; CRITERIA SUMMARIES; A COMPILATION OF STATE/FEDERAL CRITERIA.
Nalesnik Associates, Inc., Washington, DC.
Environmental Protection Agency, Office of Water Regulations and Standards Report, September, 1980. 16 p, 57 Ref. WA-80-A055, 68-01-6058.

Descriptors: *Water quality control, *Water quality standards, *Phosphorus, Phosphates, *Estuaries, Aquatic life, Toxicity, Inorganic compounds, Federal jurisdiction, State jurisdiction, Legislation, Aquatic plants, Water pollution sources.

This digest is intended as a general information resource containing excerpts from the individual Federal-State water quality standards for phosphorus. The criteria are established to provide a threshold level which when exceeded would most likely result in aquatic life toxicity, due to elemental phosphorus, and excessive aquatic plant growth caused by phosphate phosphorus. The sources of phosphorus in water are given. The 1976 Quality Criteria for Water recommends a phosphorus criterion of 0.1 microgram per liter yellow (elemental) phosphorus for marine and estuarine waters. There is no freshwater criterion. Individual criteria are presented for the states, for the District of Columbia, and for overseas jurisdictions. (Brambley-SRC)

FEASIBILITY OF WATER QUALITY IMPROVEMENT IN THREE ILLINOIS RIVERS.
Arizona Univ., Tucson.
D. C. Wilkin, and R. C. Flemal.
Journal of the Water Pollution Control Federation, Vol 52, No 2, p 293-298, February, 1980. 10 Tab, 4 Ref.

Descriptors: *Water pollution sources, *Illinois, *Rivers, *Water quality, Nitrogen compounds, Phosphorus compounds, Heavy metals, Boron, Chlorides, Copper, Coliforms, Fluorides, Iron, Lead, Manganese, Mercury, Nitrates, Phenol, Sulfates, Zinc, Dissolved solids, Pollutants, Water quality control, Feasibility studies.

Point sources are not the major contributors of pollutant loading in 3 Illinois rivers, the Upper Sangamon and the West and East branches of the DuPage. Therefore, limiting emissions from point sources would not appreciably improve water quality in these rivers without non-point source control. In the Upper Sangamon undefined sources were responsible for 84 to 99% of the total loads of ammonium and nitrate nitrogen, boron, chloride, fluoride, methylene blue active substances, phenol, total phosphorus, sulfate, and a variety of metals. Fecal coliform accounted for in this way was 62%. In the other 2 rivers, fractions were more variable, with higher percentages of metals coming from undefined sources. (Cassar-FRC)

R&D AT EPA: UPHILL RESPONSIBILITIES AND DOWNHILL FUNDING,
D. V. Feliciano.
Journal of the Water Pollution Control Federation, Vol 52, No 3, p 442-448, March, 1980. 2 Fig, 1 Tab.

Descriptors: *Government finance, *Research and development, Technology, Grants, *Water pollution control, Environmental Protection Agency, Anticipatory Research Program.

Research and development within EPA has always dealt primarily with practical studies to support regulation. EPA's Anticipatory Research Program has made it clear that basic research is a vital component of the research and development done by the agency. Now, in the Office of Research and Development, special individual research projects can receive funding under the Innovative Research Program. Also, there is a Science and Technology Achievement Awards program to stimulate basic research. Significant research accomplishments by selected EPA scientists and engineers were cited in 1980, and financial awards presented totaled $30,000. Funding and staffing remain tight for the Office of Research and Development due to funding trends and inflation. (Small-FRC)

REAL-TIME FORECASTING WITH A CONCEPTUAL HYDROLOGIC MODEL. I. ANALYSIS OF UNCERTAINTY,
Iowa Univ. Iowa City. Inst. of Hydraulic Research.
P. K. Kitanidis, and R. L. Bras.
Water Resources Research, Vol 16, No 6, p 1025-1033, December, 1980. 2 Fig, 1 Tab, 19 Ref.

Descriptors: *Statistical methods, Forecasting, *Hydrographs, Discharge measurement, Stochastic processes, *Streamflow forecasting, Probability, *Model studies, Mathematical models, Systems analysis, Methodology, Hydrography, *Real-time forecasting.

The National Weather Service catchment model is a large, nonlinear conceptual model in a mode amenable to analysis of uncertainty and the utilization of real-time information to update system states and improve streamflow predictions. It produces accurate short-term forecasts of river flows from rainfall information in 6 hour intervals and discharge observations . It is based on state space formulation in continuous form, linearization of nonlinear elements, and integration over discrete time periods. Linearization is performed with the uncommon multiple-input describing function technique for most strongly nonlinear responses and Taylor expansion for the rest. Error in the model stems from input uncertainty, parameter uncertainty, the initial state of the system, and model uncertainty. Correction for these errors is performed by updating systems states utilizing Bayes' theorem, stochastic descriptions of the output, and initial probability density functions. (Titus-FRC)

REAL-TIME FORECASTING WITH A CONCEPTUAL HYDROLOGIC MODEL. 2. APPLICATIONS AND RESULTS,
Iowa Univ., Iowa City. Inst. of Hydraulic Research.
P. K. Kitanidis, and R. L. Bras.
Water Resources Research, Vol 16, No 6, p 1034-1044, December, 1980. 9 Fig, 9 Tab, 7 Ref.

Descriptors: *Statistical methods, *Streamflow forecasting, Probability, *Hydrologic models, Forecasting, Discharge measurement, Hydrographs, Mathematical models, Methodology, Hydrography, Systems analysis.

The application of a conceptual hydrologic model to a case study forecasting river discharges in the Cohocton River basin is discussed and evalated. Results indicate that the use of feedback significantly improves the overall forecasting capability of the model even when the model and input error statistics are not perfectly known. Comparison with a linear adaptive black box model strongly favors the conceptual model for longer forecast lead times. The present formulation of the conceptual model neglects timing errors which can appear in the rising limb of a hydrograph. Future research is needed to address uncertainty structure and the problem of compensating for errors in estimating the magnitude and timing of the hydrograph peak. (Titus-FRC)

A LOGICAL APPROACH TO THE DESIGN STORM CONCEPT,
Institute of Hydrology, Wallingford (England).
J. C. Packman, and C. H. R. Kidd.
Water Resources Research, Vol 16, No 6, p 994-1000, December, 1980. 9 Fig, 2 Tab, 12 Ref.

Descriptors: *Streamflow forecasting, *Design criteria, *Urban hydrology, *Design storms, Methodology, Storm drains, Mathematical models, Flood profiles, Simulation analysis, Sewers, Drainage systems, Pipes, Catchment basins, *Flood frequency, Design floods.

The application of sensitivity analysis to the determination of flood return periods and design inputs for peak runoff in given return periods is discussed. Current practice in storm drainage design is to adopt arbitrary storm parameters. Sensitivity analysis determines the antecedent conditions and design storm that consistently give flows which match an observed flood frequency distribution. Sensitivity analysis may be applied to various catchments to determine a stable set of inputs which can be applied generally for design purposes. Input may be generated by continuous simulation or by simulation in probability space, in the absence of sufficient field data. This methodology has been used in the Wallingford model, which was developed for application in the United Kingdom, and which has been calibrated. The methodology has application in designs for natural and urban catchments. (Titus-FRC)

A study was made of marine currents in the area of the proposed Costa del Sol sewage treatment plant using the radioactive tracer, bromine-82. The plant will remove suspended solids and floating solids and will affect two 100 km zones, one to the east and one to the west of Malaga. The waste water will be discharged into the sea, and the study was designed to find the most suitable discharge points. Over a period of two years, 146 tests were carried out. A mathematical model was developed and used to determine dilution at various distances from each discharge point tested. Known data were used to verify the model. (Small-FRC)

Descriptors: *Baseline studies, *Coal mining, *Hydrologic data, Surface waters, Groundwater resources, *Water quality, *Alabama, Mine drainage, Coal mine wastes, Hydrogeology, Data collections, Water analysis, Streamflow, Flow characteristics, Sediment yield, Water wells, Water yield, Water chemistry, Analytical techniques, *Warrior coal field(AL).

Hydrologic data are being collected in four basins in the Warrior coal field in Alabama to provide baseline information to aid in determining the effect mining will have on water resources. Basins monitored are in two different geologic and hydrologic environments. Two basins are underlain predominantly by relatively impermeable indurated rocks in the Pottsville Formation of Pennsylvanian age. The two remaining basins are underlain predominantly by unconsolidated permeable rocks in the Coker Formation of Late Cretaceous age. Well yields from the Pottsville Formation generally range from 0 to 0.3 liter per second, whereas well yields from the Coker Formation generally range form 0.3 to 6.4 liters per second. Streamflow distribution reflects seasonal precipitation. Storm runoff is characterized by sharply concentrated flows of short duration that rapidly recede to low-flow conditions. Streams draining basins underlain chiefly by the Pottsville Formation frequently go dry, whereas those draining basins underlain chiefly by the Coker Formation have well sustained low flows. Water in the Pottsville Formation is slightly acidic and moderately hard to very hard. Dissolved solids concentrations ranged from 176 to 268 milligrams per liter. Water in the Coker Formation is soft, far less mineralized, and more acidic than water in the Pottsville. Surface water is generally soft, acidic and low in dissolved solids concentrations. Water in streams draining basins underlain chiefly by the Pottsville Formation was slightly more mineralized and less acidic than water in streams draining the Coker Formation. (USGS)

BASELINE WATER QUALITY OF SCHMIDT, HORNBEAM, AND HORSESHOE LAKES, DAKOTA COUNTY, MINNESOTA,
Geological Survey, St. Paul, MN. Water Resources Div.
G. A. Payne.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-105645, Price codes: A04 in paper copy, A01 in microfiche. Geological Survey, Water-Resources Investiga-

tions 80-3, 1980. 38 p, 2 Fig, 2 Tab, 8 Ref.

Descriptors: *Baseline studies, *Road construction, *Water quality, *Lakes, *Minnesota, Eutrophication, Water analysis, Chemical properties, Physical properties, Biological properties, Limnology, Data collections, Sampling, Sites, Nutrients, Phytoplankton, Aquatic algae, *Dakota County(MN).

Three lakes in Dakota County, Minn., were sampled five times during an 18-month period to determine baseline water quality prior to construction of an interstate highway. Results of physical measurements and chemical analyses showed that the lakes were shallow, nonstratified, and nutrient enriched. Considerable seasonal variations in dissolved solids, nutrient, and dissolved-oxygen concentrations were observed. Oxygen depletion and high nutrient concentrations were characteristic of conditions under an ice cover in winter. Blue-green algal blooms typically were established soon after ice breakup and persisted until late fall. Data from the study will be supplemented with data collected during and after construction of the highway to assess the impact of highway construction and drainage on water quality of the lakes. DIGITAL MODEL OF THE BAYOU BARTHOLOMEW ALLUVIAL AQUIFER-STREAM SYSTEM, ARKANSAS,
Geological Survey, Little Rock, AR. Water Resources Div.
J. E. Reed, and M. E. Broom.
Geological Survey Open-File Report 79-685, 1979. 94 p, 10 Fig, 13 Tab, 8 Ref.

Descriptors: *Model studies, *Mathematical models, *Alluvial aquifers, *Arkansas, *Water resources development, Groundwater, Surface-groundwater relationships, Forecasting, Potentiometric level, Storage coefficient, Transmissivity, Withdrawal, Irrigation, Mississippi River, Arkansas River, *Bayou Bartholomew.

A digital model of the Bayou Bartholomew aquifer-stream system in Arkansas was calibrated for the purpose of predicting hydrologic responses to stresses of water development. The simulated-time span for model calibration was from 1953 to 1970, during which time the system was stressed largely by ground- and surface-water diversions for rice irrigation. The model was calibrated by comparing groundwater-level and streamflow data with model-derived groundwater levels and streamflow. In the calibrated model, the ratio of model-derived to observed streamflows for 17 subbasins averaged 1.1; the ratios among the subbasins ranged from 0.8 to 1.6. The average deviation of the differences between model-derived and observed groundwater levels at 47 nodes was 0.2; the average among the nodes ranged from -2.3 to 10.4. The average standard deviation of the differences between the model-derived and observed groundwater levels was 3.5; the average among the nodes ranged from 0.4 to 10.5. The model will provide projections of changes in the potentiometric surface resulting from (1) changes in the rate or distribution of groundwater pumpage or (2) changes in the stage of streams and reservoirs. The model will provide only approximate projections of the streamflow. (USGS)

COMPREHENSIVE BASIN-WIDE PLANNING OF SEWER SYSTEMS,
Ministry of Construction, Tokyo (Japan). Dept. of Sewerage and Sewage Purification.
Y. Kameda.
Journal of the Water Pollution Control Federation, Vol 52, No 5, p 884-889, May, 1980. 2 Fig, 1 Tab.

Descriptors: *Sewerage, *Comprehensive planning, *Legislation, Forecasting, Sewers, Water quality, Future planning(Projected), City planning, *Japan.

Comprehensive basin-wide planning of sewer systems in Japan is regulated by the 1970 version of the Sewerage Law. Prefectural governments are required to develop comprehensive sewerage programs which will help the area meet necessary water quality standards. Public waters requiring basin-wide planning are those that are polluted with discharges from two or more municipalities and for which water quality protection cannot be attained without the construction of a sewer system. The first step in planning is the determination of allowable load from the existing load at the source, the existing discharged load, and the ambient loads of the receiving body of water. Future pollution loads are estimated, and the required load reduction is determined. Naturally it is difficult to determine all of these parameters precisely, but strict precision is not necessary for basic planning. The required waste water treatment process level is then calculated. Urban areas with a population density of 40 persons/ha or more must be covered by such plans. Alternative waste water treatment options are always considered. (Small-FRC)

STOCHASTIC APPROACH TO WASTE TREATMENT PLANNING,
Utah Water Research Lab., Logan.
R. D. Hansen, A. B. Bishop, and R. Narayanan.
Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers, Vol 106, No WR1, p 275-287, March, 1980. 3 Fig, 5 Tab, 11 Ref.

Descriptors: *Stochastic processes, *Waste water treatment, *Planning, Model studies, Ashley Valley, *Utah, Mining, Population, Decision making, Mathematical models, Economics, Water resources development, Agriculture.

Planning public works, such as waste treatment plants, for areas facing uncertainty in economic events and population size is difficult. In the model described in this paper, a stochastic futures submodel, structured as a first-order Markov chain, is linked to a decision model. The model is applied to a study of Ashley Valley, Utah, an isolated rural area with uncertain growth prospects. Tables are developed listing 3 types of possible development (oil shale, a water resource and agricultural water project, and tar sands and phosphate mining) and 3 possible years (1980, 1985, 1990). This information, plus the costs of 4 sizes of waste water treatment units and damages caused by discharging untreated effluent, are used to determine the most cost-effective sizing and sequencing of waste treatment for the Ashley Valley area. (Cassar-FRC)

FAIRNESS CONSIDERATIONS AND ALTERNATIVE POLICIES,
Duke Univ., Durham, NC. Dept. of Civil Engineering.
J. J. Peirce, E. F. Joeres, and M. H. David.
Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers, Vol 106, No WR1, p 81-87, March, 1980. 9 Ref.

Descriptors: *Planning, *Alternative planning, *Fairness, *Decision making, Administration, Management, Methodology, Water pollution, Phosphorus compounds, Wisconsin.

This paper offers aid to water resource planners in generating fair alternative solutions to problems within the scheme of rational planning. Some fair solutions are based on the following definitions: contractural agreement (example, a group of industrial polluters jointly contract with a party to remove the undesirable material), precedent (any plan enacted in the past for a similar problem), market system (enables participants to interact in the open market and achieve a competitive price equilibrium), egalitarianism (all polluters are treated equally and must meet the same emission standards). Groups of equals are treated equally within the group, but unequal groups are treated according to need, worth, ability to pay, who receives benefits, and existing technology. Seventeen alternatives were developed to help solve the phosphorus problem in Wisconsin. Advantages of this method are (1) it allows for development of truly different alternatives, (2) it is efficient and flexible, (3) it complements existing problem-solving methods. (Cassar-FRC)

ENERGY CRITERIA FOR WATER USE,
Florida Univ., Gainesville. Center for Wetlands.
F. C. Wang, H. T. Odum, and R. Costanza.
Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers, Vol 106, No WR1, p 185-203, March, 1980. 10 Fig, 3 Tab, 24 Ref.

Descriptors: *Water resources development, *Energy, *Mathematical models, Water management, Water utilization, Energy budget, Energy transfer, Flow, Model studies, Land use, Energy loss, Simulation analysis, Economics, Ecosystems.

The problems of land and water management have been addressed by a synthesis of theories from energy analysis, ecology and economics to arrive at optimum management techniques. It was assumed that water resources could be assessed in terms of their embodied energy content, which was calculated as the amount of energy required directly and indirectly to generate the flow in processes of the biosphere or a typical desalination plant. The flow produced by water use in an agricultural system or an urban economy was used to calculate the energy effect of water. The energy effect of water was compared with its embodied energy. An energy-quality value was utilized to put environmental and economic variables in a comparable unit. The general objective function of this unit was the maximum power principle, a self-organizing and optimizing criterion. A land use model representing the major land-use systems (agricultural, natural, industrial, and urban) was constructed and transformed into a standard linear programming problem. Parametric analysis was employed to obtain simulation results. The energy terms and concepts presented were recommended for use in organizing large ecosystems and in making decisions on water resource management in terms that may be easily compared with other questions on energy storage and supplies. Journal of the Water Resources Planning and Management Divsion, Proceedings of the American Society of Civil Engineers, Vol 106, No WR2, p 451-466, July, 1980. 4 Fig, 6 Tab, 21 Ref.

Descriptors: *Decision making, *Environmental effects, *Power plants, Land use, *Energy, Planning, Natural resources, Flood plains, Mathematical studies, Economics.

Two powerplant sites are evaluated by energy analysis to determine minimum loss of economic potentials and depletion of natural resources. Many of the terms in the energy equations pertain to the energy inherent in various forms of water, e.g., rain, streams and floods. The examples illustrate the environmental impact of the powerplants on different types of land converted to powerplant and cooling pond use--agricultural land or forested flood plain. The optimum choice of plant location is the forested flood plain if it is based on the loss

to the economy of total environmental energy flows; and the agricultural land if the decision is based upon depletion of natural resources. (Cassar-FRC)

J. W. Eheart.
Water Resources Research, Vol 16, No 6, p 980-986, December, 1980. 3 Fig, 1 Tab, 12 Ref.

Descriptors: *Biological oxygen demand, *Permits, *Cost comparisons, Project planning, Water policy, Administrative agencies, Costs, Economics, Analysis, Cost-benefit ratio, Water quality.

The process of designing a system of transferable discharge permits is discussed and four proposed systems for biological oxygen demand control are compared to least-cost and minimum uniform treatment strategies for achieving the same water quality. Transferable discharge permit systems treat discharges as pollution rights which can be bartered and purchased. A system must include assurance of favorable environmental outcome, administrative simplicity, equity, and cost minimization. The four proposed policies each establish a dissolved oxygen impact coefficient and a definition basis for the permit. Mathematical models are generally required. All four versions of the transferable discharge permit were found to be cost efficient and below the minimum uniform treatment cost. Further research is needed to determine if the salient statistical properties of the systems are typical over a wide range of rivers and other water courses. Legal feasibility, procedures for enforcement, and detailed administrative structures must also be determined. (Titus-FRC)

FINANCING WASTE WATER TREATMENT IN JAPAN,
Ministry of Construction, Tokyo (Japan). Dept. of Sewerage and Sewage Purification.
K. Inaba.
Journal of the Water Pollution Control Federation, Vol 52, No 5, p 878-883, May, 1980. 1 Tab.

Descriptors: *Financing, *Government finance, *Treatment facilities, Bond issues, Cities, Waste water treatment, Construction costs, Operating costs, Maintenance costs, *Japan.

The past and present financing practices and the current financial structure of waste water treatment in Japan are described, and the prospects for the future are discussed. The Research Committee on Sewage Works Financing has recommended various financing schemes to meet the cost for construction of waste water treatment facilities and operating and maintenance costs. These involve some combination of government subsidies, assessments, and municipal funds. The present fiscal policy emphasizes public service. Every household in an area where sewerage is available is required by law to use it. Sixty percent of the total construction costs of public sewerage facilities are eligible for central government subsidy. This subsidy covers two-thirds of the construction costs of the plant and six-tenths of the construction costs of the sewers. Local government bonds cover 85% of the subsidized part. Ninety-three percent of total regional facility construction costs are eligible for government subsidy. Ninety percent of non-subsidized costs are covered by bond issue. (Small-FRC)

SEWER USER CHARGES IN OSAKA,
Japan Water Works Bureau, Osaka.
K. Takesada.
Journal of the Water Pollution Control Federation, Vol 52, No 5, p 985-991, May, 1980. 2 Fig, 5 Tab.

Descriptors: *Waste water treatment, *Sewerage, *Use rates, Prices, Osaka, *Japan, Maintenance costs, Operating costs, Cost sharing, Costs, Rates, Planning, *Water rates.

The city of Osaka has the highest population density in Japan, 2.7 million per 184.1 sq km area. Operation and maintenance costs for its sewer system, which serves 97.3% of the total city population, were 21 billion yen in fiscal 1979 (210 yen = 1 U. S. dollar), and capital costs including interest and depreciation, 22.3 billion yen. Sewer user charges began in 1920 and have been changed several times. The latest revision in 1972 changed the meter-rate system to the progressive-rate system in which a unit price per 1 cu meter increases with quantity of water used. A water quality surcharge, accounting for 4% of the sewer use revenues, is applied to substances that can be treated at treatment facilities, waste water of poorer quality than domestic waste water, and waste water approved by the city. Future plans include advanced treatment for water discharges into lakes and ponds, reuse of secondary effluent and sludge, and energy-saving measures. (Cassar-FRC)

6D. Water Demand

OUTDOOR RECREATIONAL USE AND PARTICIPATION INVENTORY OF THE LAKE MEAD NATIONAL RECREATION AREA,
Arizona State Univ., Tempe. Dept. of Leisure Studies.
G. W. Greey, G. W. Cheatham, and R. J. Virden.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-178378, Price codes: A18 in paper copy, A01 in microfiche. Technical report prepared for the Water and Power Resources Service, November, 1980. 412 p, 327 Tab, 2 Append. 14-06-300-2532.

Descriptors: *Recreation, *Reservoirs, *Use rates, *National Recreation Areas, Boating, Camping, Swimming, Sport fishing, Water utilization, Arizona, Nevada, *Lake Mead National Recreation Area.

For purposes of study and data collection, the Lake Mead National Recreation Area (LMNRA) was geographically divided into two separate regions: Lake Mead and Lake Mohave. The period of study was January 1, 1979 through December 31, 1979. Random sampling techniques were used to determine specific periods of data collection. During the study year, a total of 674,383 recreation units visited the Lake Mead Region, and 234,804 visited the Lake Mohave Region for a combined total of 909,187 units visiting the LMNRA during the study year. The projected number of visitors was 2,282,322 for the Lake Mead Region, and 775,861 for the Lake Mohave Region for a combined total of 3,058,182 during the same period. By rank order and frequency, visitors to the LMNRA participated in picnicking (2,919,272), swimming/related (1,898,913), boating (728,352), point of intermittent visit (702,460), camping (665,151), fishing (333,571), boat camping (138,659), houseboating (90,642), and a variety of other activities (143,039 combined). Lake Mead accounted for 54.8% of all water based participation while Lake Mohave accounted for 45.2% of all water based participation within the LMNRA during the study year. Combined water based participation totalled 881,953 or approximately 13% of all visitor participation. By rank order preference, Lake Mead visitors participated in swimming (228,950), fishing (101,283), and boat camping (60,617). Lake Mohave visitors participated in swimming (193,951) fishing (103,962), and boat camping (78,042) during the same period. (Moore-SRC)

THE ELEMENTS OF QUALITY AND SOCIAL COSTS IN RURAL WATER SUPPLY AND UTILIZATION,
Ibadan Univ. (Nigeria). Dept. of Geography.
F. O. Akintola, O. Areola, and A. Faniran.
Water Supply and Management, Vol 4, No 4, p 275-282, 1980. 1 Fig, 7 Tab, 5 Ref.

Descriptors: *Water resources development, *Rural areas, *Surveys, Wells, Water quality, Water utilization, Water demand, Water distribution, Agriculture, Social aspects, Water requirements, Ponds, Domestic water, Future planning, *Water costs, Water supply, Nigeria.

A survey was taken of village households in Ibarapa, Oyo State, Nigeria to determine water use patterns as background information for use in planning rural water supply improvements. The survey sought data on the size of each household, number of livestock, daily water requirements, sources of water during various seasons, water use from each source, and social and economic costs of rural water supplies. Oyo state lies between the Ogun and Oyan rivers, and only four settlements in the area have pipeline water supplies. The main occupation of the villagers is farming. Springs and ponds provided most of the people's water needs, which averaged a maximum of 26.1 liters/individual/day. Wells and dugout stream beds were more important as sources of water during the dry season. Definite preferences of water sources were shown for different household uses. On the average one hour was spent for each round trip to the water source during the wet season, while double that amount of time was needed to fetch water during the dry season. The most common waterborne disease among the villagers was guineaworm infection, which caused an average of 126 lost work days per year. Dysentery, rheumatism, cough and other ailments were also linked to water supplies and added to the number of work days missed. It was deduced that pipeline water supplies to rural areas would increase the number of manhours alloted to farm work by reducing the time spent fetching water and by reductions in work days lost due to water-borne diseases. Since the Savanna region of Ibarapa supplies most of Nigeria with food from its agriculture, the possible economic consequences of improved rural water supplies for the whole population of this nation should be considered. RAND WATER BOARD,
Rand Water Board, Johannesburg (South Africa).
R. J. Laburn.
Imiesa (Johannesburg), Vol 4, No 5, p 48-49, 51, May, 1979. 3 Fig.

Descriptors: *South Africa, *Rand Water Board, *Vaal River, *Water supply, Reservoirs, Water distribution(Applied), Water supply development, Water treatment, Water management(Applied), Water purification, Water rates, Pumping, Utilities, Water delivery.

The Rand Water Board, organized in 1903, is a non-profit, autonomous public utility that supplies water in bulk to municipalities and other local authorities, to the mining industry, and to the South African Railways of the Witwatersrand area of South Africa. In 1923 the Board built the Barrage in the Vaal River in cooperation with the Department of Water Affairs. The Board is allowed to abstract, in perpetuity, 886, 470 cu m of water per day for no cost. The Board also abstrats additional water from the reservoir for a fee. The Board has two main water purification stations on the Vaal River. The stations use chemical coagulation, sedimentation, filtration, and disinfection. Continuous pumping is then used to move the purified water to the central Witwatersrand divide where it gravitates to northern, eastern and western regions. Local water authorities are responsible for boosting the water to their highest lying urban areas. The Rand Board's service reservoirs maintain a 36 hour supply with consumers being required to draw water at a near uniform rate. Consumer rates apply uniformly with no variations due to supply or location. The Board currently has two developments underway to ensure its continuing performance. (Seigler-IPA)

DURBAN'S WATER SUPPLY,
Durban City Engineer's Dept. (South Africa).
D. C. Macleod.
Imiesa (Johannesburg), Vol 4, No 5, p 37-41, May, 1979. 3 Fig, 1 Tab.

Descriptors: *South Africa, *Durban, *Water supply, *Water sources, Urbanization, Water resources, Gravity, Metering, Water demand, Population, Water storage, Silting, Diversion, Dams, Planning.

The Borough of Durban, South Africa has had various water sources since its declaration in 1854 including primitive wells, the Umbilo River, the Umhlatuzana River, the Umlaas River, and the Umgeni River. The area has been troubled by heavy siltation of its reservoirs and currently uses a three-dam system composed of the dams at Nagle, Nidmar, and Albert Falls. A universal metering program started in 1970 produced an overall reduction in demand and a period of recession has further reduced demand. Despite these reductions in demand, it is estimated that in the 1990's the assured yield of the Umgeni River will not meet the requirements of the area. One possible new water source would be the diversion of the upper waters of the Umkomaas River into the head waters of the Ungeni River. This is considered desirable as it would permit gravity supply to the Durban Metropolitan Area. Another possibility is drawing water from the Illovo River and diverting the lower reaches of the Unkomaas River. (Seigler-IPA)

WATER IN THE ENVIRONMENT: THE UNEP EXPERIENCE,
United Nations Environment Programme, Nairobi (Kenya).
L. E. Obeng.
Water Supply and Management, Vol 4, No 3, p 155-170, 1980. 18 Ref.

Descriptors: *Reviews, *Water resources development, *United Nations, Water quality, Water supply, Water pollution, Water reuse, Governments, Hydrology, Rural areas, Cities, Organizations, Water management, Education, Social aspects.

The importance of water to all life forms, productivity, and the quality of life is reviewed, along with the activities of international agencies that seek to enhance the quality and services afforded by the earth's water resources. Many United Nations (UN) agencies are in existence which deal with the use of water at the domestic, industrial, and agricultural levels. Since the first UN Conference on the Human Environment, major world conferences have taken place that have emphasized topics related to water. The UN Environment Program (UNEP) Governing Council has been described as the central institution for environmental matters in the UN. Other agencies involved with water programs are the Center for Natural Resources, Energy and Transport, UNESCO's International Hydrological Program, FAO, WHO and about 25 other groups. Many of the programs of these agencies focus on some aspect of water quality or quantity. Other groups focus their activities on water pollution, irrigation, and data collections on general hydrology. The work of the agencies aids the UN in concentrating social efforts in developing countries in areas where they are most needed. Surveys conducted in 91 developing nations by the Governing Council have shown that 78% of 313 million people in rural areas and 23% of 450 million people in urban areas were without adequate water supplies. Improvements in water quality in third world nations have lessened the spread of water-borne diseases. The development of dams and irrigation systems in these nations has also helped to increase the acreage of farmable land and with it, food supplies. Certain UN agencies, especially UNICEF and UNEP, are involved in the education and training of individuals in the skills of water management. (Geiger-FRC)

DROUGHT MITIGATION STRATEGY: CONJUNCTIVE USE IN SMITH VALLEY, NEVADA,
Nevada Univ. System, Reno. Desert Research Inst.
A. S. Navoy, G. F. Cochran, and D. F. Schulke.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-173957, Price codes: A05 in paper copy, A01 in microfiche. Publication No 41069, 1980. 66 p, 18 Fig, 15 Tab, 41 Ref. OWRT-A-081-NEV(1), 14-34-0001-8030.

Descriptors: *Droughts, *Conjunctive use, *Hydrologic models, *Groundwater management, Water shortage, Water rights, Institutional constraints, Irrigation water, Legal aspects, Economic aspects, *Water law, *Nevada, Smith Valley(NV).

The surface irrigation water supplies of Smith Valley in Westcentral Nevada are susceptible to drought. The utilization of conjunctive groundwater for drought mitigation was estimated by converting electrical energy consumption of irrigation wells into total amount of water pumped. The amount of actual conjunctive groundwater pumped was separated from the total pumpage by contrasting pumping in the non-drought years of 1974 and 1975 to the drought years of 1976 and 1977. A lumped parameter systems model was developed for Smith Valley, based upon the characteristics and interrelationships of the water resources system. Various conjunctive pumping management schemes were modeled to investigate improving the drought mitigation capability. Due to the water cost framework, the management schemes simplify to increases in the allowable conjunctive pumpage. The model results indicated that a doubling of the present conjunctive groundwater rights would not manifest itself as a significantly greater groundwater storage deficit.

THE JAPAN SEWAGE WORKS AGENCY - ITS ROLE AND ACTIVITIES,
Japan Sewage Works Agency, Tokyo.
T. Kubo.
Journal of the Water Pollution Control Federation, Vol 52, No 5, p 873-877, May, 1980. 6 Tab.

Descriptors: *Treatment facilities, *Research and development, *Sewerage, Technology, Construction, Operation and maintenance, Institutions, Costs, Government, Legal aspects, *Japan.

The responsibilities of the Japan Sewage Works Agency (JSWA), established by the Japan Sewage Works Agency Act, include the construction, operation, and maintenance of public sewer systems. The agency aids local governments in improving sewer systems by training waste water engineers, offering technical assistance, and sponsoring research and development of water pollution control techniques. The costs of JSWA are borne equally by local and federal governments. JSWA has a

council which considers JSWA operating procedures and a board of directors which meets twice a year. JSWA has been primarily engaged in design and construction of waste water treatment plants under consignment agreements with local governments. Local governments make advance payments to the agency to cover agreed-upon costs. Upon completion of the project, JSWA conducts extensive tests, and once the project has been approved, further costs are split between the agency and local government. The Research and Technology Division conducts research, surveys, and tests for technological development. There is also a New Technology Evaluation Committee. (Small-FRC)

A SYNOPSIS OF PERSPECTIVES ON THE INNOVATIVE AND ALTERNATIVE TECHNOLOGY PROGRAM,
Maryland Univ., College Park. Dept. of Civil Engineering.
J. E. Alleman, and P. S. Price.
Journal of the Water Pollution Control Federation, Vol 52, No 3, p 460-464, March, 1980. 10 Ref.

Descriptors: *Federal Water Pollution Control Act, Technology, *Government finance, Recycling, Costs, Energy conservation, Grants, Research and development, Cities, Alternative technology, *Water reuse.

The Clean Water Act of 1977 includes a segment promoting the use of innovative and alternative (I/A) technology 'to force technology so that new and better alternatives which have not been demonstrated can become available'. The three primary objectives of such technology are: recycling and reuse of water and waste materials, energy conservation and recovery, and cost reduction. Incentives for I/A technology applications include an increase in the federal contribution for design and construction from 75 to 85%. If the system fails within two years, the municipality is guaranteed sufficient funds to repair or replace the unit. There has been some congressional displeasure with the constructions grant program, and changes may develop. The public has protested against the program because of excessive operations and maintenance costs, which have led to higher user costs. The program has not been successful in its attempts to move the engineering community towards alternative technology. (Small-FRC)

PROBLEMS IN APPLYING OPTIMAL IRRIGATION PLANS,
Idaho Univ., Kimberly. Dept. of Civil and Agricultural Engineering.
C. E. Brockway, and R. G. Allen.
Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers, Vol 106, No WR1, p 255-263, March, 1980. 2 Tab, 8 Ref.

Descriptors: *Irrigation systems, *Planning, *Teton Dam, *Optimization, Water rights, Water law, Open channels, Conveyance structures, Irrigation canals, Irrigation ditches, Canals, Water conveyance, Irrigation districts, Idaho, Dynamic programming, Linear programming, Salem Irrigation District, Efficiencies, Costs, Dam failure, Rehabilitation.

After the Teton Dam collapse in 1976 destroyed or damaged 65 irrigation districts in eastern Idaho, a limited time was available to plan for rehabilitation and updating irrigation systems. Inputs for the planning methods were cost coefficients and efficiencies for distribution and application system components. First, dynamic programming was used to build least-cost, efficient, distribution-system component configurations composed of lined and unlined channels and pipe sections using a branch and bound decision technique. Then linear programming was used to obtain least-cost system plans for the entire system. As an example, details for the 3,170 acre Salem Irrigation district are described. In this area, unlined channels with high seepage rates are used for subirrigation. Efficiencies, application, and energy costs are listed for 8 combinations of irrigation systems--sub-irrigation, unimproved furrow and border, improved furrow and border, and 3 types of sprinklers. Some of the constraints involved with planning this system were replacement with in-kind structures, farmer acceptance, jeopardization of water rights, increasing inflation, and energy costs. 6G. Ecologic Impact Of Water Development

IMPACT OF STREAM ALTERATIONS ON RIPARIAN COMMUNITIES IN SOUTHCENTRAL OKLAHOMA,
Oklahoma State Univ., Stillwater. Dept. of Ecology, Fisheries and Wildlife.
J. S. Barclay.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-166886, Price codes: A06 in paper copy, A01 in microfiche. Fish and Wildlife Service, Biological Services Program Report FWS/OBS-80/17, August, 1980. 105 p, 11 Fig, 35 Tab, 57 Ref. 14-16-0008-2039.

Descriptors: *Stream improvement, *Channeling, Land use, *Wildlife, *Vegetation, *Environmental effects, *Oklahoma, Wildlife habitats, Birds, Mammals, Amphibians, Reptiles, Impoundments, Riparian plants, Grasslands, Aquatic habitats, Erosion.

Concern over continuing losses of productive riparian wildlife habitat to extensive channelization and impoundment activities in the southern grasslands, plus a lack of regional information on alteration effects led to this study of stream alteration in Oklahoma. Two channelized streams, Rush and Wildhorse Creeks, and one impounded stream, Cobb Creek, were selected for study: they are all major tributaries of the Washita River within grassland ecoregions. Intensive plant and animal surveys were conducted on survey sites along 150 km of the streams. Channelization and land use changes along the two prairie streams resulted in or facilitated extensive loss and degradation of aquatic habitat; complete destruction of wetlands; nearly complete elimination of the bottom land forest; accelerated erosion; and reduced plant and animal species richness, diversity, and relative abundance. Land use was usually the most apparent factor determining vegetation differences between sites. Although the data on impoundment effects are conflicting from one life group to another, there appears to be a general tendency toward lower species diversity and higher relative abundance on the downstream sites, which may reflect the stabilized downstream flow. Exceptional care must be taken to minimize subsequent erosion and loss of adjacent riparian plant and animal communities when channelization is authorized for prairie streams. (Moore-SRC)

ENVIRONMENT AND WATER DEVELOPMENT IN THIRD WORLD,
Biswas and Associates, Ottawa (Ontario).
A. K. Biswas.
Journal of the Water Resources Planning and Management Divsion, Proceedings of the American Society of civil Engineers, Vol 106, No WR1, p 319-332, March, 1980. 2 Tab, 26 Ref.

Descriptors: *Planning, *Water resources development, *Resources development, Social aspects, Environmental aspects, Africa, Aswan Dam, Sedimentation, Public health, Agriculture, Irrigation systems, Diseases, Aquatic weeds, India, Third World.

This paper discusses the social and environmental effects of water development in the third world under three categories--physical, bilogical, and human effects. The positive and negative environmental effects of several water resource development projects are discussed--Egypt's Aswan Dam, India's Koyna Dam, irrigation systems and agriculture throughout the world. On a global scale 20 million square km of soil, or 35% of the currently used arable land, has been destroyed or degraded by poor management. Similarly, water development projects can affect the biological subsystem in beneficial or adverse ways. Although safe drinking water dramatically reduces the incidence of many water-borne diseases, irrigation projects in tropical regions can spread diseases such as schistosomiasis, liver fluke and malaria into new areas and promote growth of undesirable aquatic weeds in waterways. Potable water made easily available to a rural population can improve the life of the water-gatherers, 90% of whom are women. It is not unusual for a person to spend 5 hours every day hauling water. This wastes productive time, uses up dietary calories, and exposes the carriers to disease vectors. However, severe social problems may result when a large population is forced to move out of the path of a dam inundation. The planning processes must be sensitive to social and environmental guidelines, or the overall strategy may be self-defeating. (Cassar-FRC)

AN ORGANIC MONITORING SYSTEM FOR THE OHIO RIVER,
R. C. Kroner.
Public Works, Vol 111, No 5, p 81-84, May, 1980. 2 Fig, 4 Tab.

Descriptors: *Ohio River, *Monitoring, *Organic compounds, Water pollution sources, Carbon tetrachloride, Solvents, Water quality, Water quality control, Public health, Industrial wastes, Water pollution, Water analysis, Sampling, Gas chromatography, Rivers.

During the winter of 1976-1977, when increased levels of carbon tetrachloride were found in the Ohio River, it became apparent that an early detection and monitoring system for haloform organics was needed to protect the public from these pollutants. The Ohio River Valley Water Sanitation Commission (ORSANCO) in cooperation with the US EPA began using 8 semiautomated gas chromatographs along strategic points of the river to check the level of haloform organics during the first phase of an extensive monitoring plan. A raw water sample is subjected to purge-and-trap treatment in the daily analysis, and unknown organics may be identified by more extensive processes. In 1978 when the program first became operative, it was plagued by problems of untrained operators, equipment failures and lack of maintenance funds. However, the system was successful in detecting high levels of chloroform and carbon tetrachloride at the Kanawha River monitoring station, and the discharge problem was rectified after questioning the suspected discharging companies. In the second year of operation, specific discharge patterns of organics at each monitoring station were noted. Once a month duplicate samples are shipped to consulting laboratories, where they are analyzed by GC/MS as a quality control check. The addition of a second detector to handle purgeable non-halogenated compounds will greatly extend the monitoring capacity of the network. Other recommendations for more efficient river surveillance include increased sampling frequency and computerized data handling. (Geiger-FRC)

HYDROLOGIC NETWORKS: INFORMATION TRANSMISSION,
British Columbia Univ., Vancouver. Dept. of Civil Engineering.
W. F. Caselton, and T. Husain.
Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers, Vol 106, No WR2, p 503-520, July, 1980. 4 Fig, 3 Tab, 9 Ref.

Descriptors: *Hydrologic systems, *Network design, *Information exchange, Communication, Stations, Design, Data collection, Shannon information theory, Gaging stations, Sites, Synthetic

hydrology, Optimization, Vancouver, British Columbia.

A hydrological data collection network can be assessed by using information theory. The Shannon information theory is applied to this case (daily point precipitation) and is used to provide an optimization criterion for networks. An example is a 10-station 'temporary' network in the Vancouver, British Columbia, region, which experiences significant precipitation variations within the area. The method can compute the optimal number and sites for location of permanent stations. There are several advantages to using information transmission in network design. Stations of a network are assessed by their joint information conveying capabilities, not by summation of individual capabilities. Since there is no theoretical limit on the number of types of data, design of multipurpose networks is possible. (Cassar-FRC)

7B. Data Acquisition

ESTIMATION OF THE DOWNSTREAM RIVER WATER QUALITY WITH A POLLUTION LAND-USE DATA BANK,
Institut National de la Recherche Scientifique, Rimouski.
D. Couillard, and D. Cluis.
Water Supply and Management, Vol 4, No 4, p 263-268, 1980. 2 Fig, 3 Tab, 9 Ref.

Descriptors: *Monitoring, *Water quality, *Land use, Eutrophication, Nutrients, Nitrogen, Phosphorus, Model studies, Drainage area, Vegetation, Industrial wastes, Water pollution sources, Data storage and retrieval, Municipal wastes, River basins, Farm wastes, Data collections, *Quebec.

In order to alleviate expenditures associated with repetitive monitoring programs, a nutrient-oriented land use data bank based on information from the Mercator square-grid drainage system and from the Canadian Bureau of Statistics (vegetation coverage, land use, population, agriculture, industry) was developed. The bank served as a simple nutrient (nitrogen and phosphorus) transport model, which was tested on the Yamaska River basin, an intensive agricultural area of Quebec, to determine the relative importance of different pollution sources. Industrial pollution information was obtained from Scott's Industrial Directory, and a range of anticipated specific nutrient contributions was established based upon available data in the literature. Point-source polluters are associated directly to their outfall sub-basin unit, and non-point-source-polluters are distributed to the square-grid in proportion to the areas of the municipalities. The model showed good agreement with previous studies of nitrogen and phosphorus transport, and it was also useful in predicting the impact of treatment plants on nutrient loadings. (Geiger-FRC)

SURFACE WATER INVENTORY THROUGH SATELLITE SENSING,
National Remote Sensing Agency, Hyderabad (India).
S. Thiruvengadachari, P. S. Rao, and K. R. Rao.
Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers, Vol 106, No WR2, p 493-502, July, 1980. 6 Fig, 1 Tab, 5 Ref.

Descriptors: *Remote sensing, *Surface waters, *Water resources, Impoundments, Water storage, Data collections, *Satellites(Artificial), Tamil Nadu, India, Lakes, Storage, Surveys, Hydrologic data, Measurement, Monitoring, Mapping, Areal.

Satellite sensing was used to monitor area and volume of 17 major reservoirs in Tamil Nadu State, India, to determine the feasibility of estimating water volumes in ungaged lakes used for domestic and irrigation water supplies. Information from Landsat, a sun-synchronous near-polar orbiting satellite, was used in regression analysis, which compared ground-based with satellite-derived waterspread area and satellite-derived area with ground-measured water volume. The correlation rate between waterspread areas obtained from satellite and ground observations was 96.6%. The satellite-derived waterspread area accounted for 83% of the variation in storage volume. Thus, storage volumes for an area of ungaged lakes can be estimated from a second regression equation. These estimates are more meaningful for a large area than for an individual lake. (Cassar-FRC)

Available from the OFSS, USGS Box 25425, Fed. Ctr., Denver, CO 80225, Price: $5.25 in paper copy, $1.00 in microfiche. Geological Survey Open-File Report 80-584 (WRI), June, 1980. 2 Sheets, 7 Ref.

Descriptors: *Maps, *Groundwater, *Aquifer characteristics, *Water wells, *Arizona, Springs, Water levels, Water utilization, Irrigation, Water quality, Specific conductivity, Fluorides, *Hassayampa area(AZ), Maricopa County(AZ), Yavapai County(AZ).

The Hassayampa area includes about 1,300 square miles in west-central Arizona. The area consists of basins filled with alluvial deposits and mountains composed of crystalline and consolidated sedimentary rocks. The main water-bearing unit is the alluvial deposits, which consist of gravel, sand, silt, and clay. Other water-bearing units consist of crystalline and consolidated sedimentary rocks that may yield a few gallons per minute. In 1978 about 3,000 acre-feet of ground water was withdrawn from the area. Information shown on the maps includes depth to water, altitude of the water level, well depth, specific conductance, and fluoride concentration. Scale 1:125,000. (USGS)

HYDROLOGIC DATA FOR OKALOOSA, WALTON, AND SOUTHEASTERN SANTA ROSA COUNTIES, FLORIDA,
Geological Survey, Tallahassee, FL. Water Resources Div.
J. R. Wagner, C. Lewis, L. R. Hayes, and D. E. Barr.
Available from the OFSS, USGS Box 25425, Fed. Ctr., Denver, CO 80225, Price code: $30.50 in paper copy, $3.50 in microfiche. Geological Survey Open-File Report 80-741, 1980. 228 p, 26 Fig, 20 Tab, 20 Ref.

Descriptors: *Hydrologic data, *Water quality, *Groundwater, *Surface waters, *Florida, Groundwater resources, Aquifers, Water wells, Test wells, Water level fluctuations, Pumping, Water yield, Rainfall, Hydrographs, Streamflow, Chemical analysis, Maps, Evaluation, *Okaloosa County(FL), *Walton County(FL), *Santa Rosa County(FL).

This report presents hydrologic and water-quality data collected within Okaloosa, Walton, and southeastern Santa Rosa Counties in northwest Florida. The data are presented in graphs and tables. Groundwater data include descriptions of wells and test holes, analyses of water quality, water level measurements, hydrographs of water levels and chloride concentrations in wells open to the upper part of the Floridan aquifer, and municipal and federal facilities pumpage. Surface-water data include streamflow measurements, streamflow hydrographs and analyses of water quality at selected stations. Maps of the area show locations of wells and surface-water stations. THE ASPHALTIC CONCRETE LINING OF A RESERVOIR IN THE EASTERN TRANSVAAL,
Ove Arup and Partners (South Africa).
G. W. Plant, D. R. Priest, and A. R. Landby.
Civil Engineer South Africa, Vol 22, No 9, p 243-249, September, 1980. 9 Fig, 1 Tab, 10 Ref.

Descriptors: *Reservoir construction, *Reservoirs, *Reservoir leakage, Design criteria, Watertight, Prototypes, Materials engineering, Projects, Seepage, Water loss, Technology, Economics, Operation and maintenance, Resources development, Testing, Concrete mixes, *Asphaltic concrete, South Africa.

The design and construction of a raw water storage reservoir in South Africa is described. The reservoir is situated in the Eastern Transvaal and has a generating capacity of 3600 megawatts. The reservoir has two compartments with a total capacity of 885,000 cubic meters which provide storage equivalent to five days demand. This is the first reservoir in South Africa to use hydraulic asphalt concrete as the lining material. Advantages of this material are that with a multi-layer application weaker areas are covered by the use of staggered joints and irregularities can be leveled out. Disadvantages are that in some climates rapid cooling of thin layers occurs, and imperfect fusion may produce blisters and entrap moisture. The mix adopted for the South African reservoir was designed to meet the conflicting requirements of impermeability, flexibility and stability on the reservoir slopes. (Titus-FRC)

DEVELOPMENT OF AN URBAN HIGHWAY STORM DRAINAGE MODEL BASED ON SWMM,
Camp, Dresser and McKee Inc., Springfield, VA.
R. J. Dever, Jr., and L. A. Roesner.
Available from the National Technical Information

Service, Springfield, VA 22161 as PB81-173858, Price codes: A11 in paper copy, A01 in microfiche. In: Proceedings, Stormwater Management Model (SWMM) Users Group Meeting, 19-20 June, 1980, Toronto, Ontario, Environmental Protection Agency Report EPA 600/9-80-064, December, 1980, p 121-132. 2 Fig, 8 Ref.

Descriptors: *Urban drainage, *Highways, *Model studies, *Storm runoff, Urban runoff, *Storm drains, Drainage systems, Computer programs, Water quality, Precipitation(Atmospheric), Hydraulic design, Flow, Cost analysis.

The Urban Highway Storm Drainage Model consists of a powerful and flexible set of computer programs for highway drainage analysis and design. The capabilities of the model include statistical analysis of rainfall records, design of drainage systems including locating inlets and sizing pipes, analysis of drainage systems under extreme storm events, and simulation of runoff quality from the highway corridor. The model consists of four related but independent modules: Precipitation Module, Hydraulics/Quality Module, Analysis Module, and Cost Module. The Precipitation Module can perform a variety of statistical analyses on long-term hourly precipitation data and generate design storm hyetographs. The Hydraulics/Quality Module simulates time-varying runoff quantity and quality, locates stormwater inlets and sizes the conduits of the major drainage system. The Analysis Module simulates unsteady gradually-varied flow in the drainage system and can be used to analyze complex hydraulic conditions, such as surcharge and backwater, that may be encountered during an extreme storm event. The Cost Module can be used to estimate construction, operation and maintenance, and total annual costs associated with the drainage system. Two significant modifications to the Storm Water Management Model (SWMM) are the inclusion of the simulation of inlet hydraulics and the addition of kinematic cascades for overland flow. (Moore-SRC)

AIR-WATER FLOW IN HYDRAULIC STRUCTURES,
Water and Power Resources Service, Denver, CO. Engineering and Research Center.
H. T. Falvey.
Engineering Monograph 41, December, 1980. 155 p, 56 Fig, 74 Ref, 3 Append.

Descriptors: *Air demand, *Air entrainment, *Hydraulic structures, *Design criteria, Air-water interfaces, Hydraulic design, Open channel flow, Closed conduit flow, Free surfaces, Model studies, Computer programs, Jets, Pipelines, Intakes, Falling water surface.

The purpose of this report is to summarize the work that has been completed on air-entrainment and air-demand in both open channel and closed-conduit flows. The intent was to produce a concise reference source from which manuals, monographs, and charts for specific applications could be prepared. Methods have been developed to predict the mean air concentration and concentration distribution with open channel flow. A new description of the free water surface in high velocity flow is proposed which more accurately represents actual conditions in high velocity flow. The effect of air entrainment on the performance of a stilling basin can be estimated using a bulked flow concept. A computer program is presented with which the mean air concentration in steep chutes and spillways can be estimated. With exception of a falling-water surface and decreasing flow in pipelines, closed conduit flows require model studies. When properly conducted and analyzed, model studies will yield accurate data for estimating airflow rates. Experimental methods are discussed. A computer program is presented which can be used to predict the airflow rate with a falling-water surface. Design charts are presented for sizing air relief valves and vacuum valves on pipelines. The airflow rate in vertical shafts was found to be extremely dependent upon the flow conditions at the shaft inlet. Equations are included for estimating the airflow rate having various inlet conditions. Factors influencing the airflow rate around free falling jets are discussed. This area is identified as one needing additional research. Equations are presented from which the air entraining characteristics of a jet entering a pool can be estimated. (Moore-SRC)

SOIL CONDITIONS DICTATE DESIGN OF LAKE WEIR,
Oakland County Drain Commissioner's Office, Pontiac, MI.
G. Yrjanainen.
Public Works, Vol 112, No 1, p 59, January, 1981.

Descriptors: *Dams, *Weirs, *Soil types, *Whitehorse Lake(MI), Michigan, Engineering structures, Marl, Sand, Lakes.

A make-shift, deteriorating dam at Whitehorse Lake, Michigan, was replaced with a sheet pile structure after soil borings showed a stable sand base. The work was done in 10 working days at a cost of $23,850. Sixty square yards of gabion mattress was installed on the downstream side of the weir. The top was protected and smoothed by a welded steel channel. Stone rip-rap stabilized the shoreline. (Cassar-FRC)
W81-01994

WATER AND POWER RESOURCES SERVICE PROJECT DATA.
Water and Power Resources Service, Denver, CO. Engineering and Research Center.
Water Resources Technical Publication, 1981. 1472 p, 8 Tab.

Descriptors: *Engineering structures, *Reservoirs, *Hydroelectric plants, *Conveyance structures, *Dams, Water control, Water distribution(Applied), Irrigation water, Storage, Recreation, Domestic water, Industrial water, Costs, Pumping plants, Canals, Construction, *Projects review.

Water and Power Resources Service projects, substantially complete and in operation, are reviewed in detail with considerable attention to history, costs, beneficiaries, engineering, and productivity. Newer projects in the early stages of construction, and projects which are authorized but not yet started, are treated briefly. Altogether, 135 projects are described. As of 1978, storage and distribution facilities had been constructed to serve 11.4 million acres of land with irrigation water. Crops harvested on farms receiving water from the Service in 1978 were valued at $4,993 million. Municipal and industrial water, 524,000 million gallons of it from Service projects, was delivered to areas populated by 16.6 million people. The 50 hydroelectric powerplants operating in 1978 had an installed capacity of 10.4 million kilowatts, and uprating units at existing facilities over 5 years will provide an additional 1 million kilowatt capacity. The hydroelectric energy totaling 40.6 billion kilowatt-hours generated in 1978 was sufficient to supply the residential needs of over 14 million people. There were 281 recreation areas, including reservoirs and other facilities on Service projects at the end of 1978. Recreational use of these areas increased during 1978 to a new record of 69.9 million visitor days. (Moore-SRC)
W81-02011

PIPELINE SOLVES FAR WEST RAND MINES WATER PROBLEM.
South African Mining and Engineering Journal, Vol 90, No 4150, p 96-97, May, 1979. 5 Fig.

Descriptors: *South Africa, *Pipelines, *Mine water, *Mine drainage, Flood protection, Hydraulic gradient, Corrosion control, Steel pipes, Welded joints, Steel structures, Subsurface drainage, Water transfer.

Gold Fields of South Africa has installed a 28 km pipeline at a cost of R4,500,000 to transport water from the Gemsbokfontein Compartment area to the West Driefontein canal in the Wonderfontein Valley. The pipeline is designed to accept and contain free flowing surface water and prevent it from entering into the mines beneath such as the West and East Driefontein. The pipeline will provide ground stability and safety as well as reducing the need for underground pumping. All portions of the pipeline are below the mean hydraulic gradient. The pipeline is composed of 9 m steel lengths alternately welded or connected by a loose sleeve coupling. Supports are located every 9 m. The project was completed in only four months and water flowed on December 5, 1977. The pipes are lined with Copon E 2300 for corrosion protection. Concor Construction was the major contractor. Since commissioning, flooding has caused some damage that has been repaired. (Seigler-IPA)

LESSONS FROM THE BAFOKENG DISASTER,
Department of Water Affairs, Pretoria (South Africa).
R. T. Rudd.
The Civil Engineer in South Africa, Vol 21, No 6, p 155-156, June, 1979.

Descriptors: *South Africa, *Bafokeng, *Slimes dams, *Mining engineering, *Dam failure, Dam designs, Dam foundations, Environmental effects, Pollution abatement, Design criteria, Water pollution, Overflow, Operation and maintenance, Erosion.

The failure of the slimes dam at Bafokeng has raised concern about the current methods of design, construction, operation and maintenance, and closure measures used for such structures. The Bafokeng dam was designed to provide a 'backstop' for pollution leaving the mine and to provide a water supply. It was located on a poor site with a long crest and was constructed of local materials such as rock, dunite, and slag from the sulfuric plant, rather than concrete. The failure of this dam shows that techniques suitable for one type of mining pollution control cannot simply be applied to all mining slimes dams. Topics of consideration for dam design and construction must include materials, mineral composition, pollution potential, geology, topography, climate, and hydro-meterology. Dam design should consider the importance of siting of a slimes dam and the impact to the environment in the event of failure. After construction, operation rules must be developed according to the design of the particular dam. Slimes dams must not be used to store water required for use or re-circulation. The failure of the Bafokeng dam appears to warrent a review of the current regulations regarding design freeboard and the associated design storms. (Seigler-IPA)

THE BAFOKENG DISASTER AND ITS LEGAL IMPLICATIONS,
Department of Water Affairs, Pretoria (South Africa).
R. T. Rudd.
The Civil Engineer in South Africa, Vol 21, No 6, p 146-150, June, 1979. 2 Tab, 2 Append.

Descriptors: *South Africa, *Bafokeng, *Slimes dams, *Legal aspects, *Dam failure, Dam designs, Environmental effects, Design criteria, Water pollution, Overflow, Operation and maintenance, Regulation, Mining engineering, Waste disposal.

Following the failure of the Bafokeng slimes dam in November 1974, mine authorities proposed remedial actions in compliance with South Africa's Water Act No. 54. Prior to the failure, the dam contained more than 13 million cu m of platinum slimes that were produced at the Bafokeng South Mine. All surface installations in the path of the slimes flow were destroyed and 12 men were killed when the slimes entered a shaft. Public streams

were polluted and a minor fish kill was reported at the Vaalkop Dam. Recommendations of short-, medium-, and long-term steps to assure the safety of the Vaalkop Dam waters included the construction of overspill rock barrier dams to prevent further runoff during the rainy season and settling basins to stop the spread of the slimes further down the valley. As a long-term action, the construction of safe, environmentally acceptable slimes and tailing dams should be reviewed. The Secretary of Water Affairs requested that all the facts relating to the Bafokeng disaster be released for the benefit of other mining authorities. Regulations pertaining to this disaster are reviewed including regional standards for industrial effluents in terms of chemical and physical parameters, waste water quality standards, safety aspects relating to materials poisonous to humans and animals, and management and design criteria concerning slimes dams that are regulated by the Water Act. (Seigler-IPA)

CAPE TOWN WATER AUGMENTATION SCHEME.
Municipal Engineer (Johannesburg), Vol 10, No 3, p 57-67, May/June, 1979. 16 Fig.

Descriptors: *South Africa, *Cape Town, *Water supply, *Water supply development, Dams, Pipelines, Aqueducts, Tunnels, Water conveyance, Pipes, Pumped storage, Concrete construction, Concrete pipes, Construction.

A 35 km aqueduct system is being constructed to deliver water from the Theewaterskloof and Assegaaibos Dams to pipelines in the Eerste and Berg River Valleys in South Africa. The system will give additional water supplies to the rapidly growing areas of Cape Town, Banta, and Mitchells Plain. The system, the Riviersonderend-Berg-Eerste River water scheme is expected to yield 83,000 MI/year. It is a joint effort by the City Council of Cape Town and the Government's Department of Water Affairs. Construction began in mid-1971 with the building of a 12 km aqueduct through the Franschhoek Mountains from the Theewaterskloof Dam to the Upper Berg River. Six other tunnels are being constructed with the entire system scheduled for completion in early 1981. With the construction of the aqueducts and dams, the final all-in cost of the project will amount to R110 million. An R23 million contract was awarded in 1976 to Southern Pipeline Contracts for the construction of the pipeline schemes. This system should provide adequate water supplies up to 1986 when additional supplies will probably be needed from the Palmiet River. (Seigler-IPA)
W81-02060

HYDROLOGICAL ASPECTS AND A BARRIER TO FURTHER ESCAPE OF SLIMES,
D. C. Midgley.
The Civil Engineer in South Africa, Vol 21, No 6, p 151-154, June, 1979. 5 Fig, 3 Tab, 5 Ref.

Descriptors: *South Africa, *Bafokeng, *Slimes dams, *Dam failure, *Hydrologic aspects, Design criteria, Mining, Water pollution, Rockfill dams, Design flood, Impoundments, Dam construction.

On November 11, 1974, the slimes dam at the Bafokeng Mine in South Africa failed following a rainfall of 75 mm in a 2 hour period. Evidence pieced together from eyewitness accounts and from photographs indicates that the dam was not overtopped. The most likely mechanism of failure was piping. To prevent further escape of slimes to the environment, a catchment dam was constructed in the local drainage to act as a settling basin. The catchment dam has a height of 6 m and, if empty, can arrest the total runoff from a single storm of 100-year return. The dam, with a crest length of 535 m, is the largest rockfilled dam in South Africa. The dam was completed in March of 1975 and, despite some repairs and additions, it has been quite successful. It is now used as a balancing reservoir for recirculated water and for water supply augmentation. Another plus is the abundant bird-life that has been attracted by the impoundment. (Seigler-IPA)

LINKSFIELD RESERVOIR: JOHANNESBURG.
Municipal Engineer (Johannesburg), Vol 10, No 3, p 15, 17-19, 21, May/June, 1979. 11 Fig.

Descriptors: *South Africa, *Linksfield Ridge, *Underground storage, Reservoirs, *Reservoir construction, Environmental effects, Archaeology, Vegetation regrowth, Revegetation, Vegetation establishment, Water storage, Vegetation effects, Planting management, Excavation, *Johannesburg.

Extensive preconstruction research was conducted to minimize the environmental effects of the new underground reservoir located in the Linksfield Ridge in the north-east sector of Johannesburg, South Africa. The reservoir will have a minimum capacity of 32 MI which will provide 24 hours of storage at peak summer demand in 1980. The reservoir site was investigated by an archeological team in 1977. Several sites were located including a prehistoric settlement of 12 stone structures, sites from the Iron Age, and sites from the Stone Age. These sites are being excavated and some of them will be reconstructed after the reservoir is completed. The reservoir will have a 5.5 m high cantilever wall with sloping floors for a maximum water depth of 8.69 m. A matrix analysis developed to minimize construction impacts recommended that the working area for the reservoir should be minimized, a cableway should be used for traffic movement, and the construction camp should be fragmented. After construction the reservoir will be covered with earth and revegetated. Spoil from the excavation will be used to build up a boggy area at Gilooly's Farm and to improve an area of Fotheringham Park. (Seigler-IPA)

MODELING RESERVOIR SYSTEM WITH PUMPED STORAGE,
Army Engineer District, Savannah, GA.
G. F. McMahon, V. R. Bonner, and B. S. Eichert.
Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers, Vol 106, No WR1, p 239-254, March, 1980. 3 Fig, 4 Tab, 13 Ref.

Descriptors: *Dams, *Simulation analysis, *Pumped storage, *Reservoir operation, *Savannah River, Georgia, Model studies, Reservoirs, Storage, Reservoir storage, Pump turbines, Recreation, Multiple-purpose projects, Operations, Power system operation, Hydroelectric plants, Water supply, Water storage, Water level fluctuations, Fluctuations.

A simulation study was performed on the Savannah River, Georgia, reservoir system, which includes 3 tandem dams--Hartwell, Russell (under construction), and Clark Hill. The purpose of the study was to determine the feasibility of installing pump turbines at Russell and predict the effects of pumped storage on recreational, environmental, hydropower, water supply and economic impacts of the 3 dams. Results yielded information useful for future operation of the system and for future water supply studies. Pumped storage would provide greater flexibility in meeting system requirements, and the ratio of primary energy shortage to system demand was 10% smaller than for system operation without pumped storage. System operation proved more efficient than operation for at-site requirements. This resulted in less pumping energy, reduced pool fluctuations, and a better balance of reservoir storage levels. SEDIMENT SUSPENSION IN TURBULENT PIPE FLOW,
Bechtel, Inc., San Francisco, CA.
S. T. Hsu, A. van der Beken, L. Landweber, and J. F. Kennedy.
Journal of the Hydraulics Division, Proceedings of the American Society of Civil Engineers, Vol 106, No HY11, p 1783-1793, November, 1980. 3 Fig, 1 Tab, 11 Ref.

Descriptors: *Pipe flow, *Sediments, *Turbulent flow, Hydraulics, Suspended load, Pipes, Flow, Turbulence, Diffusion, Eddies, Velocity, Shear, Friction, Particle size.

A theoretical diffusion model for sediment suspension in turbulent pipe flow is described, and results of experiments to verify the analysis are presented. The model employs a coordinate system. Flow and suspension are treated as uniform along the pipe, and the model is limited to sediment concentrations that are small enough to preserve the axisymmetric distribution of flow properties such as shear stress, diffusivity, and streamwise velocity. For each experiment a fixed quantity of sand was placed in a pipe loop apparatus, and discharge was controlled while velocity profiles were measured across the vertical and horizontal diameters of the discharge. It was found that the velocity distributions were axisymmetric across a central core extending over 85 - 90% of any diameter. Comparisons with data from the literature suggest that the constant values of turbulent diffusivities for momentum and suspended sediment in pipe flow differ, but not widely. Excellent agreement was obtained between experimental results and the theoretical model. The model has the potential to be modified for large concentrations. (Titus-FRC)

GENERAL ALGORITHM FOR ROUGH CONDUIT RESISTANCE,
Wade, Trim and Associates, Taylor, MI.
S. Kumar, and J. A. Roberson.
Journal of the Hydraulics Division, Proceedings of the American Society of Civil Engineers, Vol 106, No HY11, p 1745-1764, November, 1980. 14 Fig, 3 Tab, 23 Ref.

Descriptors: *Algorithms, *Hydraulic roughness, *Flow resistance, Hydraulics, Shear, Flow, Mathematical studies, Roughness coefficient, Channels, Physical properties, *Conduits, Pipes, Friction, Drag, Boundary processes.

A general algorithm for rough conduit resistance is presented, and relevant literature and field applications are discussed. The new contributions of the algorithm include development of a method for utilizing surface roughness profiles for resistance analysis, improved definition of fully rough conduits, and charts to determine flow resistance based on the geometry of the roughness elements. The algorithm addresses shear stress and velocity distribution for varying roughness conditions. Test measurements of resistance were made for iron pipes and natural streams. Test findings that the friction factor may become almost constant for both a fully rough and a semi-rough boundary under certain conditions were corroborated by the analytical results. Application of the algorithm to the strip type of roughness has not yielded satisfactory results. Some error is introduced to the algorithm because the size of the elements is not limited. In addition, the effect of local wake from upstream elements is not addressed, and conditions of very small roughness, in which a viscous sublayer could affect resistance, are not addressed. (Titus-FRC)

A FIRST IN SOUTH AFRICA: THE STEENBRAS PUMPED STORAGE SCHEME.
Imesa (Johannesburg), Vol 4, No 5, p 14-17, 19, 23, 25, May, 1979. 19 Fig.

Descriptors: *South Africa, *Pumped storage, *Steenbras reservoir scheme, *Hydroelectric

plants, *Reservoir storage, Electric power, Turbines, Penstocks, Intakes, Tunnels, Costs, Surge tanks, Economic prediction, Water supply, *Cape Town.

The upper reservoir of the Steenbras reservoir scheme will supply water for hydro-electric generation and will act as a reserve storage area for Cape Town, South Africa's water supply. The scheme has been developed jointly by the City Council and by Escom, the area's electric utility. The scheme is designed to minimize the City's overall cost of electricity by reducing its on-peak dependency on the utility. Water is pumped from the lower reservoir to the upper reservoir at night, an off-peak period with cheaper electric rates. This water is then released during on-peak periods to generate power. Extensive care was taken during the civil engineering to blend the works with the environment while maintaining economic optimization. The major components of the scheme include the upper reservoir, the upper intake works, the access adit, the low pressure tunnel, a surge shaft and tank, the high pressure shaft and tunnel, a steel penstock, the power station, and the lower control works and reservoir. Final project costs are estimated at R65 million or R360 per kilowatt. Within 10 years the cumulative discounted monetary savings are expected to be about R7 million. (Seigler-IPA)

8D. Soil Mechanics

RAISING STETTYNSKLOOF DAM.
The Civil Engineer in South Africa, Vol 21, No 9, p 223-227, September, 1979. 1 Fig.

Descriptors: *South Africa, *Stettynskloof Dam, *Dam construction, *Rock fill dams, Construction materials, Reservoirs, Water supply, Dam design, Damsites, Earthworks, Impoundments, Spillways, Water storage.

To raise its existing Stettynskloof concrete dam, the South African municipality of Worchester is constructing a composite earth and rockfill dam downstream of and abutting the concrete dam. The existing concrete dam was built in 1954 and holds 5 million cu m of water with its height of 30 m. The new composite dam will have a height of 48 m above the river bed level and will increase the reservoir capacity to 15 million cu m. This increase should be adequate to supply the area past the year 2000. Approximately half of the material for the new dam will be rockfill excavated from the riverbed downstream of the dam. Clay will be used for an impervious core zone. Earthfill materials will be taken from a borrow area in the reservoir basin. An R2.68 million contract was let in 1978 to Savage and Lovemoore Ltd with construction scheduled for completion in 1980. Construction equipment being used includes Caterpillar 769 dumptrucks, a Caterpillar 235 excavator, a Komatsu 085A bulldozer, and a 10 t Dynapac smooth drum and padfoot rollers. (Seigler-IPA)

STEENBRAS RESERVOIR: TROUT PLANTINGS AND RECOVERIES,
A. C. Harrison.
Piscator (Cape Town), Vol 32, No 104, p 111-115, Summer, 1979. 5 Tab, 1 Fig.

Descriptors: *South Africa, *Steenbras Reservoir, *Trout, *Fish stocking, Brook trout, Brown trout, Rainbow trout, Tiger trout, Smallmouth bass, Reservoirs, Fish establishment, Fish populations, Fry, Fish management, Fish reproduction.

Since its completion in 1920 the Steenbras Reservoir, which supplies water to Cape Town, South Africa, has been stocked with brown trout, tiger trout, rainbow trout, and brook trout. The Steenbras Reservoir has acid, peat-stained water which causes problems for trout. Although the trout introduced into the Reservoir have survived and grown, there has been no breeding. Smallmouth bass introduced in 1939 and 1940 have breed prolifically. Of the 76,040 brown trout stocked between 1952 and 1968, only 1,190 or 1.5% were caught and recorded. Scale-readings were used to determine age and to match a fish to its stocking group. Of 5,210 tiger trout, a hybrid brown trout and American Eastern brook trout, released from 1960 to 1967, only 197 or 4% were recovered. Between 1952 and 1954, 21,000 rainbow trout were released, but only 22 recoveries were recorded. Some rainbow trout were reported to have gone over the spillway of the dam. Since 1951, brook trout have also been stocked in the Reservoir, but they are difficult to identify. (Seigler-IPA)

EFFECTS OF STREAM HABITAT IMPROVEMENTS ON INVERTEBRATES, TROUT POPULATIONS, AND MINK ACTIVITY,
Macdonald Coll., Ste. Anne de Bellevue (Quebec). Dept. of Renewable Resources.
S. A. Burgess, and J. R. Bider.
Journal of Wildlife Management, Vol 44, No 4, p 871-880, October, 1980. 2 Fig, 2 Tab, 23 Ref.

Descriptors: *Habitat improvement, *Stream improvement, *Invertebrates, *Environmental effects, Brook trout, Crayfish, Mink, Freshwater fish, Fish management, Aquatic habitats, Wildlife management, Wildlife habitats, Aquatic animals, Small animals(Mammals), Lac Carre, *Quebec.

A section of spring-fed mountain stream near Lac Carre, Quebec, was altered to provide improved habitat for brook trout. A similar 100 meter section of stream was left unimproved as a control. Changes included adding small dams of rocks and logs, large boulders, and cover. After 2 years the trout population and biomass in the improved stream increased by 208% and 179%, respectively; crayfish, by 220%. In the improved section, water temperatures were the same as in the control; insect populations were higher. Mink were 52.5% more active near the improved stream, but preyed mostly on crayfish and small mammals. Analysis of mink scats showed that trout were not an important prey. (Cassar-FRC)

Design of Aeration Towers to Strip Volatile Contaminants from Drinking Water,
W81-02071 5F

Odor Control of Waste Water Treatment Plants,
W81-02105 5D

AEROBIC TREATMENT
Water Quality Conversion Matrix of Aerobic Biological Processes,
W81-02096 5D

AESTHETICS
General Provisions/Freedoms; Water Quality Standards; Criteria Summaries; A Compilation of State/Federal Criteria.
W81-02018 5G

AFRICA
Feeding in Zooplankton,
W81-02058 5C

AGRICULTURAL RUNOFF
Pesticides; Water Quality Standards; Criteria Summaries; A Compilation of State/Federal Criteria.
W81-02020 5G

AGRICULTURAL WATERSHEDS
Sediment Losses from Small Agricultural Watersheds in Hawaii (1972-77),
W81-01943 4D

AIR DEMAND
Air-Water Flow in Hydraulic Structures,
W81-01936 8A

AIR ENTRAINMENT
Air-Water Flow in Hydraulic Structures,
W81-01936 8A

ALABAMA
Hydrology of Selected Basins in the Warrior Coal Field, Alabama--A Progress Report,
W81-02038 6A

ALASKA
Hydrology of the Seldovia Area, Alaska,
W81-02037 2F

ALGAE
Epipelic Algal Communities in a Eutrophic Northern Lake Contaminated with Mine Wastes,
W81-01982 5C

Microcosm System Study of Algal Bloom Formation,
W81-02095 5C

ALGORITHMS
General Algorithm for Rough Conduit Resistance,
W81-02078 8B

ALKALINITY
Prediction of Alkalinity Changes in the Activated Sludge Process,
W81-02089 5D

ALLUVIAL AQUIFERS
Digital Model of the Bayou Bartholomew Alluvial Aquifer-Stream System, Arkansas,
W81-02044 6A

ALTERNATIVE PLANNING
Fairness Considerations and Alternative Policies,
W81-02125 6A

AMINO ACIDS
Gas-Chromatographic/Mass-Spectrometric Analysis of Derivatized Amino Acids in Municipal Waste Water Products,
W81-02128 5A

AMMONIA
Some Factors Affecting the Toxicity of Ammonia to Fishes,
W81-01915 5C

AMMONIA VOLATILIZATION
Volatilization, Plant Uptake and Mineralization of Nitrogen in Soils Treated With Sewage Sludge,
W81-02009 5D

ANAEROBIC DIGESTION
Determination of Hydrolytic Activities in Waste Water Systems by Microcalorimetry,
W81-01984 5D

Trace Metals and Anaerobic Digestion of Leachate,
W81-02094 5D

AQUA FRIA RIVER (AZ)
Flood of February 1980 Along the Agua Fria River, Maricopa County, Arizona,
W81-02027 2E

AQUATIC ALGAE
Feeding in Zooplankton,
W81-02058 5C

AQUATIC ENVIRONMENT
A Research Strategy for Anticipating Contaminant Threats to Aquatic Resources,
W81-01906 5C

Theoretical Aspects of the 'Normalcy and Pathology' Problem in Aquatic Ecotoxicology,
W81-01908 5C

Trends in Aquatic Toxicology in the United States: A Perspective,
W81-01909 5C

Element Flow in Aquatic Systems Surrounding Coal-Fired Plants; Wisconsin Power Plant Impact Study,
W81-01934 5B

Responses of Submersed Vascular Plant Communities to Environmental Change,
W81-02013 5C

AQUATIC INSECTS
The Control of Animals in Water Mains Using Permethrin, A Synthetic Pyrethroid,
W81-01905 5F

AQUATIC LIFE
Principles of Estimation of Normal and Pathologic States of Reservoirs with Chemical Pollution,
W81-01907 5C

Theoretical Aspects of the 'Normalcy and Pathology' Problem in Aquatic Ecotoxicology,
W81-01908 5C

Comparison of Principles of Development and Use of Water Quality Standards in the USSR and USA,
W81-01910 5C

Effect of Industrial Pollution on the Kalu River Ecosystem,
W81-02145 5C

AQUATIC PLANTS
Responses of Submersed Vascular Plant Communities to Environmental Change,
W81-02013 5C

AQUATIC POPULATIONS
Changes in the Density of Zooplankton Passing through the Cooling System of a Power-Generating Plant,
W81-01986 5C

AQUIFER CHARACTERISTICS
Instability in Aquifer Identification: Theory and Case Studies,
W81-01972 2F

Maps Showing Groundwater Conditions in the Hassayampa Area, Maricopa and Yavapai Counties, Arizona--1978,
W81-02028 7C

AQUIFERS
Theoretical Head Variograms for Steady Flow in Statistically Homogeneous Aquifers,
W81-01973 2F

Analytical Study of the Ogallala Aquifer in Sherman County, Texas, Projections of Saturated Thickness, Volume of Water in Storage, Pumpage Rates, Pumping Lifts, and Well Yields,
W81-02000 4B

Analytical Study of the Ogallala Aquifer in Moore County, Texas, Projections of Saturated Thickness, Volume of Water in Storage, Pumpage Rates, Pumping Lifts, and Well Yields,
W81-02001 4B

Analytical Study of the Ogallala Aquifer in Armstrong County, Texas, Projections of Saturated Thickness, Volume of Water in Storage, Pumpage Rates, Pumping Lifts, and Well Yields,
W81-02002 4B

Occurrence and Quality of Groundwater in the Edwards-Trinity (Plateau) Aquifer in the Trans-Pecos Region of Texas,
W81-02003 4B

Records of Wells, Water Levels, Pumpage, and Chemical Analyses of Water from the Carrizo Aquifer in the Winter Garden Area, Texas, 1970 through 1977,
W81-02004 4B

Analytical Study of the Ogallala Aquifer in Randall County, Texas, Projections of Saturated Thickness, Volume of Water in Storage, Pumpage Rates, Pumping Lifts, and Well Yields,
W81-02005 4B

Analytical Study of the Ogallala Aquifer in Swisher County, Texas, Projections of Saturated Thickness, Volume of Water in Storage, Pumpage Rates, Pumping Lifts, and Well Yields,
W81-02006 4B

Groundwater Hydrology of the Sagebrush Flat Area and Possible Relations to the Discharge of Rattlesnake Springs, Grant and Douglas Counties, Washington,
W81-02032 2F

ARIZONA
Model of Time and Space Distribution of Rainfall in Arizona and New Mexico,
W81-01939 2B

ARIZONA

Flood of February 1980 Along the Agua Fria River, Maricopa County, Arizona.
W81-02027 2E

Maps Showing Groundwater Conditions in the Hassayampa Area, Maricopa and Yavapai Counties, Arizona--1978.
W81-02028 7C

ARKANSAS
Digital Model of the Bayou Bartholomew Alluvial Aquifer-Stream System, Arkansas.
W81-02044 6A

ARMSTRONG COUNTY (TX)
Analytical Study of the Ogallala Aquifer in Armstrong County, Texas, Projections of Saturated Thickness, Volume of Water in Storage, Pumpage Rates, Pumping Lifts, and Well Yields.
W81-02002 4B

AROMATIC-COMPOUNDS
Organics; Water Quality Standards; Criteria Summaries; A Compilation of State/Federal Criteria.
W81-02016 5G

ARSENIC
Removal of Arsenic from Contaminted Drinking Water by a Chitosan/Chitin Mixture.
W81-01988 5F

ARTIFICIAL RECHARGE
Behaviour of Nitrilotriacetic Acid during Groundwater Recharge.
W81-01981 5B

ASPHALTIC CONCRETE
The Asphaltic Concrete Lining of a Reservoir in the Eastern Transvaal.
W81-01902 8A

AUSTRALIA
A Cost-Benefit Analysis of Water Use Restrictions.
W81-01952 3D

Heavy Metals and Marine Diatoms: Influence of Dissolved Organic Compounds on Toxicity and Selection for Metal Tolerance among Four Species.
W81-01978 5C

AUTOMATIC CONTROL
Digital On-Line Closed-Loop Control for Waste Water Treatment Operation.
W81-02090 5D

AVAILABLE WATER
Water-Supply Assessment of the Laramie-Fox Hills Aquifer in Parts of Adams, Boulder, Jefferson, and Weld Counties, Colorado.
W81-02033 4B

BACTERIA
Some Considerations on the Dense Population of a Purple Sulfur Bacterium, Chromatium Sp. at the Mid-Depth of Lake Kaiike.
W81-01977 2H

A Preliminary Analysis of Bacterial Numbers and Biomass in Langebaan Lagoon.
W81-02055 5A

Reservoir Coatings Can Support Bacterial Growth.
W81-02072 5F

BAFFLES
Notes and Comments: The Problem With Perforated Baffles.
W81-02069 5F

BAFOKENG
Lessons from the Bafokeng Disaster.
W81-02056 8A

The Bafokeng Disaster and Its Legal Implications.
W81-02057 8A

Hydrological Aspects and a Barrier to Further Escape of Slimes.
W81-02061 8A

BAKER BAY
Mathematical Modeling of Circulation in Baker Bay, Washington/Oregon.
W81-02010 2L

BASELINE STUDIES
Study of Littoral Currents in Costa Del Sol in Relation to the Placement of Submarine Outfalls Envisioned in the Comprehensive Treatment Plan. (Estudio De Corrientes Litorales En La Costa Del Sol, En Relacion Con Los Emplazamientos De Emisarios Submarinos Previstos En El Proyecto De Saneamiento Integral).
W81-01975 6A

Hydrology of Selected Basins in the Warrior Coal Field, Alabama--A Progress Report.
W81-02038 6A

Baseline Water Quality of Schmidt, Hornbeam, and Horseshoe Lakes, Dakota County, Minnesota.
W81-02039 6A

BAYOU BARTHOLOMEW
Digital Model of the Bayou Bartholomew Alluvial Aquifer-Stream System, Arkansas.
W81-02044 6A

BAYS
Mathematical Modeling of Circulation in Baker Bay, Washington/Oregon.
W81-02010 2L

BENTHIC FAUNA
Eutrophication in Emilia-Romagna Coastal Waters (North Adriatic Sea, Italy): A Case History.
W81-02086 5C

Effect of Construction and Use of a Harbor-Industrial Complex on the Distribution and Evolution of the Benthic Population of a Mediterranean Gulf (Gulf of Fos). (Influence De La Construction Et L'Exploitation D'Un Complexe Portuaire Et Industriel Sur La Distribution Et L'Evolution Des Peuplements Benthiques Littorauz D'Un Golfe Mediterraneen (Golfe De Fos)).
W81-02130 5C

BENTHOS
Aspects of the Interaction Between Benthos and Sediments in the North American Great Lakes and Effects of Toxicant Exposures.
W81-01920 5C

BIOCHEMISTRY
Cilio-Inhibitory Effects of Bronchial Nerve Stimulation, Dopamine, Pentylenetetrazole and Visible Light in the Mussel, Mytilus Edulis.
W81-01947 5C

BIOCONTROL
Ionophore-Mediated Calcium Control of Ciliary Arrest in the Fingernail Clam, Musculium Transversum.
W81-01945 5C

BIODEGRADATION
Determination of Hydrolytic Activities in Waste Water Systems by Microcalorimetry.
W81-01984 5D

BIOINDICATORS
Relationship of Viruses and Indicator Bacteria in Water and Waste Water of Israel.
W81-02133 5A

BIOLOGICAL OXYGEN DEMAND
Cost-Efficiency of Transferable Discharge Permits for the Control of BOD Discharges.
W81-01967 6C

Use of Equivalent BOD as a New Waste Management Tool.
W81-02088 5A

BIOLOGICAL TREATMENT
Water Quality Conversion Matrix of Aerobic Biological Processes.
W81-02096 5D

Phenol and Free Ammonia Inhibition to Nitrosomonas Activity.
W81-02138 5D

BIOMASS
A Preliminary Analysis of Bacterial Numbers and Biomass in Langebaan Lagoon.
W81-02055 5A

CALCIUM
Silicon Substitution for Calcium in the Shell of the Fingernail Clam, Musculium Transversum Studied by X-Ray Analysis.
W81-01904 5C

Ionophore-Mediated Calcium Control of Ciliary Arrest in the Fingernail Clam, Musculium Transversum.
W81-01945 5C

The Regulation of Intracellular Calcium and the Release of Neurotransmitters in the Mussel, Mytilus Edulis.
W81-01946 5C

Cilio-Inhibitory Effects of Bronchial Nerve Stimulation, Dopamine, Pentylenetetrazole and Visible Light in the Mussel, Mytilus Edulis.
W81-01947 5C

CALCIUM CARBONATE
Prediction of the Calcium Carbonate Saturation pH in Cooling Water.
W81-02135 5C

CALIFORNIA
Trap Efficiency Study, Highland Creek Flood Retarding Reservoir Near Kelseyville, California, Water Years 1966-77.
W81-02030 2J

CANOPY
Plant and Canopy Temperatures in Corn as Influenced by Differential Moisture Stress.
W81-01948 3F

CAPE TOWN
A First in South Africa: The Steenbras Pumped Storage Scheme.
W81-02051 8C

Cape Town Water Augmentation Scheme.
W81-02060 8A

CARBON
Sorption Capacities of Graphitized Carbon Black in Determination of Chlorinate Pesticide Traces in Water.
W81-02149 5A

CARBONATE ROCKS
Groundwater Availability in Carbonate Rocks of the Dandridge Area, Jefferson County, Tennessee.
W81-02034 2F

CARBONATES
Response of Lead Solubility to Dissolved Carbonate in Drinking Water.
W81-02070 5B

CARRIZO AQUIFER (TX)
Records of Wells, Water Levels, Pumpage, and Chemical Analyses of Water from the Carrizo Aquifer in the Winter Garden Area, Texas, 1970 through 1977,
W81-02004 4B

CHANNELING
Impact of Stream Alterations on Riparian Communities in Southcentral Oklahoma,
W81-02025 6G

CHELATION
Species of Dissolved Metals Derived from Oligotrophic Hard Water,
W81-01989 5A

CHEMICAL ANALYSIS
Records of Wells, Water Levels, Pumpage, and Chemical Analyses of Water from the Carrizo Aquifer in the Winter Garden Area, Texas, 1970 through 1977,
W81-02004 4B

CHEMICAL WASTES
Organic Compounds in an Industrial Waste Water. Their Transport into Sediments,
W81-02144 5B

CHLORINATION
Preventing Haloform Formation in Drinking Water,
W81-01933 5F

Design of Dechlorination Units for Power Plant Cooling Streams,
W81-02084 5D

Disinfection of Secondary Treated Effluent with Ozone. (Disinfection Des Eaux Residuaires Urbaines Par L'Ozone.),
W81-02116 5D

Volatile Halocarbon Production from the Chlorination of Marine Algal Byproducts Including D-Mannitol,
W81-02127 5B

Gas-Chromatographic/Mass-Spectrometric Analysis of Derivatized Amino Acids in Municipal Waste Water Products,
W81-02128 5A

Contribution of Marine Algae to Trihalomethane Production in Chlorinated Estuarine Water,
W81-02131 5B

Factors Influencing the Formation of Haloforms in the Chlorination of Humic Materials,
W81-02143 5B

CHLORINE
Development of the Facts Procedure for Combined Forms of Chlorine and Ozone in Aqueous Solutions,
W81-02142 5A

CHLOROPHYLL
Contribution of Marine Algae to Trihalomethane Production in Chlorinated Estuarine Water,
W81-02131 5B

CHROMATIUM SP
Some Considerations on the Dense Population of a Purple Sulfur Bacterium, Chromatium Sp. at the Mid-Depth of Lake Kaiike,
W81-01977 2H

CLAMS
X-Ray Analysis of Sediment Regions and Transport of Sediment Particular Material on the Gill of the Fingernail Clam, Musculium Transversum,
W81-01903 5C

Silicon Substitution for Calcium in the Shell of the Fingernail Clam, Musculium Transversum Studied by X-Ray Analysis,
W81-01904 5C

Ionophore-Mediated Calcium Control of Ciliary Arrest in the Fingernail Clam, Musculium Transversum,
W81-01945 5C

CLAYS
Benefits of Drainage and Irrigation a Claypan Soil,
W81-01944 3F

COAL MINING
Hydrology of Selected Basins in the Warrior Coal Field, Alabama--A Progress Report,
W81-02038 6A

COBB COUNTY (GA)
Minimizing Sludge Handling and Energy Requirements for Advanced Waste Water Treatment,
W81-02087 5D

COLORADO
Water-Supply Assessment of the Laramie-Fox Hills Aquifer in Parts of Adams, Boulder, Jefferson, and Weld Counties, Colorado,
W81-02033 4B

Elemental Partitioning in an Aboveground Oil Shale Retort Pilot Plant,
W81-02141 5B

COLORIMETRY
An Automated Method for the Determination of Non-Ionic Surfactants in Water,
W81-01987 5A

Development of the Facts Procedure for Combined Forms of Chlorine and Ozone in Aqueous Solutions,
W81-02142 5A

COMBINED SEWERS
Combined Sewer System Analysis Using Storm and SWMM for the City of Cornwall,
W81-01922 5D

Challenging Combined Sewer Problems in Japan,
W81-02103 4C

Mathematical Model for Improving Combined Sewer Systems,
W81-02104 4A

COMPACTION
Land-Surface Subsidence in the Texas Coastal Region,
W81-02031 2F

COMPREHENSIVE PLANNING
Comprehensive Basin-Wide Planning of Sewer Systems,
W81-02102 6A

COMPUTER MODELS
Groundwater Models for Water Resources Planning,
W81-02035 2F

Mathematical Model for Improving Combined Sewer Systems,
W81-02104 4A

COMPUTERS
Digital On-Line Closed-Loop Control for Waste Water Treatment Operation,
W81-02090 5D

CONDUITS
General Algorithm for Rough Conduit Resistance,
W81-02078 8B

CONJUNCTIVE USE
Drought Mitigation Strategy: Conjunctive Use in Smith Valley, Nevada,
W81-01997 6E

CONSTRUCTION
Effect of Construction and Use of a Harbor-Industrial Complex on the Distribution and Evolution of the Benthic Population of a Mediterranean Gulf (Gulf of Fos). (Influence De La Construction Et L'Exploitation D'Un Complexe Portuaire Et Industriel Sur La Distribution Et L'Evolution Des Peuplements Benthiques Littorauz D'Un Golfe Mediterraneen (Golfe De Fos)),
W81-02130 5C

CONTOUR FARMING
Soil Erosion by Water as Related to Management of Tillage and Surface Residues, Terracing, and Contouring in Eastern Oregon,
W81-01940 4D

CONTROL
Oxygen Uptake as a Control Parameter,
W81-02098 5D

CONTROLLED DRAINAGE
Detention Lake Application in Master Drainage Planning,
W81-01930 4A

Alternative Urban Flood Relief Measures; A Case Study; City of Regina, Saskatchewan, Canada,
W81-01931 4A

CONVEYANCE STRUCTURES
Water and Power Resources Service Project Data.
W81-02011 8A

COOLING WATER
Element Flow in Aquatic Systems Surrounding Coal-Fired Plants; Wisconsin Power Plant Impact Study,
W81-01934 5B

Changes in the Density of Zooplankton Passing through the Cooling System of a Power-Generating Plant,
W81-01986 5C

Design of Dechlorination Units for Power Plant Cooling Streams,
W81-02084 5D

Prediction of the Calcium Carbonate Saturation pH in Cooling Water,
W81-02135 5C

CORN (FIELD)
Benefits of Drainage and Irrigation a Claypan Soil,
W81-01944 3F

Plant and Canopy Temperatures in Corn as Influenced by Differential Moisture Stress,
W81-01948 3F

CORNWALL (ONTARIO)
Combined Sewer System Analysis Using Storm and SWMM for the City of Cornwall,
W81-01922 5D

COST-BENEFIT ANALYSIS
A Cost-Benefit Analysis of Water Use Restrictions,
W81-01952 3D

Package Water Treatment Plants, Volume 2. A Cost Evaluation,
W81-02015 5F

COST COMPARISONS
Cost-Efficiency of Transferable Discharge Permits for the Control of BOD Discharges.
W81-01967 6C

COSTA DEL SOL (SPAIN)
Study of Littoral Currents in Costa Del Sol in Relation to the Placement of Submarine Outfalls Envisioned in the Comprehensive Treatment Plan. (Estudio De Corrientes Litorales En La Costa Del Sol, En Relacion Con Los Emplazamientos De Emisarios Submarinos Previstos En El Proyecto De Saneamiento Integral).
W81-01975 6A

CRITICAL FLOW
Intermittent Streams; Water Quality Standards; Criteria Summaries; A Compilation of State/Federal Criteria.
W81-02017 5G

CROP RESPONSE
Benefits of Drainage and Irrigation a Claypan Soil.
W81-01944 3F

Plant and Canopy Temperatures in Corn as Influenced by Differential Moisture Stress.
W81-01948 3F

Volatilization, Plant Uptake and Mineralization of Nitrogen in Soils Treated With Sewage Sludge.
W81-02009 5D

CYANOPHYTA
Microcosm System Study of Algal Bloom Formation.
W81-02095 5C

CYCLING NUTRIENTS
Steady-State Oscillation of Uptake Kinetics by Microorganisms in Mesotrophic and Eutrophic Watermasses.
W81-02148 5C

DAIRY INDUSTRY
Use of Equivalent BOD as a New Waste Management Tool.
W81-02088 5A

DAKOTA COUNTY (MN)
Baseline Water Quality of Schmidt, Hornbeam, and Horseshoe Lakes, Dakota County, Minnesota.
W81-02039 6A

DAM CONSTRUCTION
Raising Stettynskloof Dam.
W81-02062 8D

DAM FAILURE
Lessons from the Bafokeng Disaster.
W81-02056 8A

The Bafokeng Disaster and Its Legal Implications.
W81-02057 8A

Hydrological Aspects and a Barrier to Further Escape of Slimes.
W81-02061 8A

DAMS
Soil Conditions Dictate Design of Lake Weir.
W81-01994 8A

Water and Power Resources Service Project Data.
W81-02011 8A

Modeling Reservoir System with Pumped Storage.
W81-02068 8A

DAPHNIA
The Prediction of the Effects of Pollutants on Aquatic Organisms Based on the Data of Acute Toxicity Experiments.
W81-01916 5C

DATA COLLECTIONS
A Long-Term Data Base for the Investigation of Urban Runoff Pollution.
W81-01932 5B

The Loading Concept as Basis for Controlling Eutrophication: Philosophy and Preliminary Results of the OECD Programme on Eutrophication.
W81-02121 5C

DDE
Chlorinated Hydrocarbons as a Limiting Factor in the Reproduction of Lake Trout in Lake Michigan.
W81-01911 5C

DDT
Accumulation and Metabolism of Persistent Pesticides in Freshwater Fish.
W81-01914 5C

DECHLORINATION
Design of Dechlorination Units for Power Plant Cooling Streams.
W81-02084 5D

DECISION MAKING
Energy Analysis for Environmental Impact Assessment.
W81-02120 6B

Fairness Considerations and Alternative Policies.
W81-02125 6A

DENITRIFICATION
Feasibility of On-Site Denitrification of Waste Water by Separation of Grey and Blackwater.
W81-01901 5D

DENVER
Digital On-Line Closed-Loop Control for Waste Water Treatment Operation.
W81-02090 5D

DEPTH-AREA-DURATION ANALYSIS
A Depth-Area-Duration Model of Storm Rainfall in the Southern Great Plains.
W81-01964 2B

DESALINATION
Desalination: A Practical Process.
W81-02053 3A

DESALINATION PROCESSES
Desalination: A Practical Process.
W81-02053 3A

DESIGN CRITERIA
Air-Water Flow in Hydraulic Structures.
W81-01936 8A

A Logical Approach to the Design Storm Concept.
W81-01971 6A

Recent Developments in Filtration System Design.
W81-02074 5F

Tannery Waste Water Treatment by the Oxygen Activated Sludge Process.
W81-02111 5D

DESIGN STORMS
Kinematic Design Storms Incorporating Spatial and Time Averaging.
W81-01928 2B

A Logical Approach to the Design Storm Concept.
W81-01971 6A

DETENTION RESERVOIRS
Trap Efficiency Study, Highland Creek Flood Retarding Reservoir Near Kelseyville, California, Water Years 1966-77.
W81-02030 2J

Detention Storage for Urban Flood Control.
W81-02117 2E

DETERGENTS
Behaviour of Nitrilotriacetic Acid during Groundwater Recharge.
W81-01981 5B

DEWATERING
Slimes Consolidation at the Henderson Mine.
W81-02014 5D

DIATOMS
Heavy Metals and Marine Diatoms: Influence of Dissolved Organic Compounds on Toxicity and Selection for Metal Tolerance among Four Species.
W81-01978 5C

DIEL MIGRATION
Tidal and Diel Fluctuations in the Temporal Concentrations of Chlorophyll A and Pheophytin at a Station Monitoring a High-Marsh Creek.
W81-02076 2L

DIFFUSION
Study of Littoral Currents in Costa Del Sol in Relation to the Placement of Submarine Outfalls Envisioned in the Comprehensive Treatment Plan. (Estudio De Corrientes Litorales En La Costa Del Sol, En Relacion Con Los Emplazamientos De Emisarios Submarinos Previstos En El Proyecto De Saneamiento Integral).
W81-01975 6A

Prediction of the Contamination Produced by Dispersion of Effluents through Ocean Outfalls. (Prediccion De Los Niveles De Contaminacion Producidos Por Vertidos Realizados a Traves De Emisarios Submarinos.).
W81-02129 5B

DIGITAL COMPUTERS
Digital On-Line Closed-Loop Control for Waste Water Treatment Operation.
W81-02090 5D

DISEASES
Waterborne Disease: Occurrence is on the Upswing.
W81-02075 5C

DISINFECTION
Inactivation of f2 Virus with Ferrate (VI).
W81-02137 5D

DISPERSION
The Application of E.E.C. Bathing Water Standards to the Design of Sea Outfalls.
W81-01958 5D

DISTILLATION
Desalination: A Practical Process.
W81-02053 3A

DISTRIBUTION PATTERNS
Spatial and Seasonal Precipitation Distribution in Southwest Idaho.
W81-01938 2B

DISTRIBUTION SYSTEMS
Preventing Haloform Formation in Drinking Water.
W81-01933 5F

DRAINAGE
Hydrologic Impact of Draining Small Depressional Watersheds.
W81-02080 2E

DRAINAGE PRACTICES
Benefits of Drainage and Irrigation a Claypan Soil,
W81-01944 3F

DRAINAGE SYSTEMS
Alternative Urban Flood Relief Measures: A Case Study; City of Regina, Saskatchewan, Canada,
W81-01931 4A

DROUGHTS
Drought Mitigation Strategy: Conjunctive Use in Smith Valley, Nevada,
W81-01997 6E

DURBAN
The Effect of Metering on Urban Water Consumption,
W81-02066 3D

Durban's Water Supply,
W81-02067 6D

DYE DISPERSION
Field Measurement of Transverse Diffusion in Undirectional Flow in a Wide, Straight Channel,
W81-02140 5B

ECOLOGY
Changes in the Density of Zooplankton Passing through the Cooling System of a Power-Generating Plant,
W81-01986 5C

ECOSYSTEMS
A Research Strategy for Anticipating Contaminant Threats to Aquatic Resources,
W81-01906 5C

Trends in Aquatic Toxicology in the United States: A Perspective,
W81-01909 5C

Comparison of Principles of Development and Use of Water Quality Standards in the USSR and USA,
W81-01910 5C

EFFLUENT LIMITATIONS
Distribution Methods for Transferable Discharge Permits,
W81-01960 5G

EFFLUENTS
Effluent Can Be Expensive.
W81-02045 5D

Elemental Partitioning in an Aboveground Oil Shale Retort Pilot Plant,
W81-02141 5B

EGYPT
Strategy for Irrigation Development in Egypt up to the Year 2000,
W81-01950 3F

EISEL'S EQUATION
Analysis of a Chance-Constrained Reservoir Control Model,
W81-01959 4A

ELECTRIC CURRENTS
The Regulation of Intracellular Calcium and the Release of Neurotransmitters in the Mussel, Mytilus Edulis,
W81-01946 5C

Cilio-Inhibitory Effects of Bronchial Nerve Stimulation, Dopamine, Pentylenetetrazole and Visible Light in the Mussel, Mytilus Edulis,
W81-01947 5C

ELECTRIC POWER INDUSTRY
Design of Dechlorination Units for Power Plant Cooling Streams,
W81-02084 5D

ELECTRIC POWERPLANTS
Changes in the Density of Zooplankton Passing through the Cooling System of a Power-Generating Plant,
W81-01986 5C

ELECTRODIALYSIS
Desalination: A Practical Process,
W81-02053 3A

ELEVATION
Spatial and Seasonal Precipitation Distribution in Southwest Idaho,
W81-01938 2B

ENERGY
Energy Criteria for Water use,
W81-02008 6B

Energy Analysis for Environmental Impact Assessment,
W81-02120 6B

ENERGY CONSERVATION
Energy and Water Conservation Research and the Local Authority,
W81-02047 3D

ENERGY SOURCES
Mill's Conversion of Solid Waste into Fuel Yields Energy Savings.
W81-01995 5E

ENGINEERING PERSONNEL
Energy and Water Conservation Research and the Local Authority,
W81-02047 3D

ENGINEERING STRUCTURES
Plant and Canopy Temperatures in Corn as Influenced by Differential Moisture Stress,
W81-01948 3F

Water and Power Resources Service Project Data.
W81-02011 8A

ENVIRONMENTAL EFFECTS
Impact of Stream Alterations on Riparian Communities in Southcentral Oklahoma,
W81-02025 6G

Mount St. Helens Ash Fall in the Bull Run Watershed, Oregon, May-June 1980,
W81-02036 5B

Effects of Stream Habitat Improvements on Invertebrates, Trout Populations, and Mink Activity,
W81-02091 8I

Energy Analysis for Environmental Impact Assessment,
W81-02120 6B

EPIDEMIOLOGY
Waterborne Disease: Occurrence is on the Upswing,
W81-02075 5C

EROSION
The Distribution of Kinetic Energy of Rainfall in South Africa - A First Assessment,
W81-01957 2B

EROSION CONTROL
Soil Erosion by Water as Related to Management of Tillage and Surface Residues, Terracing, and Contouring in Eastern Oregon,
W81-01940 4D

ESTUARIES
Mathematical Modeling of Circulation in Baker Bay, Washington/Oregon,
W81-02010 2L

Phosphorus; Water Quality Standards; Criteria Summaries; A Compilation of State/Federal Criteria.
W81-02024 5G

Water Quality in Rhode River at Smithsonian Institution Pier Near Annapolis, Maryland, January 1976 Through December 1978,
W81-02040 5A

Tidal and Diel Fluctuations in the Temporal Concentrations of Chlorophyll A and Pheophytin at a Station Monitoring a High-Marsh Creek,
W81-02076 2L

ESTUARINE ENVIRONMENT
Contribution of Marine Algae to Trihalomethane Production in Chlorinated Estuarine Water,
W81-02131 5B

EUTROPHIC LAKES
Epipelic Algal Communities in a Eutrophic Northern Lake Contaminated with Mine Wastes,
W81-01982 5C

EUTROPHICATION
Synergistic Effects of Phosphorus and Heavy Metal Loadings on Great Lakes Phytoplankton,
W81-01918 5C

Feeding in Zooplankton,
W81-02058 5C

Eutrophication in Emilia-Romagna Coastal Waters (North Adriatic Sea, Italy): A Case History,
W81-02086 5C

Microcosm System Study of Algal Bloom Formation,
W81-02095 5C

The Loading Concept as Basis for Controlling Eutrophication: Philosophy and Preliminary Results of the OECD Programme on Eutrophication,
W81-02121 5C

A Steady State Eutrophication Model for Lakes,
W81-02139 5C

Steady-State Oscillation of Uptake Kinetics by Microorganisms in Mesotrophic and Eutrophic Watermasses,
W81-02148 5C

EXCAVATION
Effect of Construction and Use of a Harbor-Industrial Complex on the Distribution and Evolution of the Benthic Population of a Mediterranean Gulf (Gulf of Fos). (Influence De La Construction Et L'Exploitation D'Un Complexe Portuaire Et Industriel Sur La Distribution Et L'Evolution Des Peuplements Benthiques Littorauz D'Un Golfe Mediterraneen (Golfe De Fos)),
W81-02130 5C

FACTS PROCEDURE
Development of the Facts Procedure for Combined Forms of Chlorine and Ozone in Aqueous Solutions,
W81-02142 5A

FAIRNESS
Fairness Considerations and Alternative Policies,
W81-02125 6A

FALLOUT
Concentrations of Radionuclides in Lake Ontario Water from Measurements on Water Treatment Plant Sludges,
W81-01985 5A

FEDERAL WATER POLLUTION CONTROL ACT
A Synopsis of Perspectives on the Innovative and Alternative Technology Program.
W81-02114 6E

FILTERS
Solid Liquid Separation by Filtration -- A Review.
W81-02048 5D

FILTRATION
New York City's Pilot Plant Filter Studies. Part Two.
W81-01993 5F

Solid Liquid Separation by Filtration -- A Review.
W81-02048 5D

Recent Developments in Filtration System Design.
W81-02074 5F

Filterbelt Pressing of Sludge--A Laboratory Simulation.
W81-02093 5D

FINANCING
Financing Waste Water Treatment in Japan.
W81-02101 6C

FISH
Monitoring Contaminant Residues in Freshwater Fishes in the United States: The National Pesticide Monitoring Program.
W81-01913 5C

Some Factors Affecting the Toxicity of Ammonia to Fishes.
W81-01915 5C

Age Specifics of Sensitivity and Resistance of Fish to Organic and Inorganic Poisons.
W81-01917 5C

Reversibility of Intoxication and Factors Governing It.
W81-01919 5C

Recent Advances in the Study of Nitrite Toxicity to Fishes.
W81-01921 5C

FISH MANAGEMENT
Reversibility of Intoxication and Factors Governing It.
W81-01919 5C

FISH REPRODUCTION
Chlorinated Hydrocarbons as a Limiting Factor in the Reproduction of Lake Trout in Lake Michigan.
W81-01911 5C

FISH STOCKING
Steenbras Reservoir: Trout Plantings and Recoveries.
W81-02052 8I

FLOOD CONTROL
Detention Storage for Urban Flood Control.
W81-02117 2E

Political Aspects of Urban Stormwater Management.
W81-02118 2E

FLOOD FREQUENCY
A Logical Approach to the Design Storm Concept.
W81-01971 6A

An Analysis of the Magnitude and Frequency of Floods on Oahu, Hawaii.
W81-02042 2E

FLOOD PLAINS
River Management in the Urban Environment.
W81-02050 4C

FLOODS
Flood of February 1980 Along the Agua Fria River, Maricopa County, Arizona.
W81-02027 2E

An Analysis of the Magnitude and Frequency of Floods on Oahu, Hawaii.
W81-02042 2E

FLORIDA
Water Resources Data for Florida, Water Year 1979--Volume 1. Northeast Florida.
W81-02029 7C

Hydrologic Data for Okaloosa, Walton, and Southeastern Santa Rosa Counties, Florida.
W81-02043 7C

FLOTATION
Lead Removal with Adsorbing Colloid Flotation.
W81-02085 5D

FLOW
Validity of Cubic Law for Fluid Flow in a Deformable Rock Fracture.
W81-01969 2F

Submerged Horizontal Jet over Erodible Bed.
W81-02079 2J

FLOW CHARACTERISTICS
Streamflow Characteristics of the Yellowstone River Basin, Montana, through 1976.
W81-02041 2E

FLOW RESISTANCE
General Algorithm for Rough Conduit Resistance.
W81-02078 8B

FLY ASH
Element Flow in Aquatic Systems Surrounding Coal-Fired Plants; Wisconsin Power Plant Impact Study.
W81-01934 5B

FOOD PROCESSING INDUSTRY
Use of Equivalent BOD as a New Waste Management Tool.
W81-02088 5A

FRANCE
Disinfection of Secondary Treated Effluent with Ozone. (Disinfection Des Eaux Residuaires Urbaines Par L'Ozone.).
W81-02116 5D

FRESHWATER FISH
Accumulation and Metabolism of Persistent Pesticides in Freshwater Fish.
W81-01914 5C

FROST HEAVING
A Model for the Prediction of Ice Lensing and Frost Heave in Soils.
W81-01965 2C

FROTH FLOTATION
Lead Removal with Adsorbing Colloid Flotation.
W81-02085 5D

FUEL
Mill's Conversion of Solid Waste into Fuel Yields Energy Savings.
W81-01995 5E

FUELS
The Quantitative and Qualitative Analysis of the Water Soluble Fraction of Jet Fuels.
W81-01980 5A

FULVIC ACIDS
Factors Influencing the Formation of Haloforms in the Chlorination of Humic Materials.
W81-02143 5B

GAS CHROMATOGRAPHY
Determination of Arenes, Vinyl Chloride, and Other Volatile Haloorganic Compounds in Water at Microgram-Per-Liter Levels by Gas Chromatography.
W81-02150 5A

GEOLOGIC FRACTURES
Validity of Cubic Law for Fluid Flow in a Deformable Rock Fracture.
W81-01969 2F

GEOLOGICAL FAULTS
Faulting Caused by Groundwater Level Declines, San Joaquin Valley, California.
W81-01968 2E

GEOMORPHOLOGY
A Representation of an Instantaneous Unit Hydrograph from Geomorphology.
W81-01961 2E

GEORGIA
Political Aspects of Urban Stormwater Management.
W81-02118 2E

GOVERNMENT FINANCE
Financing Waste Water Treatment in Japan.
W81-02101 6C

R&D at EPA: Uphill Responsibilities and Downhill Funding.
W81-02113 5G

A Synopsis of Perspectives on the Innovative and Alternative Technology Program.
W81-02114 6E

GRAND RIVER (ONTARIO)
Characterization, Magnitude and Impact of Urban Runoff in the Grand River Basin.
W81-01926 5B

GREAT LAKES
Synergistic Effects of Phosphorus and Heavy Metal Loadings on Great Lakes Phytoplankton.
W81-01918 5C

Aspects of the Interaction Between Benthos and Sediments in the North American Great Lakes and Effects of Toxicant Exposures.
W81-01920 5C

GREAT PLAINS
Snowfall and its Potential Management in the Semiarid Central Great Plains.
W81-01941 3F

GROUNDWATER
Faulting Caused by Groundwater Level Declines, San Joaquin Valley, California.
W81-01968 2E

Maps Showing Groundwater Conditions in the Hassayampa Area, Maricopa and Yavapai Counties, Arizona--1978.
W81-02028 7C

Water Resources Data for Florida, Water Year 1979--Volume 1. Northeast Florida
W81-02029 7C

Land-Surface Subsidence in the Texas Coastal Region.
W81-02031 2F

Groundwater Hydrology of the Sagebrush Flat Area and Possible Relations to the Discharge of Rattlesnake Springs, Grant and Douglas Counties, Washington.
W81-02032 2F

Water-Supply Assessment of the Laramie-Fox Hills Aquifer in Parts of Adams, Boulder, Jefferson, and Weld Counties, Colorado,
W81-02033 4B

Groundwater Availability in Carbonate Rocks of the Dandridge Area, Jefferson County, Tennessee,
W81-02034 2F

Hydrology of the Seldovia Area, Alaska,
W81-02037 2F

Hydrologic Data for Okaloosa, Walton, and Southeastern Santa Rosa Counties, Florida,
W81-02043 7C

GROUNDWATER AVAILABILITY
Groundwater Availability in Carbonate Rocks of the Dandridge Area, Jefferson County, Tennessee,
W81-02034 2F

GROUNDWATER MANAGEMENT
Drought Mitigation Strategy: Conjunctive Use in Smith Valley, Nevada,
W81-01997 6E

GROUNDWATER MOVEMENT
A Mixed Numerical Analytical Method for Groundwater Flow Simulation,
W81-01966 2F

Instability in Aquifer Identification: Theory and Case Studies,
W81-01972 2F

Theoretical Head Variograms for Steady Flow in Statistically Homogeneous Aquifers,
W81-01973 2F

GROUNDWATER POTENTIAL
Analytical Study of the Ogallala Aquifer in Sherman County, Texas, Projections of Saturated Thickness, Volume of Water in Storage, Pumpage Rates, Pumping Lifts, and Well Yields,
W81-02000 4B

Analytical Study of the Ogallala Aquifer in Moore County, Texas, Projections of Saturated Thickness, Volume of Water in Storage, Pumpage Rates, Pumping Lifts, and Well Yields,
W81-02001 4B

Analytical Study of the Ogallala Aquifer in Armstrong County, Texas, Projections of Saturated Thickness, Volume of Water in Storage, Pumpage Rates, Pumping Lifts, and Well Yields,
W81-02002 4B

GROUNDWATER-RECHARGE
Analytical Study of the Ogallala Aquifer in Randall County, Texas, Projections of Saturated Thickness, Volume of Water in Storage, Pumpage Rates, Pumping Lifts, and Well Yields,
W81-02005 4B

Analytical Study of the Ogallala Aquifer in Swisher County, Texas, Projections of Saturated Thickness, Volume of Water in Storage, Pumpage Rates, Pumping Lifts, and Well Yields,
W81-02006 4B

GROUNDWATER RESOURCES
Groundwater Models for Water Resources Planning,
W81-02035 2F

GROWTH STAGES
Age Specifics of Sensitivity and Resistance of Fish to Organic and Inorganic Poisons,
W81-01917 5C

HABITAT IMPROVEMENT
Effects of Stream Habitat Improvements on Invertebrates, Trout Populations, and Mink Activity,
W81-02091 8I

HARBORS
Effect of Construction and Use of a Harbor-Industrial Complex on the Distribution and Evolution of the Benthic Population of a Mediterranean Gulf (Gulf of Fos). (Influence De La Construction Et L'Exploitation D'Un Complexe Portuaire Et Industriel Sur La Distribution Et L'Evolution Des Peuplements Benthiques Littorauz D'Un Golfe Mediterraneen (Golfe De Fos)),
W81-02130 5C

HARDNESS (WATER)
Species of Dissolved Metals Derived from Oligotrophic Hard Water,
W81-01989 5A

HASSAYAMPA AREA (AZ)
Maps Showing Groundwater Conditions in the Hassayampa Area, Maricopa and Yavapai Counties, Arizona--1978,
W81-02028 7C

HAWAII
Sediment Losses from Small Agricultural Watersheds in Hawaii (1972-77),
W81-01943 4D

An Analysis of the Magnitude and Frequency of Floods on Oahu, Hawaii,
W81-02042 2E

HAZARDOUS MATERIALS
Handling Hazardous Waste--An Unsolved Problem,
W81-02146 5B

HEAVY METALS
Synergistic Effects of Phosphorus and Heavy Metal Loadings on Great Lakes Phytoplankton,
W81-01918 5C

Heavy Metals and Marine Diatoms: Influence of Dissolved Organic Compounds on Toxicity and Selection for Metal Tolerance among Four Species,
W81-01978 5C

HIGHWAYS
Development of an Urban Highway Storm Drainage Model Based on SWMM,
W81-01927 8A

HOUSTON-GALVESTON AREA (TX)
Land-Surface Subsidence in the Texas Coastal Region,
W81-02031 2F

HUMIC ACIDS
Factors Influencing the Formation of Haloforms in the Chlorination of Humic Materials,
W81-02143 5B

HURON (SD)
Preventing Haloform Formation in Drinking Water,
W81-01933 5F

HURRICANES
An Assessment of Storm Surge Modeling,
W81-01935 2L

HYDRAULIC CONDUCTIVITY
A Simplified Functions Approach for Determining Soil Hydraulic Conductivities and Water Characteristics In Situ,
W81-01999 2G

HYDRAULIC ROUGHNESS
General Algorithm for Rough Conduit Resistance,
W81-02078 8B

HYDRAULIC STRUCTURES
Air-Water Flow in Hydraulic Structures,
W81-01936 8A

HYDROELECTRIC PLANTS
Water and Power Resources Service Project Data,
W81-02011 8A

A First in South Africa: The Steenbras Pumped Storage Scheme,
W81-02051 8C

HYDROGEN ION CONCENTRATION
Prediction of the Calcium Carbonate Saturation pH in Cooling Water,
W81-02135 5C

HYDROGEOLOGY
Hydrology of the Seldovia Area, Alaska,
W81-02037 2F

HYDROGRAPHS
Hydrograph Synthesis by the HNV-SBUH Method Utilizing a Programmable Calculator,
W81-01929 2E

Real-Time Forecasting with a Conceptual Hydrologic Model. I. Analysis of Uncertainty,
W81-01962 6A

HYDROLOGIC ASPECTS
Hydrological Aspects and a Barrier to Further Escape of Slimes,
W81-02061 8A

HYDROLOGIC DATA
Water Resources Data for Florida, Water Year 1979--Volume 1. Northeast Florida,
W81-02029 7C

Hydrology of Selected Basins in the Warrior Coal Field, Alabama--A Progress Report,
W81-02038 6A

Hydrologic Data for Okaloosa, Walton, and Southeastern Santa Rosa Counties, Florida,
W81-02043 7C

HYDROLOGIC MODELS
Real-Time Forecasting with a Conceptual Hydrologic Model. 2. Applications and Results,
W81-01963 6A

Drought Mitigation Strategy: Conjunctive Use in Smith Valley, Nevada,
W81-01997 6E

HYDROLOGIC SYSTEMS
Hydrologic Networks: Information Transmission,
W81-02119 7A

ICE LENSES
A Model for the Prediction of Ice Lensing and Frost Heave in Soils,
W81-01965 2C

IDAHO
Spatial and Seasonal Precipitation Distribution in Southwest Idaho,
W81-01938 2B

ILLINOIS
Feasibility of Water Quality Improvement in Three Illinois Rivers,
W81-02083 5G

ILLINOIS RIVER
X-Ray Analysis of Sediment Regions and Transport of Sediment Particular Material on the Gill of the Fingernail Clam, Musculium Transversum,
W81-01903 5C

Silicon Substitution for Calcium in the Shell of the Fingernail Clam, Musculium Transversum Studied by X-Ray Analysis,
W81-01904 5C

IMPERVIOUS SOILS
Benefits of Drainage and Irrigation a Claypan Soil.
W81-01944 3F

INCINERATION
Mill's Conversion of Solid Waste into Fuel Yields Energy Savings.
W81-01995 5E

INDIA
Effect of Industrial Pollution on the Kalu River Ecosystem,
W81-02145 5C

INDUS RIVER
Case Study on Waterlogging and Salinity Problems in Pakistan,
W81-01953 3F

INDUSTRIAL WASTES
Use of Equivalent BOD as a New Waste Management Tool,
W81-02088 5A

Control of Industrial Waste Water in Osaka,
W81-02110 5D

Tannery Waste Water Treatment by the Oxygen Activated Sludge Process,
W81-02111 5D

Effect of Construction and Use of a Harbor-Industrial Complex on the Distribution and Evolution of the Benthic Population of a Mediterranean Gulf (Gulf of Fos). W81-02127 5B

Contribution of Marine Algae to Trihalomethane Production in Chlorinated Estuarine Water,
W81-02131 5B

MARYLAND
Water Quality in Rhode River at Smithsonian Institution Pier Near Annapolis, Maryland, January 1976 Through December 1978,
W81-02040 5A

MATHEMATICAL MODELS
A Cost-Benefit Analysis of Water Use Restrictions,
W81-01952 3D

Distribution Methods for Transferable Discharge Permits,
W81-01960 5G

A Representation of an Instantaneous Unit Hydrograph from Geomorphology,
W81-01961 2E

A Mixed Numerical Analytical Method for Groundwater Flow Simulation,
W81-01966 2F

Energy Criteria for Water use,
W81-02008 6B

Digital Model of the Bayou Bartholomew Alluvial Aquifer-Stream System, Arkansas,
W81-02044 6A

Modeling Supplemental Irrigation Water Demand,
W81-02082 4B

Rain Infiltration into Layered Soils: Prediction,
W81-02092 2G

Modeling and Prediction of Specific Compound Adsorption by Activated Carbon and Synthetic Adsorbents,
W81-02136 5D

MATHEMATICAL STUDIES
Validity of Cubic Law for Fluid Flow in a Deformable Rock Fracture,
W81-01969 2F

Prediction of the Calcium Carbonate Saturation pH in Cooling Water,
W81-02135 5C

MEASUREMENT
Survey of Methods for Soil Moisture Determination,
W81-01970 2G

MEDITERRANEAN
Effect of Construction and Use of a Harbor-Industrial Complex on the Distribution and Evolution of the Benthic Population of a Mediterranean Gulf (Gulf of Fos). (Influence De La Construction Et L'Exploitation D'Un Complexe Portuaire Et Industriel Sur La Distribution Et L'Evolution Des Peuplements Benthiques Littorauz D'Un Golfe Mediterraneen (Golfe De Fos)),
W81-02130 5C

MEDITERRANEAN SEA
Study of Littoral Currents in Costa Del Sol in Relation to the Placement of Submarine Outfalls Envisioned in the Comprehensive Treatment Plan. (Estudio De Corrientes Litorales En La Costa Del Sol, En Relacion Con Los Emplazamientos De Emisarios Submarinos Previstos En El Proyecto De Saneamiento Integral),
W81-01975 6A

MERCURY
Control of Mercury Pollution in Japan and the Minamata Bay Cleanup,
W81-02097 5E

METABOLISM
Ionophore-Mediated Calcium Control of Ciliary Arrest in the Fingernail Clam, Musculium Transversum,
W81-01945 5C

METALS
Species of Dissolved Metals Derived from Oligotrophic Hard Water,
W81-01989 5A

Other Elements; Water Quality Standards; Criteria Summaries; A Compilation of State/Federal Criteria.
W81-02023 5G

Trace Metals and Anaerobic Digestion of Leachate,
W81-02094 5D

MICROCALORIMETRY
Determination of Hydrolytic Activities in Waste Water Systems by Microcalorimetry,
W81-01984 5D

MICROCOSM STUDIES
Microcosm System Study of Algal Bloom Formation,
W81-02095 5C

MINAMATA BAY
Control of Mercury Pollution in Japan and the Minamata Bay Cleanup,
W81-02097 5E

MINE DRAINAGE
Pipeline Solves Far West Rand Mines Water Problem.
W81-02049 8A

MINE WASTES
Epipelic Algal Communities in a Eutrophic Northern Lake Contaminated with Mine Wastes,
W81-01982 5C

Slimes Consolidation at the Henderson Mine,
W81-02014 5D

MINE WATER
Slimes Consolidation at the Henderson Mine,
W81-02014 5D

Pipeline Solves Far West Rand Mines Water Problem.
W81-02049 8A

MINING ENGINEERING
Lessons from the Bafokeng Disaster,
W81-02056 8A

MINNESOTA
Baseline Water Quality of Schmidt, Hornbeam, and Horseshoe Lakes, Dakota County, Minnesota,
W81-02039 6A

Hydrologic Impact of Draining Small Depressional Watersheds,
W81-02080 2E

MIXING
Field Measurement of Transverse Diffusion in Undirectional Flow in a Wide, Straight Channel,
W81-02140 5B

MODE OF ACTION
Cilio-Inhibitory Effects of Bronchial Nerve Stimulation, Dopamine, Pentylenetetrazole and Visible Light in the Mussel, Mytilus Edulis,
W81-01947 5C

MODEL STUDIES
Combined Sewer System Analysis Using Storm and SWMM for the City of Cornwall,
W81-01922 5D

Considerations Regarding the Application of SCS TR-55 Procedures for Runoff Computations,
W81-01923 2E

A Simplified Stormwater Quantity and Quality Model,
W81-01924 2E

Methodology for 'Lumped' SWMM Modelling,
W81-01925 2E

Development of an Urban Highway Storm Drainage Model Based on SWMM,
W81-01927 8A

Kinematic Design Storms Incorporating Spatial and Time Averaging,
W81-01928 2B

Hydrograph Synthesis by the HNV-SBUH Method Utilizing a Programmable Calculator,
W81-01929 2E

Detention Lake Application in Master Drainage Planning,
W81-01930 4A

Alternative Urban Flood Relief Measures; A Case Study; City of Regina, Saskatchewan, Canada,
W81-01931 4A

An Assessment of Storm Surge Modeling
W81-01935 2L

Model of Time and Space Distribution of Rainfall in Arizona and New Mexico,
W81-01939 2B

Analysis of a Chance-Constrained Reservoir Control Model,
W81-01959 4A

Real-Time Forecasting with a Conceptual Hydrologic Model. I. Analysis of Uncertainty,
W81-01962 6A

Modelling the Biochemical Oxidation Processes in Artificial Conditions of Waste Treatment Plants,
W81-01976 5D

Groundwater Models for Water Resources Planning,
W81-02035 2F

Digital Model of the Bayou Bartholomew Alluvial Aquifer-Stream System, Arkansas,
W81-02044 6A

Generation of Polluting Loads within River Basins,
W81-02134 5B

A Steady State Eutrophication Model for Lakes,
W81-02139 5C

Field Measurement of Transverse Diffusion in Undirectional Flow in a Wide, Straight Channel,
W81-02140 5B

MOISTURE STRESS
Plant and Canopy Temperatures in Corn as Influenced by Differential Moisture Stress,
W81-01948 3F

MONITORING
Monitoring Contaminant Residues in Freshwater Fishes in the United States: The National Pesticide Monitoring Program,
W81-01913 5C

A Long-Term Data Base for the Investigation of Urban Runoff Pollution,
W81-01932 5B

Estimation of the Downstream River Water Quality with a Pollution Land-Use Data Bank,
W81-01951 7B

An Organic Monitoring System for the Ohio River,
W81-01992 7A

MONTANA
Streamflow Characteristics of the Yellowstone River Basin, Montana, through 1976,
W81-02041 2E

MOORE COUNTY (TX)
Analytical Study of the Ogallala Aquifer in Moore County, Texas, Projections of Saturated Thickness, Volume of Water in Storage, Pumpage Rates, Pumping Lifts, and Well Yields,
W81-02001 4B

MOUNT ST. HELENS (WA)
Mount St. Helens Ash Fall in the Bull Run Watershed, Oregon, May-June 1980,
W81-02036 5B

MUNICIPAL WASTES
A Guide to Regulations and Guidance for the Utilization and Disposal of Municipal Sewage Sludge.
W81-02012 5E

Nagoya Sewerage Plan,
W81-02108 5D

Gas-Chromatographic/Mass-Spectrometric Analysis of Derivatized Amino Acids in Municipal Waste Water Products,
W81-02128 5A

MUNICIPAL WATER
Urban Water Economy: A Master Plan,
W81-02063 3D

MUSSELS
The Regulation of Intracellular Calcium and the Release of Neurotransmitters in the Mussel, Mytilus Edulis,
W81-01946 5C

Cilio-Inhibitory Effects of Bronchial Nerve Stimulation, Dopamine, Pentylenetetrazole and Visible Light in the Mussel, Mytilus Edulis,
W81-01947 5C

MYTILUS EDULIS
Cilio-Inhibitory Effects of Bronchial Nerve Stimulation, Dopamine, Pentylenetetrazole and Visible Light in the Mussel, Mytilus Edulis,
W81-01947 5C

MYTILUS ENDULIS
The Regulation of Intracellular Calcium and the Release of Neurotransmitters in the Mussel, Mytilus Edulis,
W81-01946 5C

NAGOYA (JAPAN)
Nagoya Sewerage Plan,
W81-02108 5D

NATIONAL RECREATION AREAS
Outdoor Recreational Use and Participation Inventory of the Lake Mead National Recreation Area,
W81-01937 6D

NETWORK DESIGN
Hydrologic Networks: Information Transmission,
W81-02119 7A

NEVADA
Drought Mitigation Strategy: Conjunctive Use in Smith Valley, Nevada,
W81-01997 6E

NEW MEXICO
Model of Time and Space Distribution of Rainfall in Arizona and New Mexico,
W81-01939 2B

NIGERIA
Perception of Water Quality in Some Villages of the Savanna Zone of Nigeria,
W81-01949 3D

NILE RIVER
Strategy for Irrigation Development in Egypt up to the Year 2000,
W81-01950 3F

NITRIFICATION
Feasibility of On-Site Denitrification of Waste Water by Separation of Grey and Blackwater,
W81-01901 5D

Phenol and Free Ammonia Inhibition to Nitrosomonas Activity,
W81-02138 5D

NITRILOTRIACETIC ACID
Behaviour of Nitrilotriacetic Acid during Groundwater Recharge,
W81-01981 5B

NITRITES
Recent Advances in the Study of Nitrite Toxicity to Fishes,
W81-01921 5C

NITROGEN COMPOUNDS
Nitrogen-Ammonia/Nitrate/Nitrite; Water Quality Standards; Criteria Summaries; A Compilation of State/Federal Criteria.
W81-02019 5G

Prediction of Alkalinity Changes in the Activated Sludge Process,
W81-02089 5D

NORTHEAST FLORIDA
Water Resources Data for Florida, Water Year 1979--Volume 1. Northeast Florida.
W81-02029 7C

NORTHEAST U.S.
A Steady State Eutrophication Model for Lakes,
W81-02139 5C

NUTRIENT REMOVAL
Advanced Waste Water Treatment Removes Nutrients without Chemicals,
W81-02132 5D

NUTRIENT REQUIREMENTS
The Regulation of Intracellular Calcium and the Release of Neurotransmitters in the Mussel, Mytilus Edulis,
W81-01946 5C

Cilio-Inhibitory Effects of Bronchial Nerve Stimulation, Dopamine, Pentylenetetrazole and Visible Light in the Mussel, Mytilus Edulis,
W81-01947 5C

NUTRIENTS
A Comparison of Nutrient Sources and Behavior in Two Lowland Subcatchments of the River Wye,
W81-01974 5B

OAHU (HI)
An Analysis of the Magnitude and Frequency of Floods on Oahu, Hawaii,
W81-02042 2E

OCEAN CURRENTS
Study of Littoral Currents in Costa Del Sol in Relation to the Placement of Submarine Outfalls Envisioned in the Comprehensive Treatment Plan. (Estudio De Corrientes Litorales En La Costa Del Sol, En Relacion Con Los Emplazamientos De Emisarios Submarinos Previstos En El Proyecto De Saneamiento Integral),
W81-01975 6A

ODOR
Odor Control of Waste Water Treatment Plants,
W81-02105 5D

OGALLALA AQUIFER
Analytical Study of the Ogallala Aquifer in Armstrong County, Texas, Projections of Saturated Thickness, Volume of Water in Storage, Pumpage Rates, Pumping Lifts, and Well Yields,
W81-02002 4B

OGALLALA AQUIFER (TX)
Analytical Study of the Ogallala Aquifer in Sherman County, Texas, Projections of Saturated Thickness, Volume of Water in Storage, Pumpage Rates, Pumping Lifts, and Well Yields,
W81-02000 4B

Analytical Study of the Ogallala Aquifer in Moore County, Texas, Projections of Saturated Thickness, Volume of Water in Storage, Pumpage Rates, Pumping Lifts, and Well Yields,
W81-02001 4B

Analytical Study of the Ogallala Aquifer in Randall County, Texas, Projections of Saturated Thickness, Volume of Water in Storage, Pumpage Rates, Pumping Lifts, and Well Yields,
W81-02005 4B

Analytical Study of the Ogallala Aquifer in Swisher County, Texas, Projections of Saturated Thickness, Volume of Water in Storage, Pumpage Rates, Pumping Lifts, and Well Yields,
W81-02006 4B

OHIO RIVER
An Organic Monitoring System for the Ohio River,
W81-01992 7A

OIL POLLUTION
Gulf Pollution--UN's Other Worry,
W81-01979 5B

OIL SHALES
Elemental Partitioning in an Aboveground Oil Shale Retort Pilot Plant,
W81-02141 5B

OKALOOSA COUNTY (FL)
Hydrologic Data for Okaloosa, Walton, and Southeastern Santa Rosa Counties, Florida,
W81-02043 7C

OKLAHOMA
A Depth-Area-Duration Model of Storm Rainfall in the Southern Great Plains,
W81-01964 2B

Impact of Stream Alterations on Riparian Communities in Southcentral Oklahoma,
W81-02025 6G

OPTIMIZATION
Problems in Applying Optimal Irrigation Plans,
W81-02123 6E

OREGON
Mount St. Helens Ash Fall in the Bull Run Watershed, Oregon, May-June 1980,
W81-02036 5B

ORGANIC ACIDS
Volatile Organic Acids in Raw Waste Water and in Physico-Chemical Treatment,
W81-01990 5D

ORGANIC COMPOUNDS
Cilio-Inhibitory Effects of Bronchial Nerve Stimulation, Dopamine, Pentylenetetrazole and Visible Light in the Mussel, Mytilus Edulis,
W81-01947 5C

An Organic Monitoring System for the Ohio River,
W81-01992 7A

Design of Aeration Towers to Strip Volatile Contaminants from Drinking Water,
W81-02071 5F

Water Quality Conversion Matrix of Aerobic Biological Processes,
W81-02096 5D

Organic Compounds in an Industrial Waste Water. Their Transport into Sediments,
W81-02144 5B

Determination of Arenes, Vinyl Chloride, and Other Volatile Haloorganic Compounds in Water at Microgram-Per-Liter Levels by Gas Chromatography,
W81-02150 5A

ORGANOPHOSPHORUS PESTICIDES
Organophosphorus Pesticides and Their Hazards to Aquatic Animals,
W81-01912 5C

OUTFALL SEWERS
The Application of E.E.C. Bathing Water Standards to the Design of Sea Outfalls,
W81-01958 5D

Marine Studies on a Coastline with Sewage Outfalls,
W81-02126 5C

Prediction of the Contamination Produced by Dispersion of Effluents through Ocean Outfalls. (Prediccion De Los Niveles De Contaminacion Producidos Por Vertidos Realizados a Traves De Emisarios Submarinos.),
W81-02129 5B

OVERDRAFT
Land-Surface Subsidence in the Texas Coastal Region,
W81-02031 2F

OVERFLOW
Challenging Combined Sewer Problems in Japan,
W81-02103 4C

Mathematical Model for Improving Combined Sewer Systems,
W81-02104 4A

OXIDATION
Modelling the Biochemical Oxidation Processes in Artificial Conditions of Waste Treatment Plants,
W81-01976 5D

OXYGEN REQUIREMENTS
Oxygen Uptake as a Control Parameter,
W81-02098 5D

OZONATION
Disinfection of Secondary Treated Effluent with Ozone. (Disinfection Des Eaux Residuaires Urbaines Par L'Ozone.),
W81-02116 5D

OZONE
Development of the Facts Procedure for Combined Forms of Chlorine and Ozone in Aqueous Solutions,
W81-02142 5A

PAKISTAN
Case Study on Waterlogging and Salinity Problems in Pakistan,
W81-01953 3F

PATH OF POLLUTANTS
Particulate and Dissolved Trace Metals in Lake Ontario,
W81-01983 5B

PEAK DISCHARGE
An Analysis of the Magnitude and Frequency of Floods on Oahu, Hawaii,
W81-02042 2E

PERMETHRIN
The Control of Animals in Water Mains Using Permethrin, A Synthetic Pyrethroid,
W81-01905 5F

PERMITS
Cost-Efficiency of Transferable Discharge Permits for the Control of BOD Discharges,
W81-01967 6C

PERSIAN GULF
Gulf Pollution--UN's Other Worry,
W81-01979 5B

PESTICIDE RESIDUES
Accumulation and Metabolism of Persistent Pesticides in Freshwater Fish,
W81-01914 5C

PESTICIDE TOXICITY
The Control of Animals in Water Mains Using Permethrin, A Synthetic Pyrethroid,
W81-01905 5F

PESTICIDES
Monitoring Contaminant Residues in Freshwater Fishes in the United States: The National Pesticide Monitoring Program,
W81-01913 5C

Age Specifics of Sensitivity and Resistance of Fish to Organic and Inorganic Poisons,
W81-01917 5C

Separation of Lindane from its Aqueous Solutions by Reverse Osmosis System,
W81-01996 5D

Pesticides; Water Quality Standards; Criteria Summaries; A Compilation of State/Federal Criteria.
W81-02020 5G

Sorption Capacities of Graphitized Carbon Black in Determination of Chlorinate Pesticide Traces in Water,
W81-02149 5A

PHENOLS
Organics; Water Quality Standards; Criteria Summaries; A Compilation of State/Federal Criteria.
W81-02016 5G

Phenol and Free Ammonia Inhibition to Nitrosomonas Activity,
W81-02138 5D

PHOSPHORUS
Changes in Phosphorus Concentrations Due to Mixing by Motorboats in Shallow Lakes,
W81-02007 2H

Phosphorus; Water Quality Standards; Criteria Summaries; A Compilation of State/Federal Criteria.
W81-02024 5G

Eutrophication in Emilia-Romagna Coastal Waters (North Adriatic Sea, Italy): A Case History,
W81-02086 5C

PHYSICAL MODELS
A Model for the Prediction of Ice Lensing and Frost Heave in Soils,
W81-01965 2C

PHYTOPLANKTON
Synergistic Effects of Phosphorus and Heavy Metal Loadings on Great Lakes Phytoplankton,
W81-01918 5C

Tidal and Diel Fluctuations in the Temporal Concentrations of Chlorophyll A and Pheophytin at a Station Monitoring a High-Marsh Creek,
W81-02076 2L

PILOT PLANTS
Behaviour of Nitrilotriacetic Acid during Groundwater Recharge,
W81-01981 5B

New York City's Pilot Plant Filter Studies. Part Two,
W81-01993 5F

Current Research on Advanced Waste Water Treatment in Japan,
W81-02112 5D

Elemental Partitioning in an Aboveground Oil Shale Retort Pilot Plant,
W81-02141 5B

PINEAPPLES
Sediment Losses from Small Agricultural Watersheds in Hawaii (1972-77),
W81-01943 4D

PIPE FLOW
Sediment Suspension in Turbulent Pipe Flow,
W81-02077 8B

PIPELINES
Pipeline Solves Far West Rand Mines Water Problem.
W81-02049 8A

Submarine Transmission Line: Lifeline for Vieques,
W81-02073 5F

PIPES
Response of Lead Solubility to Dissolved Carbonate in Drinking Water,
W81-02070 5B

PLANNING
Groundwater Models for Water Resources Planning,
W81-02035 2F

Stochastic Approach to Waste Treatment Planning,
W81-02122 6A

Problems in Applying Optimal Irrigation Plans,

RHODE RIVER ESTUARY (MD)
Water Quality in Rhode River at Smithsonian Institution Pier Near Annapolis, Maryland, January 1976 Through December 1978,
W81-02040 5A

RHODESIA
Urban Water Supply -- A Statistical Survey,
W81-02054 5F

RIVER BASINS
Streamflow Characteristics of the Yellowstone River Basin, Montana, through 1976,
W81-02041 2E

Generation of Polluting Loads within River Basins,
W81-02134 5B

RIVER BEDS
X-Ray Analysis of Sediment Regions and Transport of Sediment Particular Material on the Gill of the Fingernail Clam, Musculium Transversum,
W81-01903 5C

RIVER SYSTEMS
River Management in the Urban Environment,
W81-02050 4C

RIVERS
Water Quality in Rhode River at Smithsonian Institution Pier Near Annapolis, Maryland, January 1976 Through December 1978,
W81-02040 5A

Feasibility of Water Quality Improvement in Three Illinois Rivers,
W81-02083 5G

ROAD CONSTRUCTION
Baseline Water Quality of Schmidt, Hornbeam, and Horseshoe Lakes, Dakota County, Minnesota,
W81-02039 6A

ROCK FILL DAMS
Raising Stettynskloof Dam.
W81-02062 8D

RUNOFF
Hydrograph Synthesis by the HNV-SBUH Method Utilizing a Programmable Calculator,
W81-01929 2E

A Comparison of Nutrient Sources and Behavior in Two Lowland Subcatchments of the River Wye,
W81-01974 5B

Flood of February 1980 Along the Agua Fria River, Maricopa County, Arizona,
W81-02027 2E

Hydrologic Impact of Draining Small Depressional Watersheds,
W81-02080 2E

RUNOFF FORECASTING
Considerations Regarding the Application of SCS TR-55 Procedures for Runoff Computations,
W81-01923 2E

A Depth-Area-Duration Model of Storm Rainfall in the Southern Great Plains,
W81-01964 2B

RURAL AREAS
Perception of Water Quality in Some Villages of the Savanna Zone of Nigeria,
W81-01949 3D

The Elements of Quality and Social Costs in Rural Water Supply and Utilization,
W81-01954 6D

SALTERSFORD (UK)
Central Lincolnshire Scheme Moves Ahead.
W81-01956 5F

SANITARY ENGINEERING
Oxygen Uptake as a Control Parameter,
W81-02098 5D

SANTA BARBARA URBAN METHOD (RUNOFF)
Hydrograph Synthesis by the HNV-SBUH Method Utilizing a Programmable Calculator,
W81-01929 2E

SANTA ROSA COUNTY (FL)
Hydrologic Data for Okaloosa, Walton, and Southeastern Santa Rosa Counties, Florida,
W81-02043 7C

SATELLITES (ARTIFICIAL)
Surface Water Inventory through Satellite Sensing,
W81-02115 7B

SAVANNAH RIVER
Modeling Reservoir System with Pumped Storage,
W81-02068 8A

SEA WATER
Eutrophication in Emilia-Romagna Coastal Waters (North Adriatic Sea, Italy): A Case History,
W81-02086 5C

Marine Studies on a Coastline with Sewage Outfalls,
W81-02126 5C

SEDIMENT TRANSPORT
Submerged Horizontal Jet over Erodible Bed,
W81-02079 2J

SEDIMENTATION
Mathematical Modeling of Circulation in Baker Bay, Washington/Oregon,
W81-02010 2L

SEDIMENTS
X-Ray Analysis of Sediment Regions and Transport of Sediment Particular Material on the Gill of the Fingernail Clam, Musculium Transversum,
W81-01903 5C

Aspects of the Interaction Between Benthos and Sediments in the North American Great Lakes and Effects of Toxicant Exposures,
W81-01920 5C

Trap Efficiency Study, Highland Creek Flood Retarding Reservoir Near Kelseyville, California, Water Years 1966-77,
W81-02030 2J

A Preliminary Analysis of Bacterial Numbers and Biomass in Langebaan Lagoon,
W81-02055 5A

Sediment Suspension in Turbulent Pipe Flow,
W81-02077 8B

Organic Compounds in an Industrial Waste Water. Their Transport into Sediments,
W81-02144 5B

SELDOVIA AREA (AK)
Hydrology of the Seldovia Area, Alaska,
W81-02037 2F

SEPARATION TECHNIQUES
The Quantitative and Qualitative Analysis of the Water Soluble Fraction of Jet Fuels,
W81-01980 5A

Solid Liquid Separation by Filtration -- A Review.
W81-02048 5D

SETTLING BASINS
Notes and Comments: The Problem With Perforated Baffles,
W81-02069 5F

SEWAGE
Study of Littoral Currents in Costa Del Sol in Relation to the Placement of Submarine Outfalls Envisioned in the Comprehensive Treatment Plan. (Estudio De Corrientes Litorales En La Costa Del Sol, En Relacion Con Los Emplazamientos De Emisarios Submarinos Previstos En El Proyecto De Saneamiento Integral),
W81-01975 6A

Marine Studies on a Coastline with Sewage Outfalls,
W81-02126 5C

SEWAGE DISPOSAL
Combined Sewer System Analysis Using Storm and SWMM for the City of Cornwall,
W81-01922 5D

SEWAGE SLUDGE
Volatilization, Plant Uptake and Mineralization of Nitrogen in Soils Treated With Sewage Sludge,
W81-02009 5D

SEWAGE TREATMENT
Digital On-Line Closed-Loop Control for Waste Water Treatment Operation,
W81-02090 5D

Design and Performance of Night Soil Treatment Plants,
W81-02099 5D

Disinfection of Secondary Treated Effluent with Ozone. (Disinfection Des Eaux Residuaires Urbaines Par L'Ozone.),
W81-02116 5D

SEWERAGE
The Japan Sewage Works Agency - Its Role and Activities,
W81-02100 6E

Comprehensive Basin-Wide Planning of Sewer Systems,
W81-02102 6A

Waste Water Treatment Plants and Policies of Kyoto,
W81-02106 5D

Development of Sewer Systems and Treatment Plants in Tokyo,
W81-02107 5D

Nagoya Sewerage Plan,
W81-02108 5D

Sewer User Charges in Osaka,
W81-02109 6C

SHERMAN COUNTY (TX)
Analytical Study of the Ogallala Aquifer in Sherman County, Texas, Projections of Saturated Thickness, Volume of Water in Storage, Pumpage Rates, Pumping Lifts, and Well Yields,
W81-02000 4B

SILICATES
Silicon Substitution for Calcium in the Shell of the Fingernail Clam, Musculium Transversum Studied by X-Ray Analysis,
W81-01904 5C

SIMULATED RAINFALL
Model of Time and Space Distribution of Rainfall in Arizona and New Mexico,
W81-01939 2B

SIMULATION ANALYSIS
Modeling Reservoir System with Pumped Storage,
W81-02068 8A

SLIME
Slimes Consolidation at the Henderson Mine,
W81-02014 5D

SLIMES DAMS
Lessons from the Bafokeng Disaster,
W81-02056 8A

The Bafokeng Disaster and Its Legal Implications,
W81-02057 8A

Hydrological Aspects and a Barrier to Further Escape of Slimes,
W81-02061 8A

SLUDGE DISPOSAL
Mill's Conversion of Solid Waste into Fuel Yields Energy Savings.
W81-01995 5E

A Guide to Regulations and Guidance for the Utilization and Disposal of Municipal Sewage Sludge.
W81-02012 5E

Minimizing Sludge Handling and Energy Requirements for Advanced Waste Water Treatment,
W81-02087 5D

SLUDGE TREATMENT
Minimizing Sludge Handling and Energy Requirements for Advanced Waste Water Treatment,
W81-02087 5D

Filterbelt Pressing of Sludge--A Laboratory Simulation,
W81-02093 5D

SLUDGE UTILIZATION
Volatilization, Plant Uptake and Mineralization of Nitrogen in Soils Treated With Sewage Sludge,
W81-02009 5D

SNOW MANAGEMENT
Snowfall and its Potential Management in the Semiarid Central Great Plains,
W81-01941 3F

SOIL EROSION
Soil Erosion by Water as Related to Management of Tillage and Surface Residues, Terracing, and Contouring in Eastern Oregon,
W81-01940 4D

Sediment Losses from Small Agricultural Watersheds in Hawaii (1972-77),
W81-01943 4D

SOIL MANAGEMENT
Soil Erosion by Water as Related to Management of Tillage and Surface Residues, Terracing, and Contouring in Eastern Oregon,
W81-01940 4D

SOIL MOISTURE
Survey of Methods for Soil Moisture Determination,
W81-01970 2G

SOIL MOISTURE RETENTION
An Improved Procedure for Measuring Water Retention Curves at Low Suction by the Hanging-Water-Column Method,
W81-02147 2G

SOIL PROPERTIES
A Model for the Prediction of Ice Lensing and Frost Heave in Soils,
W81-01965 2C

SOIL TYPES
Soil Conditions Dictate Design of Lake Weir,
W81-01994 8A

SOIL WATER MOVEMENT
A Simplified Functions Approach for Determining Soil Hydraulic Conductivities and Water Characteristics In Situ,
W81-01999 2G

SOIL-WATER-PLANT RELATIONSHIPS
Linearized Moisture Flow with Root Extraction for Three Dimensional, Steady Conditions,
W81-01998 2I

SORGHUM
Volatilization, Plant Uptake and Mineralization of Nitrogen in Soils Treated With Sewage Sludge,
W81-02009 5D

SOUTH AFRICA
Domestic Water Meters in South Africa,
W81-02046 3D

Energy and Water Conservation Research and the Local Authority,
W81-02047 3D

Pipeline Solves Far West Rand Mines Water Problem.
W81-02049 8A

A First in South Africa: The Steenbras Pumped Storage Scheme.
W81-02051 8C

Steenbras Reservoir: Trout Plantings and Recoveries,
W81-02052 8I

Urban Water Supply -- A Statistical Survey,
W81-02054 5F

A Preliminary Analysis of Bacterial Numbers and Biomass in Langebaan Lagoon,
W81-02055 5A

Lessons from the Bafokeng Disaster,
W81-02056 8A

The Bafokeng Disaster and Its Legal Implications,
W81-02057 8A

Urban Waste Water Pollution Control in South Africa,
W81-02059 5D

Cape Town Water Augmentation Scheme.
W81-02060 8A

Hydrological Aspects and a Barrier to Further Escape of Slimes,
W81-02061 8A

Raising Stettynskloof Dam.
W81-02062 8D

Urban Water Economy: A Master Plan,
W81-02063 3D

Linksfield Reservoir: Johannesburg.
W81-02064 8A

Rand Water Board,
W81-02065 6D

The Effect of Metering on Urban Water Consumption,
W81-02066 3D

Durban's Water Supply,
W81-02067 6D

SOUTH CAROLINA
Contribution of Marine Algae to Trihalomethane Production in Chlorinated Estuarine Water,
W81-02131 5B

SOYBEANS
Soybean Row Spacing and Soil Water Supply: Their Effect on Growth, Development, Water Relations, and Mineral Uptake,
W81-01942 2I

SPAIN
Prediction of the Contamination Produced by Dispersion of Effluents through Ocean Outfalls. (Prediccion De Los Niveles De Contaminacion Producidos Por Vertidos Realizados a Traves De Emisarios Submarinos.),
W81-02129 5B

SPRINKLER IRRIGATION
Comparison of Sprinkler Uniformity Models,
W81-02081 4B

STANDARDS
Design and Performance of Night Soil Treatment Plants,
W81-02099 5D

STATISTICAL METHODS
Real-Time Forecasting with a Conceptual Hydrologic Model. I. Analysis of Uncertainty,
W81-01962 6A

Real-Time Forecasting with a Conceptual Hydrologic Model. 2. Applications and Results,
W81-01963 6A

Urban Water Supply -- A Statistical Survey,
W81-02054 5F

STATISTICAL MODELS
Comparison of Sprinkler Uniformity Models,
W81-02081 4B

STEENBRAS RESERVOIR
Steenbras Reservoir: Trout Plantings and Recoveries,
W81-02052 8I

STEENBRAS RESERVOIR SCHEME
A First in South Africa: The Steenbras Pumped Storage Scheme.
W81-02051 8C

STETTYNSKLOOF DAM
Raising Stettynskloof Dam.
W81-02062 8D

STOCHASTIC PROCESSES
Stochastic Approach to Waste Treatment Planning,
W81-02122 6A

STORAGE TANKS
Reservoir Coatings Can Support Bacterial Growth,
W81-02072 5F

STORM DRAINS
Methodology for 'Lumped' SWMM Modelling,
W81-01925 2E

Development of an Urban Highway Storm Drainage Model Based on SWMM,
W81-01927 8A

STORM RUNOFF
A Simplified Stormwater Quantity and Quality Model,
W81-01924 2E

Methodology for 'Lumped' SWMM Modelling,
W81-01925 2E

Characterization, Magnitude and Impact of Urban Runoff in the Grand River Basin,
W81-01926 5B

Development of an Urban Highway Storm Drainage Model Based on SWMM,
W81-01927 8A

Alternative Urban Flood Relief Measures; A Case Study; City of Regina, Saskatchewan, Canada,
W81-01931 4A

STORM SURGES
An Assessment of Storm Surge Modeling,
W81-01935 2L

STORM WATER
Combined Sewer System Analysis Using Storm and SWMM for the City of Cornwall,
W81-01922 5D

Considerations Regarding the Application of SCS TR-55 Procedures for Runoff Computations,
W81-01923 2E

Detention Lake Application in Master Drainage Planning,
W81-01930 4A

Political Aspects of Urban Stormwater Management,
W81-02118 2E

STRATIFICATION
Some Considerations on the Dense Population of a Purple Sulfur Bacterium, Chromatium Sp. at the Mid-Depth of Lake Kaiike,
W81-01977 2H

STREAM EROSION
Submerged Horizontal Jet over Erodible Bed,
W81-02079 2J

STREAM IMPROVEMENT
Impact of Stream Alterations on Riparian Communities in Southcentral Oklahoma,
W81-02025 6G

Effects of Stream Habitat Improvements on Invertebrates, Trout Populations, and Mink Activity,
W81-02091 8I

STREAMFLOW
Low-Flow Characteristics of Streams in the Upper Wisconsin River Basin, Wisconsin,
W81-02026 2E

Streamflow Characteristics of the Yellowstone River Basin, Montana, through 1976,
W81-02041 2E

STREAMFLOW FORECASTING
Real-Time Forecasting with a Conceptual Hydrologic Model. I. Analysis of Uncertainty,
W81-01962 6A

Real-Time Forecasting with a Conceptual Hydrologic Model. 2. Applications and Results,
W81-01963 6A

A Logical Approach to the Design Storm Concept,
W81-01971 6A

Low-Flow Characteristics of Streams in the Upper Wisconsin River Basin, Wisconsin,
W81-02026 2E

STRESS
Validity of Cubic Law for Fluid Flow in a Deformable Rock Fracture,
W81-01969 2F

SUBMERGED PLANTS
Responses of Submersed Vascular Plant Communities to Environmental Change,
W81-02013 5C

SUBSURFACE FLOW
A Mixed Numerical Analytical Method for Groundwater Flow Simulation,
W81-01966 2F

SUGAR CANE
Sediment Losses from Small Agricultural Watersheds in Hawaii (1972-77),
W81-01943 4D

SULFUR BACTERIA
Some Considerations on the Dense Population of a Purple Sulfur Bacterium, Chromatium Sp. at the Mid-Depth of Lake Kaiike,
W81-01977 2H

SUPPLEMENTAL IRRIGATION
Modeling Supplemental Irrigation Water Demand,
W81-02082 4B

SURFACE-GROUNDWATER RELATIONSHIPS
Groundwater Hydrology of the Sagebrush Flat Area and Possible Relations to the Discharge of Rattlesnake Springs, Grant and Douglas Counties, Washington,
W81-02032 2F

SURFACE WATERS
Water Resources Data for Florida, Water Year 1979--Volume 1. Northeast Florida,
W81-02029 7C

Hydrology of the Seldovia Area, Alaska,
W81-02037 2F

Hydrologic Data for Okaloosa, Walton, and Southeastern Santa Rosa Counties, Florida,
W81-02043 7C

Surface Water Inventory through Satellite Sensing,
W81-02115 7B

SURFACTANTS
An Automated Method for the Determination of Non-Ionic Surfactants in Water,
W81-01987 5A

SURVEYS
The Elements of Quality and Social Costs in Rural Water Supply and Utilization,
W81-01954 6D

Urban Water Supply -- A Statistical Survey,
W81-02054 5F

SWISHER COUNTY (TX)
Analytical Study of the Ogallala Aquifer in Swisher County, Texas, Projections of Saturated Thickness, Volume of Water in Storage, Pumpage Rates, Pumping Lifts, and Well Yields,
W81-02006 4B

SYNERGISTIC EFFECTS
Synergistic Effects of Phosphorus and Heavy Metal Loadings on Great Lakes Phytoplankton,
W81-01918 5C

SYNTHETIC ADSORBENTS
Modeling and Prediction of Specific Compound Adsorption by Activated Carbon and Synthetic Adsorbents,
W81-02136 5D

TANNERY WASTES
Tannery Waste Water Treatment by the Oxygen Activated Sludge Process,
W81-02111 5D

TEMPERATURE
Plant and Canopy Temperatures in Corn as Influenced by Differential Moisture Stress,
W81-01948 3F

TENNESSEE
Groundwater Availability in Carbonate Rocks of the Dandridge Area, Jefferson County, Tennessee,
W81-02034 2F

TERRACING
Soil Erosion by Water as Related to Management of Tillage and Surface Residues, Terracing, and Contouring in Eastern Oregon,
W81-01940 4D

TERTIARY TREATMENT
Advanced Waste Water Treatment Removes Nutrients without Chemicals,
W81-02132 5D

TETON DAM
Problems in Applying Optimal Irrigation Plans,
W81-02123 6E

TEXAS
Analytical Study of the Ogallala Aquifer in Sherman County, Texas, Projections of Saturated Thickness, Volume of Water in Storage, Pumpage Rates, Pumping Lifts, and Well Yields,
W81-02000 4B

Analytical Study of the Ogallala Aquifer in Moore County, Texas, Projections of Saturated Thickness, Volume of Water in Storage, Pumpage Rates, Pumping Lifts, and Well Yields,
W81-02001 4B

Analytical Study of the Ogallala Aquifer in Armstrong County, Texas, Projections of Saturated Thickness, Volume of Water in Storage, Pumpage Rates, Pumping Lifts, and Well Yields,
W81-02002 4B

Occurrence and Quality of Groundwater in the Edwards-Trinity (Plateau) Aquifer in the Trans-Pecos Region of Texas,
W81-02003 4B

Records of Wells, Water Levels, Pumpage, and Chemical Analyses of Water from the Carrizo Aquifer in the Winter Garden Area, Texas, 1970 through 1977,
W81-02004 4B

Analytical Study of the Ogallala Aquifer in Randall County, Texas, Projections of Saturated Thickness, Volume of Water in Storage, Pumpage Rates, Pumping Lifts, and Well Yields,
W81-02005 4B

Analytical Study of the Ogallala Aquifer in Swisher County, Texas, Projections of Saturated Thickness, Volume of Water in Storage, Pumpage Rates, Pumping Lifts, and Well Yields,
W81-02006 4B

Land-Surface Subsidence in the Texas Coastal Region,
W81-02031 2F

Detention Storage for Urban Flood Control,
W81-02117 2E

THAMES RIVER
Factors Influencing the Formation of Haloforms in the Chlorination of Humic Materials,
W81-02143 5B

THEORETICAL ANALYSIS
A Simplified Functions Approach for Determining Soil Hydraulic Conductivities and Water Characteristics In Situ,
W81-01999 2G

THERMAL POLLUTION
Temperature; Water Quality Standards; Criteria Digest; A Compilation of State/Federal Criteria.
W81-02021 5G

TIDAL EFFECTS
Mathematical Modeling of Circulation in Baker Bay, Washington/Oregon,
W81-02010 2L

TOKYO
Mathematical Model for Improving Combined Sewer Systems,
W81-02104 4A

Development of Sewer Systems and Treatment Plants in Tokyo,
W81-02107 5D

TOXICITY
Theoretical Aspects of the 'Normalcy and Pathology' Problem in Aquatic Ecotoxicology,
W81-01908 5C

Trends in Aquatic Toxicology in the United States: A Perspective,
W81-01909 5C

Comparison of Principles of Development and Use of Water Quality Standards in the USSR and USA,
W81-01910 5C

Chlorinated Hydrocarbons as a Limiting Factor in the Reproduction of Lake Trout in Lake Michigan,
W81-01911 5C

Organophosphorus Pesticides and Their Hazards to Aquatic Animals,
W81-01912 5C

Some Factors Affecting the Toxicity of Ammonia to Fishes,

SELECTED WATER RESOURCES ABSTRACTS

VOLUME 14, NUMBER 12
JUNE 15, 1981

W81-02151 -- W81-02400
CODEN: SWRABW

SELECTED WATER RESOURCES ABSTRACTS (SWRA) is produced by the Office of Water Research and Technology, U.S. Department of the Interior, and published twice monthly by the National Technical Information Service (NTIS), U.S. Department of Commerce.

SWRA is available to Federal agencies and their contractors or grantees in water resources research upon request, citing contract or grant number and sponsoring agency. Write: Office of Water Research and Technology, U.S. Department of the Interior, Washington, DC 20240. The **SWRA Journal** is also available on subscription from NTIS, 5285 Port Royal Road, Springfield, VA 22161. Annual subscription rates for the North American Continent are: Journal only, $100; Journal and Annual Indexes, $125; Indexes only, $50.Other addressees, write for prices.

Some documents abstracted in this journal can be purchased from NTIS. Price codes are given in the entries and a current code-price conversion table is printed on the outside back cover. Other documents are available from originating organizations or authors as indicated in the citation.

SELECTED WATER RESOURCES ABSTRACTS

A semimonthly publication of the Office of Water Research and Technology,
U.S. Department of the Interior

VOLUME 14, NUMBER 12
JUNE 15, 1981

W81-02151 -- W81-02400

The Secretary of the Interior has determined that the publication of the periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1983.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

PREFACE

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. These documents cover water resources as treated in the life, physical, and social sciences and the related engineering and legal aspects of the characteristics, supply condition, conservation, control, use, or management of water resources. Each abstract includes a full bibliographic citation and a set of descriptors which are listed in the **Water Resources Thesaurus.** The abstract entries are classified into 10 fields and 60 groups similar to the water resources research categories established by the Committee on Water Resources Research of the then Federal Council for Science and Technology.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several services of the Office of Water Research and Technology. The cumlative SWRA file from 1968 and monthly updates are available also in magnetic tape through lease from NTIS.

THE OFFICE OF WATER RESEARCH AND TECHNOLOGY DOES NOT PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Comments and suggestions concerning the contents and arrangement of this bulletin are welcome.

Washington, D.C. 20240

CONTENTS

SUBJECT FIELDS AND GROUPS

Please use the edge index on the back cover to locate Subject Fields and Indexes.

01 NATURE OF WATER

Includes the following Groups: Properties; Aqueous Solutions and Suspensions.

02 WATER CYCLE

Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION

Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL

Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Nonwater Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION

Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING

Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA

Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS

Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES

Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION

Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

SELECTED WATER RESOURCES ABSTRACTS

1. NATURE OF WATER

1A. Properties

GEOTHERMAL RESOURCES IN THE BANBURY HOT SPRINGS AREA, TWIN FALLS COUNTY, IDAHO,
Geological Survey, Boise, ID. Water Resources Div.
R. E. Lewis, and H. W. Young.
Available from the OFSS, USGS Box 25425, Fed. Ctr., Denver, CO 80225, Price: $5.75 in paper copy, $4.50 in microfiche. Geological Survey Open-File Report 80-563 (WRI), August, 1980. 35 p, 11 Fig, 5 Tab, 21 Ref.

Descriptors: *Geothermal studies, *Thermal springs, *Water temperature, *Water analysis, *Idaho, Water utilization, Water wells, Water level fluctuations, Water chemistry, Stable isotopes, Radioisotopes, Heat balance, *Banbury Hot Springs(ID).

Thermal water (30.0 to 72.0 degrees Celsius) is produced from 26 wells and 2 springs in the vicinity of Banbury Hot Springs near Buhl, Idaho. Thermal water is used for space heating of private residences, catfish and tropical fish production, greenhouse operation, swimming pools, and therapeutic baths. In 1979, 10,300 acre-feet of thermal water was utilized; heat discharged convectively from the geothermal system was about 1.09 x 10 to the 7th power calories per second. Decline in artesian head and discharge apparent in recorder charts from two wells may represent seasonal fluctuations or may reflect aquifer response to development of the resource. Thermal waters sampled are sodium bicarbonate in character and slightly alkaline. Mixing of a hot (72 degrees Celsius) water with local, cooler ground water can be shown from various relations between stable isotopes, chloride, and enthalpy. On the basis of concentration of trituim, age of the waters sampled is at least 100 years an perhaps more than 1,000 years. One water (33 degress Celsius) may be as young as 29 years. On the basis of silica, sodium-potassium-calcium, and sulfate-water geothermometers, best estimate of the maximum reservoir temperature for the thermal waters is between about 70 and 100 degrees Celsius. (USGS)
W81-02367

2. WATER CYCLE

2D. Evaporation and Transpiration

BARREN AREA EVAPOTRANSPIRATION ESTIMATES GENERATED FROM ENERGY BUDGET MEASUREMENTS IN THE GILA RIVER VALLEY OF ARIZONA,
Geological Survey, NSTL Station, MS. Water Resources Div.
O. E. Leppanen.
Available from the OFSS, USGS Box 25425, Fed. Ctr., Denver, CO 80225, Price: $4.50 in paper copy, $3.50 in microfiche. Geological Survey Open-File Report 80-1003, 1980. 31 p, 6 Fig, 2 Tab.

Descriptors: *Evapotranspiration, *Heat balance, *Energy budget, *Arizona, Land Cleaning, Evaluation, Micrometeorology, Evaporation, Transpiration, Rainfall, Soil moisture, Bermudagrass, Phreatophytes, Gila River valley(AZ), *Gila River Phreatophyte Project.

Estimates of evapotranspiration for 479 successive days were created by using energy budget measurements. The measurement point was on the 2-kilometer wide flood plain of the Gila River in east-central Arizona, about 18 kilometers above Coolidge Dam. The flood plain had been cleared of all tall vegetation for distances of about 20 kilometers upstream and 5 kilometers downstream from the measurement site. Chaining, raking, and burning had been used to clear the area immediately surrounding the measurement site about 6 months before measurements began. Ground cover was sparse volunteer Bermudagrass and scattered seepwillow for a distance of at least 1 kilometer in all directions from the measurement point . The water table was deep, so most of the evaporated water came from rainfall, but some came from soil moisture deeper than 2 meters. The March to March water loss (evapotranspiration less rain) was about 47 millimeters, evapotranspiration demand was 377 millimeters. Daily rates varied from very small amounts of condensation to almost 5 millimeters of evapotranspiration. (USGS)

2E. Streamflow and Runoff

RUNOFF CALCULATION ON SEMI-ARID WATERSHEDS USING A ROTADISK RAINULATOR,
Arizona Water Resources Research Center, Tucson.
J. Morin, and C. B. Cluff.
Water Resources Research, Vol 16, No 6, p 1085-1093, December, 1980. 6 Fig, 4 Tab, 16 Ref. OWRT-B-015-ARIZ(4), 14-01-0001-1425.

Descriptors: *Runoff forecasting, *Rainfall-runoff relationships, *Arid lands, Infiltration, Watersheds(Basins), Mathematical models, Model studies, Forecasting, Hydrology, Atterbury watershed, Demonstration watersheds, Depth-area curves, Rainfall simulators, Semiarid climates, Southwest U.S., Rainfall, Soil surfaces, Soil moisture, Tucson, *Arizona.

Storm runoff depth from ungaged semi-arid watersheds was predicted by measuring infiltration rate with a rotating disk rainfall simulator and combining this information with data from recording raingages using a modified Horton-type equation. The method was tested on the Atterbury Experimental Watershed east of Tucson, Arizona. The good correlation between calculated and measured runoff values supports the thesis that surface crusting is the controlling factor in these watersheds. Standard deviation of the differences were 1-3 mm over a 3 year period. Maximum, average, and minimum infiltration curves were developed. Best correlation between measured and calculated values was obtained with the average curve. Maximum curves are useful in designing flood control projects, while minimum curves are valuable in planning water supply systems. (Cassar-FRC)

ESTIMATION OF SMALL-WATERSHED PEAK FLOWS IN CHINA,
Academia Sinica, Beijing (China). Inst. of Geography.
C. M. Liu, and G. Wang.
Water Resources Research, Vol 16, No 5, p 881-886, October, 1980. 1 Fig, 5 Tab, 6 Ref.

Descriptors: *Peak discharge, *Model studies, *China, Storm runoff, Watersheds(Basins), Flood peak, Runoff, *Streamflow forecasting, Channel flow, Flow, Overland flow, Surface runoff, Rainfall, Flood forecasting, Forecasting.

A model for predicting the flood peak discharge from storm rainfall in streams in small watersheds was developed from data measured on experimental watersheds and from physical geographical parameters such as soil type and terrain condition. Peak discharge in large basins is different from that in small basins. Differences in flow caused by physical factors (vegetation, soil type, slope, geology, location, drainage net, etc.) are much more pronounced in small basins, whereas in larger basins these effects tend to be averaged throughout the several tributaries. Comparison of estimated versus observed peak discharges in 16 locations in China showed average relative errors between 6.8 and 23.1%. The method has been successfully used to provide information for railroad and hydraulic engineering design in several regions of China. (Cassar-FRC)
W81-02208

COMPARATIVE STUDY OF PHYSICAL-CHEMICAL VARIABLES OF STREAMS USING MULTIVARIATE ANALYSES,
Battelle Pacific Northwest Labs., Richland, WA. Ecosystems Dept.
C. E. Cushing, C. D. McIntire, J. R. Sedell, K. W. Cummins, and G. W. Minshall.
Archiv fur Hydrobiologie, Vol 89, No 3, p 343-352, July, 1980. 2 Fig, 2 Tab, 12 Ref.

Descriptors: *Stream classification, *Running waters, Rivers, Base flow, Phosphorus compounds, Nitrates, Watersheds(Basins), Precipitation(Atmospheric), Channels, Variability, Solar radiation, Gradient(Streams).

Twenty-nine streams (34 sampling sites) in North America and Europe were categorized using 15 physical-chemical variables into 5 meaningful clusters, (ARID, ROCK, OREG, EAST, and WOOD) in an attempt to provide a classification scheme for streams similar to the oligotrophy-eutrophy systems for lakes. ARID sites have high solar radiation, low precipitation, high phosphorus content, large drainage basins, and low ratios of channel length to watershed area. ROCK sites share some of the above characteristics but have greater winter and summer base flows and precipitation, and lower phosphorus content. OREG are similar to ROCK but have greater precipitation and a larger ratio of channel length to watershed area. Solar radiation is somewhat less, and nitrates are low. EAST and WOOD share small watershed areas, low insolation, high terrestrial litter input, and intermediate precipitation. However, WOOD has higher winter and summer base flow and nitrate contents, and EAST has steeper gradients and larger ratios of channel length to watershed areas. Further evaluation of the physical-chemical variables is desirable, and a study of biological variables is essential. (Cassar-FRC)

FLOOD DEPTH-FREQUENCY RELATIONS FOR LOUISIANA,
Geological Survey, Baton Rouge, LA. Water Resources Div.
A. S. Lowe.
Louisiana Department of Transportation and Development, Office of Public Works Water Resources Technical Report No 23, 1980. 14 p, 1 Plate, 1 Tab, 7 Ref.

Descriptors: *Flood forecasting, *Peak discharge, Water depth, *Regional analysis, *Louisiana, *Flood plains, Flood recurrence interval, Streamflow, Stream gages, Analytical techniques, Probability, Flood profiles, Hydrologic data.

Flood damage resulting from development of flood plains in Louisiana has caused considerable economical losses in recent years. Regional relations are defined for estimating the heights of floods having recurrence intervals of 25, 50, and 100 years for natural streams in Louisiana. Contributing drainage area is the only independent variable required for estimating flood heights for natural streams. The only limitations are that the streams be unregulated, that the contributing drainage area be in the range of values used to derive the relations, and that the equations be used on streams some distance upstream from their confluence. Data on flood heights for 191 gaging stations are given. (USGS)

LOW-FLOW CHARACTERISTICS OF STREAMS IN THE ST. CROIX RIVER BASIN, WISCONSIN,
Geological Survey, Madison, WI. Water Resources Div.
B. K. Holmstrom.
Available from the OFSS, USGS Box 25425, Fed. Ctr., Denver, CO 80225, Price: $10.75 in paper copy, $4.50 in microfiche. Geological Survey Open-File Report 80-696 (WRI), August, 1980. 62 p, 6 Fig, 3 Tab, 14 Ref.

Descriptors: *Low flow, *Streamflow, Low-flow frequency, *Streamflow forecasting, *Regression

analysis, Equations, Base flow, Evaluation, Flow characteristics, Flow duration, Flow rates, Wisconsin, *St. Croix River basin(WI).

Low-flow characteristics of streams in the St. Croix River basin, Wisconsin, are presented. Included are estimates of low-flow frequency and flow duration at 7 gaging stations, low-flow frequency characteristics at 23 low-flow partial-record stations and 78 miscellaneous sites, and a list of base-flow discharge measurements at 29 miscellaneous sites. Equations are provided to estimate low-flow characteristics at ungaged sites and at sites where one base-flow discharge measurement is available. The equations were determined from multiple-regression analyses that related low-flow characteristics at gaging stations and low-flow partial-record stations to basin characteristics. The standard error of estimate is provided for each method of estimating the annual minimum 7-day mean flow below which the flow will fall on the average of once in 2 years and once in 10 years. Standard error provides the user with the expected degree of accuracy for each method. (USGS)
W81-02368

LOW-FLOW CHARACTERISTICS OF STREAMS IN THE MENOMINEE-OCONTO-PESHTIGO RIVER BASIN, WISCONSIN,
Geological Survey, Madison, WI. Water Resources Div.
B. K. Holmstrom.
Available from the OFSS, USGS Box 25425, Fed. Ctr., Denver, CO 80225, Price: $11.50 in paper copy, $4.50 in microfiche. Geological Survey Open-File Report 80-749 (WRI), August, 1980. 82 p, 6 Fig, 2 Plates, 3 Tab, 18 Ref.

Descriptors: *Low flow, *Streamflow, Low-flow frequency, *Streamflow forecasting, *Regression analysis, Equations, Base flow, Evaluation flow characteristics, Flow duration, Flow rates, Wisconsin, *Menominee-Oconto-Peshtigo River basin(WI).

Low-flow characteristics of streams in the Menominee-Oconto-Peshtigo River basin, Wisconsin, are presented. Included are estimates of low-flow frequency at 12 gaging stations, flow duration at 10 gaging stations, and low-flow frequency characteristics at 23 low-flow partial-record stations and 137 miscellaneous sites. Equations are provided to estimate low-flow characteristics at ungaged sites and at sites where one base-flow discharge measurement is available. The equations were determined from multiple-regression analyses that related low-flow characteristics at gaging stations and low-flow partial-record stations to basin characteristics. The standard error of estimate is provided for each method of estimating the annual minimum 7-day mean flow below which the flow will fall on the average of once in 2 years and once in 10 years. The standard error of estimate for the 7-day 10-year low flow ranged from 6% to 76% depending on the type of data available. Standard error provides the user with the expected degree of accuracy for each method. (USGS)

FLOOD OF FEBRUARY 20, 1979, IN HILO, KAU, AND PUNA DISTRICTS, ISLAND OF HAWAII,
Geological Survey, Portland, OR. Water Resources Div.
D. D. Harris, and R. H. Nakahara.
Hawaii Division of Water and Land Development, Honolulu Circular C 81, March, 1980. 28 p, 14 Fig, 3 Tab, 6 Ref.

Descriptors: *Floods, Flash floods, Storms, *Storm runoff, *Hawaii, *Peak discharge, Flood damage, Flood stages, Flood discharge, Flood data, Hilo(HI), Kau(HI), Puna(HI).

The storm of February 18-20, 1979, produced extreme amounts of rainfall, which caused much flooding all along the lowlands of the eastern and southeastern coasts of the island of Hawaii. The most notable flooding occurred in the North and South Hilo Districts. Flooding throughout the Hilo District was the result of sheet runoff from the torrential rain. Throughout the city of Hilo, many homes and business establishments were flooded. In the Kau District, the greatest flooding occurred near Pahala. As in the Hilo area, much of the flooding resulted from sheet runoff. Because of the extreme road overflow, much of the Kau District was cut off from the rest of the island during the height of the flood. Flooding in the Puna District did not seem to be quite as severe as in the Hilo District, although numerous roads were closed for periods of time. On February 24, 1979, Governor Ariyoshi designated the Hilo, Kau, and Puna Districts as major disaster areas; on March 7, 1979, President Carter declared the island of Hawaii a major disaster area. 2F. Groundwater

IS TRANSPORT IN POROUS MEDIA ALWAYS DIFFUSIVE. A COUNTEREXAMPLE,
Ecole Nationale Superieure des Mines de Paris, Fontainbleau (France).
G. Matheron, and G. De Marsily
Water Resources Research, Vol 16, No 5, p 901-917, October, 1980. 9 Fig, 2 Tab, 21 Ref

Descriptors: *Solutes, *Groundwater movement, *Porous media, Fickian diffusion, Laplaces equation, Diffusion, Aquifers, Hydrologic properties, Diffusivity, Permeability.

Solute transport cannot generally be represented by the usual Fickian convection-diffusion equation in the special case of a stratified porous medium with flow parallel to the bedding. This is relevant for flow in certain types of fractured rocks where parallel fractures may allow the propagation of dissolved species without considerable lateral mixing if the general flow is parallel to the fractures. When the flow is not exactly parallel to the stratification, diffusive behavior is more likely to appear, but the time or length of displacement needed to obtain asymptotic behavior may be too large for application to real-life situations. Further work on the mechanism of transport in porous media is necessary. (Cassar-FRC)

CHEMICAL AND PHYSICAL CHARACTERISTICS OF NATURAL GROUNDWATERS IN MICHIGAN: A PRELIMINARY REPORT,
Geological Survey, Lansing, MI. Water Resources Div.
T. R. Cummings.
Available from the OFSS, USGS Box 25425, Fed. Ctr., Denver, CO 80225, Price: $4.75 in paper copy, $3.50 in microfiche. Geological Survey Open-File Report 80-953, August, 1980. 34 p, 12 Fig, 5 Tab, 13 Ref.

Descriptors: *Groundwater, Geochemistry, Water quality, *Water properties, *Michigan, Hydrogeology, Dissolved solids, *Chemical analysis, *Water analysis, Water types.

Wide variations occur in the chemical and physical characteristics of natural groundwaters in Michigan. Dissolved-solids concentrations range from 23 to 2,100 milligrams per liter. Waters having low dissolved-solids concentrations are calcium bicarbonate waters. Sodium, sulfate, and chloride increase as mineralization increases. Iron, aluminum, and titanium are higher at some locations than is common in most natural waters. Lead concentrations exceed those desirable in drinking water at some locations in the northern part of the Lower Peninsula. Generalized areal patterns of water quality variation suggest that geology is a primary cause of differences across the State. Examples of chemical associations in water suggest that chemical analyses may be valuable in tracing and identifying mineral deposits. (USGS)

ANNUAL WATER-RESOURCES REVIEW, WHITE SANDS MISSILE RANGE, NEW MEXICO, 1979,
Geological Survey, Albuquerque, NM. Water Resources Div.
R. R. Cruz
Available from the OFSS, USGS Box 25425, Fed. Ctr., Denver, CO 80225, Price: $3.50 in paper copy, $3.50 in microfiche. Geological Survey Open-File Report 80-753, May, 1980. 25 p, 11 Fig, 5 Tab, 3 Ref

Descriptors: *Groundwater resources, *Water wells, *Pumping, *Water yield, *Water quality, Water level fluctuations, Potentiometric level, Water analysis, Chemical analysis, Observation wells, Boreholes, Aquifer management, Hydrologic data, Military reservations, New Mexico, *White Sands Missile Range(NM)

Ground-water data were collected in 1979 at White Sands Missile Range in south-central New Mexico. Total ground-water pumpage from the Post Headquarters well field, which produces more than 98% of the water used at White Sands Missile Range, was 1.4 million gallons more in 1979 than in 1978. The most significant seasonal water-level declines observed in 1979 were in supply well 22 (36.35 feet) and test well T-7 (15.98 feet). The chemical quality of water samples collected in 1979 was similar to that collected at comparable depths and periods in 1978. (USGS)

HYDROGEOLOGY OF THE TOWN OF NORTH HEMPSTEAD, NASSAU COUNTY, LONG ISLAND, NEW YORK,
Geological Survey, Syosset, NY. Water Resources Div.
C. Kilburn.
Nassau County Department of Public Works, Long Island Water Resources Bulletin 12, 1979. 87 p, 15 Fig, 36 Ref, 4 Plates

Descriptors: *Hydrogeology, *Aquifers, Aquifer systems, *Geologic formations, Aquifer characteristics, Aquicludes, Water levels, Well data, Hydrologic data, Maps, New York, *Long Island(NY), Town of North Hempstead(NY).

The groundwater reservoir underlying the Town of North Hempstead, Long Island, N.Y., is composed of unconsolidated glacial and interglacial deposits of Pleistocene age and terrestrial coastal-plain deposits of Late Cretaceous age that are underlain by bedrock of possible Cambrian-Ordovician age. The bedrock surface forms the base of the groundwater reservoir. The Cretaceous deposits consist of three hydrogeologic units, which are, from oldest to youngest, the Lloyd aquifer and Raritan clay, both of the Raritan Formation, and

the Magothy aquifer, which belongs to the Magothy Formation-Matawan Group, undifferentiated. In the northern parts of Great Neck and Manhasset Neck, the Cretaceous deposits are extensively eroded, and materials of Pleistocene age have been deposited adjacent to and upon them as well as upon the bedrock. The Cretaceous, Pleistocene and Holocene( ) deposits in these areas form two hydrogeologic units herein named the Port Washington aquifer and the Port Washington confining unit. Glacial deposits of late Pleistocene age and local deposits of Holocene age form the upper glacial aquifer. These undifferentiated deposits overlie the older deposits and abut them locally in buried valleys. The principal aquifers underlying the Town of North Hempstead are the Lloyd, Magothy, and Port Washington aquifers. (USGS)

CAPE CODE AQUIFER, CAPE COD, MASSACHUSETTS,
Geological Survey, Boston, MA. Water Resources Div.
B. J. Ryan.
Geological Survey Water-Resources Investigations 80-571, August, 1980. 23 p, 8 Fig, 5 Tab, 49 Ref, 3 Plates.

Descriptors: *Aquifers, *Groundwater, Aquifer characteristics, *Water quality, *Massachusetts, Water wells, Water table, Withdrawals, Pumping, Natural recharge, Municipal water, *Water pollution sources, Chemical analysis, Saline water-freshwater interfaces, *Cape Cod(MA), Cape Cod aquifer(MA).

Groundwater was the major source of drinking water on Cape Cod, Mass., in 1978. Withdrawals from over 100 municipal wells averaged 17.5 million gallons per day in 1978. Private wells on Cape Cod are estimated to number 15,000. Groundwater occurs primarily under unconfined or water-table conditions. Artesian conditions exist where fine silt and clay beds have been deposited along Cape Cod's north shore from Bourne to Brewster, locally along the south shore, and in parts of Chatham and Orleans. Natural recharge to the aquifer is entirely from precipitation. Discharge is by pumping; evapotranspiration; direct evaportion from the water table; and seepage to rivers, marshes, and the ocean. Groundwater quality is generally suitable for domestic uses, although some public and private water wells have been contaminated. Contaminants can enter the groundwater by infiltration from land surface, ponds, streams, and swamps. Infiltration from sewage lagoons, sand filter beds, septic tanks, cesspools, recharge pits, wells, or intrusion of saline water may also contaminate the aquifer. Alternative sources of drinking water, including desalination, transport from the mainland, and rainwater cisterns are many time more expensive. (USGS)

GROUNDWATER QUALITY IN NORTH IDAHO,
Geological Survey, Boise, ID. Water Resources Div.
D. J. Parliman, H. R. Seitz, and M. L. Jones.
Available from the OFSS, USGS Box 25425, Fed. Ctr., Denver, CO 80225. Price: $5.00 in paper copy, $3.50 in microfiche. Geological Survey Open-File Report 80-596 (WRI), July, 1980. 34 p, 8 Fig, 4 Tab, 20 Ref, 2 Plates.

Descriptors: *Water quality, *Groundwater, *Water chemistry, *Idaho, Baseline studies, Hydrogeology, Water treatment, Aquifers, Water wells, Sampling, Groundwater recharge, Water table, Groundwater movement, Water analysis, Chemical analysis, Dissolved solids, Nitrates, Iron, Trace elements, Hardness(Water).

From July 1977 to May 1978, water samples were collected from 116 wells north of the Palouse River in Idaho to define water-quality conditions, on a reconnaissance level, in major aquifers. Geologic and hydrologic data were combined with water-quality data to develop an understanding of factors affecting present and future groundwater quality. Samples were analyzed for 16 major chemical constituents, selected metallic trace elements, pH, specific conductance, water temperature, and total- and fecal-coliform bacteria. Locally, concentrations of dissolved solids, nitrite plus nitrate, iron, and cadmium exceeded mandatory or recommended limits established for public water supplies. Hardness exceeding 300 milligrams per liter may restrict groundwater use esthetically or economically. Groundwater quality is adequate and quantity is sufficient to meet population and economic demands as of 1978. (USGS)

GROUNDWATER AVAILABILITY AND SURFICIAL GEOLOGY OF THE ROYAL, UPPER PRESUMPSCOT, AND UPPER SACO RIVER BASINS, MAINE,
Geological Survey, Augusta, ME. Water Resources Div.
G. C. Prescott, Jr.
Geological Open-File Report 70-1287 (WRI), April, 1980. 4 Fig, 13 Ref, 3 Sheets.

Descriptors: *Groundwater availability, *Geology, Groundwater, *Groundwater resources, *Maine, Hydrogeology, Glacial drift, Aquifers, Aquifer characteristics, Water wells, Water yield, Water quality, Saco River basin(ME), Presumpscot River basin(ME), Royal River basin(ME).

The report describes the surficial geology and groundwater resources of parts of the Saco, Presumpscot, and Royal River basins, in Maine. Principal aquifers are the stratified glacial deposits of sand and gravel and the sandy alluvium of the Old Course Saco River north of Fryeburg. Under most favorable conditions, as much as 1,000 gal/min of water can be obtained from wells in the stratified glacial deposits. The bedrock yields water to many wells, but the median yield is only 5 gal/min. Water from unconsolidated deposits is generally of good chemical quality except in local areas where iron and manganese problems exist or the wells have been subject to contamination. Water from bedrock is more variable in character than water from unconsolidated deposits but is normally of good quality except where contaminated or where it contains iron and manganese concentrations in excess of U.S. Environmental Protection Agency standards. Water from granite and pegmatite bedrock has been reported to contain radon gas in excess of U.S. Environmental Protection Agency standards, but the epidemiological significance, if any, for the residents of southwestern Maine is not presently known. (USGS)

GROUNDWATER-LEVEL MONITORING FOR EARTHQUAKE PREDICTION--A PROGRESS REPORT BASED ON DATA COLLECTED IN SOUTHERN CALIFORNIA, 1976-79,
Geological Survey, Menlo Park, CA. Water Resources Div.
W. R. Moyle, Jr.
Available from the OFSS, USGS Box 25425, Fed. Ctr., Denver, CO 80225, Price: $10.00 in paper copy, $4.00 in microfiche. Geological Survey Open-File Report 80-413, June, 1980. 60 p, 23 Fig, 4 Tab, 9 Ref.

Descriptors: *Groundwater, *Water level fluctuations, *Forecasting, *Earthquakes, *California, Data collections, Water wells, Well data, Analytical techniques, Aquifer systems, Seismic studies, Atmospheric pressure, Water temperature, Water quality, Southern California uplift, Earth tides.

The U.S. Geological Survey is conducting a research program to determine if groundwater-level measurements can be used for earthquake prediction. Earlier studies suggest that water levels in wells may be responsive to small strains on the order of 10 to the minus 8th power to 10 to the minus 10th power (dimensionless). Water-level data being collected in the area of the southern California uplift show response to earthquakes and other natural and manmade effects. The data are presently (1979) being made ready for computer analysis. The completed analysis may indicate the presence of precursory earthquake information. (USGS)

SALINE WATER AT THE BASE OF THE GLACIAL-OUTWASH AQUIFER NEAR VINCENNES, KNOX COUNTY, INDIANA,
Geological Survey, Indianapolis, IN. Water Resources Div.
R. J. Shedlock.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-118614, Price codes: A04 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 80-65, August, 1980. 54 p, 27 Fig, 7 Tab, 18 Ref.

Descriptors: *Saline water, *Groundwater, *Aquifers, *Water supply, *Indiana, Aquifer characteristics, Fractures(Geologic), Glacial drift, Groundwater movement, Saline water-intrusion, Surface-groundwater relationships, Model studies, Hydraulic conductivity, Sandstones, *Knox County(IN), Wabash River valley(IN).

A plume of saline water at the base of the glacial outwash aquifer near Vincennes, Indiana, has been drawn into the municipal well field. However, the average chloride concentration of the municipal water, 30 + or - 5 milligrams per liter, did not change significantly from 1976 to 1979. The plume, and elongated lens approximately 6,500 feet long by 1,500 feet wide, is 4 feet thick near the well field, and the chloride concentration of the water is 3,500 milligrams per liter. Half a mile to the west the thickness is 18 feet, and the chloride concentration is 5,100 milligrams per liter. The saline water seems to be entering the outwash aquifer through bedrock fractures near abandoned oil wells west of the well field. The fractures probably intersect unplugged intervals of the abandoned oil wells that convey saline water from bedrock aquifers at unknown depths. Digital model analysis indicates that doubling the 1978 pumping rate in the well field would cause water-levels declines of generally less than 8 feet. Solute-transport model analyses indicate that the chloride concentration of the well-field water would be less than 250 milligrams per liter for a saline-water intrusion rate ten times the model-calibrated rate. (USGS)

AQUIFER TESTS IN THE GALLUP SANDSTONE NEAR YAH-TA-HEY, NEW MEXICO,
Geological Survey, Albuquerque, NM. Water Resources Div.
J. S. McLean.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-103590,

Price codes: A03 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 80-25, February, 1980. 25 p, 14 Fig, 1 Tab, 9 Ref.

Descriptors: *Aquifer testing, *Transmissivity, *Storage coefficient, *Hydraulic conductivity, *New Mexico, Aquifer characteristics, Well data, Model studies, Simulation analysis, Observation wells, Pumping, Drawdown, Leakage, *Gallup Sandstone(NM).

Aquifer tests of the Gallup Sandstone and associated units in the Yah-ta-hey well field in New Mexico have yielded values of transmissivity ranging from 250 to 400 feet squared per day and values of storage coefficient ranging from 0.00005 to 0.0001. A 2 1/2-month aquifer test was conducted in the spring of 1976 to provide data to better refine these values. The results of the long-term aquifer test were simulated in a digital model. A transmissivity of 300 feet squared per day, storage coefficient of 0.0001, and vertical hydraulic conductivity of the overlying Crevasse Canyon Formation of less than 0.0001 feet per day gave the best fit of simulated to observed drawdown in the pumped well and the two observation wells. (USGS)
W81-02397

GEOHYDROLOGY AND DIGITAL-SIMULATION MODEL OF THE FARRINGTON AQUIFER IN THE NORTHERN COASTAL PLAIN OF NEW JERSEY,
Geological Survey, Trenton, NJ. Water Resources Div.
G. M. Farlekas.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-123002. Price codes: A04 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 79-106, August, 1979. 55 p, 23 Fig, 1 Tab, 38 Ref.

Descriptors: *Model studies, *Aquifers, *Hydrogeology, *Coastal Plains, *New Jersey, Aquifer characteristics, Groundwater, Hydraulic conductivity, Water levels, Withdrawal, Inflow, Groundwater recharge, Aquitards, Northern Coastal Plain(NJ), Farrington aquifer.

A digital computer model was developed to simulate the Farrington aquifer in the Northern Coastal Plain of New Jersey. The aquifer, consisting mainly of the Farrington Sand Member of the Raritan Formation, is mostly sand with some gravel. The thickness of the aquifer ranges from a featheredge about 170 feet. Calibration of the model was achieved by comparing the observed potentiometric surface of November 1973 with the model computed potentiometric surface at the end of the 15-year simulation period. Hydrographs were also compared with model hydrographs. The calibration was made by matching the calculated head changes with observed head changes under a known stress during the 15-year period. Steady-state runs were made after the model was calibrated. Water levels determined by steady-state runs compared favorably with limited prepumping water-level data. Potentiometric surfaces for 1985 and 2000 computed on a projection of groundwater withdrawals for the period 1959-73 are similar to the November 1973 surface but are deeper. The cone of depression in the vicinity of Sayreville was projected by the model to be in excess of 100 feet below mean sea level by 1985 and exceeds 150 feet below mean sea level by 2000. Groundwater budget analyses for steady state and transient conditions for the entire study area and for several rectangular subareas yielded reasonable values of groundwater inflow and discharge. (USGS)

GROUNDWATER IN THE PIEDMONT UPLAND OF CENTRAL MARYLAND,
Geological Survey, Towson, MD. Water Resources Div.
C. A. Richardson.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-113813. Price codes: A03 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 80-18, March, 1980. 42 p, 7 Fig, 7 Tab, 28 Ref.

Descriptors: *Groundwater, *Aquifers, *Groundwater availability, *Hydrogeology, *Maryland, Aquifer characteristics, Water sources, Water table, Water wells, Water yield, Water quality, Water utilization, Water supply, Maryland Piedmont.

Aquifers in a 130-square-mile area of the central Maryland and Piedmont, are shown to be the sole or principal source of water. The study area is underlain chiefly by crystalline rocks and partly by unaltered sandstones and siltstones. The groundwater is derived from local precipitation and generally occurs under water-table conditions. Its movement is restricted by the lack of interconnected openings, and most groundwater occurs within 300 feet of the land surface. Hydrographs indicate no long-term change in groundwater storage. A few wells yield more than 100 gallons per minute, but about 70% of 286 inventoried wells yield 10 gallons per minute or less; most specific capacities are less than 1.0 gallon per minute per foot. The groundwater quality is generally satisfactory without treatment and there are no known widespread pollution problems. Estimated daily figures on groundwater use are as follows; 780,000 gallons for domestic purposes; 55,000 for commercial purposes; and 160,000 for public supply. Although part of the area is served by an existing surface-water supply and could be served by possible extension of those and other public-supply water mains, much of the rural population is dependent on the groundwater available from private wells tapping the single aquifer that underlies any given location. Neither the groundwater conditions nor this dependence on individual wells is unique to the study area, but, rather, applies to the entire Piedmont province. (USGS)

2G. Water In Soils

ESTIMATING CRITICAL STRESS IN UNSATURATED SOILS FROM CHANGES IN PORE WATER PRESSURE DURING CONFINED COMPRESSION,
Science and Education Administration, St. Paul, MN.
W. E. Larson, and S. C. Gupta.
Soil Science Society of American Journal, Vol 44, No 6, p 1127-1132, November/December, 1980. 8 Fig, 1 Tab, 12 Ref

Descriptors: *Stress, *Soil physical properties, *Pore pressure, Soil compaction, Compressibility, Compacted soils, Pressure, Soil structure, Soil moisture, Mathematical studies.

When unsaturated agricultural soils are compressed by vehicular traffic, cultivation, or other mechanical stress, changes in structure and pore water pressure occur. This paper describes the changes in pore water pressure as a function of initial soil water content and applied stress. As unsaturated soils are compressed, pore water pressure decreases to a minimum and then increases. Curves obtained from plotting pore water pressure and log applied stress for a given soil with different water contents are similar in shape, but vary in scale. The degree of water saturation at which mimimum pore water pressure occurs is constant for a given soil. As clay content increases to 33%, the degree of saturation increases to 0.60 and remains constant. As applied stress increases beyond the point of minimum pore water pressure, soil aggregates are degraded. The maximum pressure a soil can withstand without damage to its aggregate structure corresponds with the point of minimum pore water pressure during compression. A procedure for estimating the critical stress for soils based on their clay content is developed. (Cassar-FRC)

SIMPLE METHOD FOR PREDICTING DRAINAGE FROM FIELD PLOTS,
Rockwell International, Richland, WA.
J. B. Sisson, A. H. Ferguson, and M. T. van Genuchten.
Soil Science Society of America Journal, Vol 44, No 6, p 1147-1152, November/December, 1980. 6 Fig, 4 Tab, 14 Ref.

Descriptors: *Drainage, *Hydraulic conductivity, *Infiltration, Subsurface waters, Conductivity, Groundwater movement, Seepage, Saline water intrusion, *Soil water movement, Forecasting, Numerical analysis, Equations.

The unit gradient method was used in the one-dimensional moisture flow equation to predict long-term drainage from soils. Three published hydraulic conductivity relationships (Watson, Davidson et al., and Brooks and Corey) were used to generate three analytical solutions for the drainage phase following infiltration. When log total water above a depth was plotted against log time, nearly straight lines were obtained. Two examples were given to show the accuracy of the method. The first compared the unit gradient method with a numerical solution of the complete flow equation. The second example applied the method to a field problem, drainage from a Gerber silty clay loam, typical of soils on which saline seeps occur. Both examples showed acceptable correlation. PHYTOPLANKTON FROM SWEDISH LAKES. III. LAKE HUNDSJON AND OTHER KETTLE LAKES OF CENTRAL SWEDEN,
National Swedish Environment Protection Board, Uppsala. Water Quality Lab.
T. Willen.
Archiv fur Hydrobiologie, Vol 89, No 1/2, p 135-159, June, 1980. 7 Fig, 1 Tab, 30 Ref.

Descriptors: *Lakes, *Phytoplankton, *Nutrients, Algae, Water quality, *Sweden, Eutrophication, Limnology, Aquatic plants, Aquatic algae, Conductivity, Lime, Acidic water.

Five small kettle lakes in Sweden were studied during 1964-1975. Lakes Hundsjon and Kattlammen, both with extremely low conductivity, high Secchi disc transparencies, low pH (4.9-6.5) and moderate nutrient concentrations, are located in a densely populated area. Plant life in Hundsjon included an abundance of moss, Drepanocladus polycarpus, on the bottom. Sometimes abundant desmids were present in the moss carpet. Macrophytes were sparse. Peridinium willei was dominant at times. Other frequently occurring algae were Botyrococcus, Dictyosphaerium, Oocystis, Staurodesmus, Stichococcus, and Chrysophyceans. Lake Kattlammen experienced a large development of Dinobryon spp., Dictyosphaerium elegans, Gloeotila curta and Peridinium inconspicuum before a lime treatment program was carried out in 1973-1974. Afterwards, these taxa were replaced by unstable and mixed populations of phytoplankton. The other three lakes were richer in nutrients, had higher conductivities, and had blooms of Anabaena, Gomphosphaeria, and Microcystis. All of the 5 lakes contained low numbers of diatoms. It is suggested that these lakes be preserved for study because of their unusual characteritics and their proximity to Stockholm and Uppsala. (Cassar-FRC)

SIGNIFICANCE OF ALGAL EXTRACELLULAR PRODUCTS TO BACTERIA IN LAKES AND IN CULTURES,
Toronto Univ. (Ontario). Div. of Life Sciences.
C. Nalewajko, K. Lee, and P. Fay.
Microbial Ecology, Vol 6, No 3, p199-207, 1980. 4 Fig, 24 Ref.

Descriptors: *Bacteria, *Algae, *Lakes, Cultures, Lake Erie, Jack's Lake, Chlorella, Pseudomonads, Phytoplankton, Eutrophication, Diurnal, Glycolates, Limnology, Aquatic algae, Microbiology, Aquatic environment, Photosynthesis, Nutrients, Ecology, Symbiosis, Mesotrophic lakes, Eutrophic lakes, Ontario.

The relationship of bacterial growth to algal excreta (predominantly glycolate) was studied in the laboratory, in Jack's Lake (mesotrophic), and in Lake Erie (eutrophic). During a simulated diurnal laboratory experiment using Chlorella pyrenoidosa and Pseudomonas fluorescens, bacterial growth occurred in the daylight at the expense of glycolate. Mixed bacterial-algal cultures had lower glycolate levels and lower dissolved organic compounds than axenic Chlorella cultures. In both cultures glycolic acid and extracellular products decreased at night. When Lake Erie water was enriched with phytoplankton particles greater than 30 micrometers in size, 1,009 mg per cu meter algae were produced, compared with that in unenriched lakewater, 764 mg per cu meter algae. Total algal biomass was increased 32% by enrichment, but photosynthesis increased by only 17%. Daytime extracellular carbon release was 0.48 micrograms per hour in enriched water; 0.4 in natural water. In natural lake water bacterial counts increased equally, night and day. In the enriched systems numbers increased rapidly during the day and little during the dark. In enriched Jack's Lake water, photosynthesis was 32% higher and algal biomass 99.8% higher than in unenriched water. Daytime carbon excretion rates were 0.55 and 0.76 micrograms per liter in natural and enriched samples, respectively. thus bacterial growth can depend upon algal photosynthesis and extracellular release. DIFFERENTIAL FILTRATION STUDIES OF CARBON FLUX FROM LIVING ALGAE TO MICROHETEROTROPHS, MICROPLANKTON SIZE DISTRIBUTION AND RESPIRATION IN LAKE KINNERET,
Kinneret Limnological Lab., Tiberias (Israel).
T. Berman, and C. Gerber.
Microbial Ecology, Vol 6, No 3, p 189-198, 1980. 4 Tab, 42 Ref.

Descriptors: *Bacteria, *Algae, *Organic matter, Respiration, Limnology, Aquatic microorganisms, Lake Kinneret, *Israel, Carbon radioisotopes, Photosynthesis, Filtration, Eutrophication.

The transfer of photosynthetically fixed, dissolved organic carbon from living algae to heterotrophic bacteria was not extensive, according to differential filtration studies (3 and 0.4 micrometers) conducted with surface water samples from the eutrophic Lake Kinneret, Israel. Samples were incubated with C14-bicarbonate for 3 hours in the light followed by 21 hours of darkness. Only 10% of the carbon fixed in the light was associated with particulate matter less than 3 micrometers in size. There was no significant decrease in the relative proportion of carbon taken up by larger (greater than 3 micrometers) organisms after the dark period. Respiration rates ranged from 3.4 to 21.2% of daylight net photosynthesis. Apparent residence time for glucose was 20-168 hours and, for amino acids, 20-152 hours. Most of the substrates for microbial heterotrophs were derived from detrital breakdown or animal excretions. (Cassar-FRC)

IN SITU MEASUREMENT OF THE SETTLING VELOCITY OF ORGANIC CARBON PARTICLES AND 10 SPECIES OF PHYTOPLANKTON,
Canada Centre for Inland Waters, Burlington (Ontario).
N. M. Burns, and R. Rosa.
Limnology and Oceanography, Vol 25, No 5, p 855-864, September, 1980. 3 Fig, 3 Tab, 23 Ref.

Descriptors: *Phytoplankton, *Settling velocity, *Diurnal distribution, Organic carbon, Vertical migration, Eutrophication, Diatoms, Algae, Particle size, *Lake St. George, Ontario, Deposition(Sediments), Aquatic life, Zooplankton, Migration patterns.

Settling velocities of ten species of phytoplankton and three sizes of particulate organic carbon (POC) were measured in Lake St. George, a small eutrophic lake in Ontario. The three sizes of POC had similar fluxes. Settling velocities were 0.24 meters per day, 1-10 microns; 1.54 meters per day, 10-64 microns; and 2.32 meters per day, greater than 64 microns. There was little variation during the 24 hour period except for a slight increase in settling velocity and flux during the sunset period, perhaps due to fecal pellets from upward migration and increased grazing of zooplankton. Average settling velocities for the ten phytoplankton species varied from 0.08 + or - 0.11 to 0.32 + or - 0.32 meters per day. The species of phytoplankton varied in their response to light intensity. The flagellates migrated downward at sunset; a diatom species had a smaller settling velocity during daylight than at night; a blue-green alga showed maximum buoyance at midnight; and some green species moved downward on a bright day and upward on a dull day. Phytoplankton carbon fluxes were less than 1% of the total downward flux. (Cassar-FRC)

ROLE OF BENTHIC ALGAE IN TRANSPORT OF NITROGEN FROM SEDIMENT TO LAKE WATER IN A SHALLOW CLEARWATER LAKE,
Uppsala Univ. (Sweden). Inst. of Linmology.
M. Jansson.
Archiv fur Hydrobiologie, Vol 89, No 1/2, p 101-109, June, 1980. 1 Fig, 2 Tab, 13 Ref.

Descriptors: *Nitrogen compounds, *Sediment-water interfaces, *Lake sediments, Benthic flora, Ammonium compounds, Oligotrophy, Lakes, Limnology, Lake Stugsjon, *Sweden, Aquatic algae, Laboratory studies.

The oligotrophic Lake Stugsjon, Sweden, showed large increases in dissolved inorganic nitrogen during July and August each year. To test the hypothesis that the benthic algae assimilated inorganic N and released organic N by excretion and/or degradation, N15 labelled ammonium ion was added to sediment and N15 distribution followed. Three core samples were incubated for 3 days: one exposed to light, one in darkness, and one exposed to light and treated with HgCl2 to inhibit biological activity. In the light-exposed tube, a large amount of N15 was found in the benthic algae, little or none in the interstitial water. No unlabelled ammonium was detected. In the dark tube, N15 was rather uniformly distributed among the compartments analyzed, and the benthic algae incorporated only 20% as much N15 as did the algae in the light tube. Inorganic N15 appeared in the water above the core. In the biologically inhibited sediment and water, algae did not incorporate any N15 from ammonium. No dissolved organic N was found in the water. In all tubes, sediment adsorbed the major part of the added ammonium. These experimental findings were consistent with the theory that benthic algae removed ammonium from the interstitial water and prevented the flux of ammonium from the sediment to the lake water. SPECTRAL ABSORPTION PROPERTIES OF NATURAL WATERS: CONTRIBUTION OF THE SOLUBLE AND PARTICULATE FRACTIONS TO LIGHT ABSORPTION IN SOME INLAND WATERS OF SOUTH-EASTERN AUSTRALIA,
Commonwealth Scientific and Industrial Research Organization, Canberra (Australia). Div. of Plant Industry.
J. T. O. Kirk.
Australian Journal of Marine and Freshwater Research, Vol 31, No 3, p 287-296, June, 1980. 1 Fig, 1 Tab, 15 Ref.

Descriptors: *Light penetration, *Absorption, *Phytoplankton, Tripton, Australia, Attenuation, Surface waters, Turbidity, Suspended solids, Gilvin, Color, Spectrometry.

Light in natural waters is absorbed by 4 components: the water, dissolved yellow coloring (gilvin), phytoplankton, and non-living particulate matter (tripton). This paper presents a method developed for measuring the absorption spectra and for calculating the in situ absorption coefficients of the plankton/tripton fraction, for which little data exists. Absorption coefficients have been used to calculate how much photosynthetically active radiation (PAR) is captured by the components. In clear, colored water, gilvin absorbs the most PAR, followed by water. In water containing a high level of phytoplankton, gilvin absorbs the most, followed by the particulate fraction and water. Tripton absorbs the most in highly turbid waters and is the most important light scatterer. (Cassar-FRC)

Species composition and abundance of zooplankton (predominantly microcrustaceans) and phytoplankton (algae, diatoms, and cryptophytes) varied diurnally in the area of a macrophyte stand in Lake Paajarvi, an ologotrophic brown-water lake. At night, in the shallow zones, algae decreased and microcrustaceans (Bosmina dominated) increased, possibly as a result of wind-induced water movement and zooplankton grazing. The Bosmina appeared to avoid water with high pH. Values for pH and oxygen saturation reflected the diurnal fluctuations. Diatoms and green algae dominated the littoral plankton in the innermost section of the macrophyte stand, cryptophytes in the outer areas. Eutrophic desmids were found in the innermost parts of the littoral area, where daytime pH could rise above 9. The upper limit for oligotrophic algae is 8.6-8.85. In the pelagial area, pH remained near 7. At the outer parts of the macrophyte stand water moved between littoral and pelagial zones, and algae populations were mixed. (Cassar-FRC)

ANAEROBIC METABOLISM OF PARTICULATE ORGANIC MATTER IN THE SEDIMENTS OF A HYPEREUTROPHIC LAKE,
Michigan State Univ., Hickory Corners. W. K. Kellogg Biological Station.
J. J. Molongoski, and M. J. Klug.
Freshwater Biology, Vol 10, No 6, p 507-518, December, 1980. 8 Fig, 1 Tab, 34 Ref.

Descriptors: *Eutrophication, *Anaerobic conditions, *Organic matter, Methane, Decomposing organic matter, *Lake sediments, Fermentation, Phytoplankton, Algae, Lakes, Sedimentation, Ammonia, Aquatic microorganisms, Hydrogen sulfide, Nitrates, Sulfates, Lake Wintergreen, Michigan, Surface waters, Hypolimnion, Shallow water, Seston.

The extent and mechanisms of anaerobic decomposition of particulate organic matter in the sediment of the shallow hypereutrophic lake, Wintergreen Lake, Michigan, were studied in 1976 and 1977. Most of the decomposition occurred through fermentation and methanogenesis, and was related to the rate of organic loading. During 1976 methane formation was inhibited after excessive organic deposition. Nitrate and sulfate were absent. Two to three weeks after large inputs of organic matter to the sediments, increased production of ammonia, hydrogen sulfide, volatile fatty acids, and methane were seen. Maximum concentrations of most metabolites were found at the sediment-water interface where initial degradation took place. Total methane production during the summer stratification was 34% of the particulate organic input in 1976 and 44% in 1977. (Cassar-FRC)

QUANTIFICATION AND CHARACTERIZATION OF SEDIMENTING PARTICULATE ORGANIC MATTER IN A SHALLOW HYPEREUTROPHIC LAKE,
Michigan State Univ., Hickory Corners. W. K. Kellogg Biological Station.
J. J. Molongoski, and M. J. Klug.
Freshwater Biology, Vol 10, No 6, p 497-506, December, 1980. 7 Fig, 1 Tab, 19 Ref.

Descriptors: *Eutrophication, *Phytoplankton, *Lakes, Algae, Sedimentation, Organic matter, Seston, Lake sediments, Suspended solids, Shallow water, Proteins, Hypolimnion, Photic zone, *Wintergreen Lake, Michigan, Surface waters, Limnology, Aquatic microorganisms.

Wintergreen Lake, Michigan, a shallow (maximum depth 6.5 meters) hypereutrophic lake, was studied from May to November in 1976 and 1977 to determine the quantity and quality of particulate organic matter reaching the sediments. In 1976 the sedimentation rate (in grams per sq meter per day) of the total seston was 2.7 to 19.3, while organic seston was 1.2 to 8.3. In 1977 these rates were 2.6-9.5 and 1.5-3.5 respectively. Sedimentation rates were lowest in spring, with peaks in October-November and variable rates during the summer. The amount of organic matter reaching the sediments was closely tied to the productivity of the phytoplankton, with sedimentation lagging about 1-3 weeks behind phytoplankton activity. The anaerobic hypolimnion was close to the photic zone. The sediment was high in organic content, particularly protein, but low in cellulose components. Many intact algal cells were identified, indicating that little decomposition of the algae took place during the short sedimentation distance. (Cassar-FRC)

VERTICAL MIGRATIONS OF ZOOPLANKTON IN THE ARCTIC: A TEST OF THE ENVIRONMENTAL CONTROLS,
New Hampshire Univ., Durham. Dept. of Zoology.
C. Buchanan, and J. F. Haney.
In: Evolution and Ecology of Zooplankton Communities, W. Charles Kerfoot, editor. University Press of New England, 1980, p 69-79. 8 Fig, 1 Tab, 41 Ref. OWRT-A-044-NH(3), 14-31-0001-5029.

Descriptors: *Vertical migration, *Zooplankton, *Diel migration, *Arctic, *Environmental controls, Migration, Environmental effects, Light intensity, Lakes, Ponds, Diel vertical migration.

Diel vertical migration studies of several zooplankton species were done in the arctic in experimental columns and in situ under a range of light cycles, including continuous sunlight. Populations did not migrate under continuous light in midsummer, but began to migrate when photoperiods shifted to <20h. The migrations occurred when the relative rate of change in light intensity was most rapid around sunset and sunrise. A diel cycle of unoriented swimming activity was observed under all light cycles in some of the species investigated. The 24-h-day depth of a population could be altered by temperature, food concentration, age, and diel cycles of activity. The association of zooplankton behavior with morphological and physiological features is discussed in terms of the selective forces for vertical migration.

LIMNOLOGICAL DATA FOR 12 RESERVOIRS IN VALLEY COUNTY, MONTANA,
Geological Survey, Helena, MT. Water Resources Div.
R. F. Ferreira.
Available from the OFSS, USGS Box 25425, Fed. Ctr., Denver, CO 80225, Price: $9.00 in paper copy, $3.50 in microfiche. Geological Survey Open-File Report 80-339, March, 1980. 68 p, 1 Fig, 5 Tab, 6 Ref.

Descriptors: *Limnology, *Reservoirs, *Water quality, *Water utilization, *Montana, Water properties, Dissolved solids, Nutrients, Trace elements, Sediment control, Multiple-purpose reservoirs, Northeastern Montana, *Valley County(MT).

Water samples were collected from 12 reservoirs in northeastern Montana during the late winter, spring, summer, and early fall of 1978. The resulting physical and chemical water-quality data will be useful in managing the reservoirs for use of stock watering, waterfowl propagation, fish production, and recreation. The surface areas of the reservoirs range for 0.4 to 28.1 hectares with water depths ranging from 0.25 to 6.9 meters. The chemical composition of water varied among reservoirs and with season. Specific conductance ranged from 446 to 4,020 micromhos per centimeter during the winter sampling period and from 62 to 999 micromhos per centimeter during the spring sampling period. Although a pH of 6.9 was measured at one reservoir during the winter, pH values generally ranged from 7.7 to 9.8. Under ice cover, which averaged 1.0 meter thick in late February, three reservoirs attained dissolved-oxygen concentrations above saturation. Each reservoir can be classified as having one of the following three water types: sodium bicarbonate, sodium sulfate, or calcium sodium bicarbonate. (USGS)
W81-02351

WATER BUDGET AND WATER-SURFACE FLUCTUATIONS, GREAT SALT LAKE, UTAH,
Geological Survey, Salt Lake City, UT. Water Resources Div.
T. Arnow.
Geological Survey Open-File Report 78-912, 1978. 21 p, 9 Fig, 1 Tab, 7 Ref.

Descriptors: *Hydrologic budget, *Water level fluctuations, *Great Salt Lake, *Utah, Lake stages, Inflow, Discharge(Water), Consumptive use, Saline water.

The water-budget equation for Great Salt Lakes is: Inflow = Outflow + or - Storage change. The average annual inflow for the period 1931-76 was about 2.9 million acre-feet; 1.9 million acre-feet from surface sources, about 900,000 acre-feet from direct precipitation, and about 75,000 acre-feet from ground water. The average annual outflow for the same period, all be evaportion, also was about 2.9 million acre-feet. Storage changes are computed on the basis of changes in the surface level of the lake. During the period of historic record, 1847-1978, the lake surface has fluctuated within a range of about 20 feet but has shown little overall change. The lake surface would have been about 5 feet higher in 1978 than it was in 1947 had there been no consumptive use of water caused by man's activities in the lake basin. Since 1959 the lake has been divided into two parts by a railroad causeway, which has restricted the natural circulation. This has resulted in a difference of salinity and of surface level across the causeway. The difference in surface level between the two parts of the lake varies seasonally and annually and has been as much as 2.35 feet. (USGS)

WATER-QUALITY CHARACTERISTICS OF SELECTED LAKES AND RESERVOIRS IN COLORADO,
Geological Survey, Lakewood, CO. Water Resources Div.
L. J. Britton, and D. A. Wentz.
Available from the OFSS, USGS Box 25425, Fed. Ctr., Denver, CO 80225, Price: $18.50 in paper copy, $3.50 in microfiche. Geological Survey Open-File Report 80-436, (WRI), 1980. 139 p, 2 Fig, 1 Tab, 29 Ref.

Descriptors: *Water quality, *Lakes, *Reservoirs, *Limnology, *Colorado, Eutrophication, Water analysis, Data collections.

During the summers and autumns of 1973, 1974, and 1975, water-quality data were collected and compiled for 56 lakes and reservoirs in Colorado. The lakes and reservoirs sampled range from large reservoirs in the eastern part of the State to smaller natural lakes in the higher western parts of the Colorado Plateaus. The smallest body of water sampled was Anderson Reservoir No. 1 with a surface area of 47 acres in Mesa County, and the largest was Najajo Reservoir with a surface area of

15,600 acres in Archuleta County. The report includes physical, chemical, and biological water-quality data collected as a part of each lake or reservoir reconnaissance. Also included are data on drainage area, water-surface altitude, surface area,depth, storage capacity, and principal uses, obtained from various governmental agencies or the owner or regulating agency of each lake or reservoir. A subjective evaluation of the trophic (enrichment) state is presented based on nutrient and phytoplankton concentrations and the dissolved-oxygen distribution. In addition, a numerical trophic-state index, based on Secchi-disk transparency (a measure of light penetration) is reported, to show trophic comparisons between lakes and reservoirs. (USGS)

WATER QUALITY OF FOUR LAKES IN LAKEVILLE, MINNESOTA,
Geological Survey, St. Paul, MN. Water Resources Div.
L. H. Tornes, and M. R. Have.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-119943, Price codes: A04 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 80-66, July, 1980. 51 p, 23 Fig, 4 Tab, 21 Ref.

Descriptors: *Lakes, *Water quality, *Limnology, *Minnesota, Eutrophication, Phytoplankton, Aquatic algae, Nutrients, Water analysis, Chemical properties, Physical properties, Biological properties, Bottom sampling, Dakota County(MN), Lakeville(MN).

Water-quality characteristics were determined for four lakes (Marion, Orchard, Kingsley, and Lee) in Lakeville, Minn., to provide background data and evaluate changes in lake water quality that may occur with urbanization. Thirteen samplings were done from March 1976 to October 1978. Physical characteristics of the lakes were defined and selected chemical and biological constituents were determined. Calcium carbonate precipitation is suggested by pH values as high as 10 near the surface and a decreases in the calcium concentration when magnesium, sodium, and chloride concentrations increase. Pollution of part of Marion Lake is indicated by chloride concentrations that increased from 18 to 57 milligrams per liter between June and October 1978. The eutrophic state of the lakes is suggested by supersaturated dissolved oxygen near the surface and dissolved-oxygen concentrations less than 0.1 milligram per liter near the deepest parts of the lakes in summer. Total phosphorus and chlorophyll a concentrations and Secchi-disk transparencies were used to determine the trophic state of the lakes. Trophic state indices were as high as 69.2. Phosphorus concentrations were significantly higher in Lee and Kingsley Lakes than in the other lakes sampled. Anacystis and Oscillatoria were the dominant phytoplankton genera. Phytoplankton blooms occurred throughout the year with the highest sampled concentration yielding 890,000 cells per milliliter during September 1976 in Lee Lake. (USGS)

2I. Water In Plants

DEPENDENCE OF DIOSCOREA TUBER GROWTH RATE ON WATER CONTENT OF AN ANDEPT SOIL,
New Jersey Agricultural Experiment Station, New Brunswick.
R. F. Dawson, J. E. Shrum, Jr., and R. A. Mohammed.
Soil Science Society of America Journal, Vol 44, No 6, p 1298-1302, November/December, 1980. 2 Fig, 2 Tab, 14 Ref.

Descriptors: *Plant growth, *Soil water, *Irrigation effects, *Water requirements, Crop production, Dioscorea, Planting management, Andept soil, Volcanic soil, Soil types, Aeolian soils, Crop response, Irrigation efficiency, Consumptive use, *Soil-water-plant relationships.

Dioscorea, a pharmaceutical crop from which is extracted a raw material used in cortisone manufacture, was grown on an experimental plantation in young volcanic soils in Central America. After several other crop management variables had been eliminated as factors in the poor crop production (less than 50% of projected), soil water content was studied. Stomatal activity as measured by leaf diffusion resistance increased with increase in soil water content. Thus, the highest rates of photosynthate deposited in the tubers resulted from the highest, but least efficient, rates of water consumption. The light, free-flowing Andept soils limited tuber growth rate by an inability to supply low-tension water uninterrupted. Tuber growth rate was 1.22 grams per week per gram of water (near maximum) at the highest water efficiency, 1.67 grams per liter. A proper soil for this crop represents a porous topsoil over a permanent water table or percolation barrier, suggesting that some fluvial andept soils be investigated. (Cassar-FRC)

STOCHASTIC ESTIMATION OF BED LOAD YIELD IN POOL-AND-RIFFLE MOUNTAIN STREAMS,
Ministry of Works and Development, Christchurch (New Zealand). Water and Soil Div.
G. A. Griffiths.
Water Resources Research, Vol 16, No 5, p 931-937, October, 1980. 3 Fig, 3 Tab, 30 Ref.

Descriptors: *Stochastic processes, *Sediment transport, *Bed load, *Streams, Running waters, Sediment load, Hydrology, New Zealand, Model studies, Sediment yield, Mathematical models, Streambeds, Banks, Synthetic hydrology, Floods.

A stochastic model is developed to estimate bed load yield in pool-and-riffle mountain streams as additional information for design of flood control structures, debris retention dams, and bridges, as well as for studies of erosion rates and geomorphic processes. In mountain streams, water-borne sediment generally is derived from landslides, stream bank collapses, and other random mass movements. This characteristic produces different bed load yields from similar floods. Flood-produced sediment is stored in pools and moved gradually by lesser flows. Expected bed load yield in a given basin is predicted through the convolution of a Poisson number of events with an exponential probability of bed load yield. The exponential distribution is determined from flood frequency, an empirical bed load transport formula, and flow records from a similar, near-by basin. (Cassar-FRC)

EVALUATION OF SELECTED PROCESSES CONTROLLING NITROGEN LOSS IN A FLOODED SOIL,
Florida Univ., Sanford. Agricultural Research and Education Center.
K. R. Reddy, W. H. Patrick, Jr., and R. E. Phillips.
Soil Science Society of America Journal, Vol 44, No 6, p 1241-1246, November/December, 1980. 5 Fig, 7 Tab, 33 Ref.

Descriptors: *Saturated soils, *Nitrogen compounds, *Diffusion, Nitrates, Ammonium compounds, Nutrient removal, Nitrogen cycle, Denitrification, Nitrification, Ammonification, Gases, Chemical reactions, Soil water, Aerobic conditions, Anaerobic conditions, Oxidation, Reduction(Chemical), *Nitrogen loss control.

Nitrogen loss from continuously flooded soils was studied in fine silty soils. Major processes controlling nitrogen loss, which function simultaneously and continuously in flooded soils and lake bottoms, are ammonium-nitrogen diffusion, ammonium-nitrogen oxidation, nitrate-nitrogen diffusion, and nitrate-nitrogen reduction. The respective rates of these processes were 0.059 to 0.216 sq cm per day, 1.2 to 3.5 micrograms per gram per day, 0.96 to 1.94 sq cm per day, and 0.315 to 0.520 micrograms per gram per day, with half lives ranging from 1.3 to 2.2 days. Calculations to compensate for the differences in units indicated that the slow rates of ammonium diffusion from the anaerobic soil layer to the aerobic soil layer and the ammonium oxidation in the aerobic soil layer are limiting factors in controlling nitrogen loss. Conversely, the more rapid nitrate diffusion into the anaerobic soil layer and nitrate reduction in the anaerobic soil layer are not limiting factors in nitrogen loss. (Cassar-FRC)

GRANULOMETRIC DEPENDENCE OF CHROMIUM ACCUMULATION IN ESTUARINE SEDIMENTS IN MAINE,
Maine Univ. at Orono, Walpole. Dept. of Oceanography.
L. M. Mayer, and L. K. Fink, Jr.
Estuarine and Coastal Marine Science, Vol 11, No 5, p 491-503, November, 1980. 10 Fig, 1 Tab, 30 Ref. OWRT-B-016-ME(3).

Descriptors: *Sediments, *Chromium, *Estuaries, Nutrients, Water pollution sources, Minerals, *Maine, Granules, Particle size, Fluctuations, Trace elements, Intertidal areas.

The distributions of chromium pollutants in four estuaries in Maine were examined by studying variations of chromium concentrations with grain size in estuarine sediments. An indicator of sediment texture was devised, based on the sediment specific surface area, which has been shown to be superior to measurements of the proportion of fine-grained sediment for detecting regional fluctuations in chromium concentration with sediment texture. The main control on chromium levels in the four systems studied was mineralogy. A textural normalization technique was applied, which employed specific surface areas in estuaries receiving a chromium-rich effluent to differentiate pure from polluted sediments. Effluent chromium accumulates within the estuary rather than in adjacent coastal

sediments, with chromium concentration occurring in intertidal zones instead of subtidal areas. (Geiger-FRC)

ECOLOGICAL STUDIES OF THE KELP, LAMINARIA HYPERBOREA, AND ITS ASSOCIATED FAUNA IN SOUTHWEST IRELAND,
Cambridge Univ. (England). Zoological Lab.
A. Edwards.
Ophelia, Vol 19, No 1, p 47-60, May, 1980. 6 Fig, 3 Tab, 36 Ref.

Descriptors: *Bioindicators, *Kelps, *Turbidity, Aquatic life, Estuaries, Sediments, Pollutant identification, Bantry Bay, *Ireland, Suspension, Speciation, Aquatic animals, Laminaria hyperborea.

It has been suggested that the performance of a holdfast kelp, Laminaria hyperborea, and the suspension-feeding fauna associated with it were an indication of water pollution. This study shows that natural increases in turbidity may also affect this system. The fauna associated with the kelp in bays and rivers in southwest Ireland were counted and classified. Water at Eagle Point and the Boar in Bantry Bay was very turbid, but pollution sources were minimal. Nevertheless, the fauna had low species diversity and were dominated by suspension feeders, notably Pomatoceros triqueter. Other sites in the bay had more diverse fauna, fewer suspension feeders, and more omnivores and carnivores. Kelp mass decreased with increasing depth at sites with greater turbidity. The maximum depth of kelp growth was greatest near the sea and decreased as the head of the bay was approached, where sediment deposits, and sediment-rich freshwater was present. (Cassar-FRC)

STUDIES OF SALINITY STRATIFICATION IN SOUTHERN LAKE PONTCHARTRAIN NEAR THE INNER HARBOR NAVIGATION CANAL,
New Orleans Univ., LA. Dept. of Biological Sciences.
M. A. Poirrier.
The Proceedings of the Louisiana Academy of Sciences, Vol XLI, p 26-35, December, 1978. 5 Fig, 7 Ref. OWRT-A-041-LA(3).

Descriptors: *Lake Pontchartrain, Physiochemical properties, Chemical analysis, Bioindicators, Invertebrates, Pollutant identification, Water quality, *Estuarine environment, *Estuaries, Saline water-freshwater interfaces, *Salinity, *Stratification, Seasonal, Mixing, *Louisiana.

Stratification was studied at 12 stations located within 10 km of the Inner Harbor Navigation Canal in Southern Lake Pontchartrain, La. Surface and bottom measurements of salinity, temperature and dissolved oxygen were made monthly from July 1976 through June 1977. Salinity stratification occurred in late spring, summer and fall and mixing occurred in winter. Stratification decreased with distance from the canal, and low bottom dissolved xoygen concentrations were found at stratified stations.

THE SALINITY EFFECTS OF DEEPENING THE DREDGED CHANNELS IN THE CHESAPEAKE BAY,
Institute for Water Resources (Army), Fort Belvoir, VA.
D. F. Bastian.
Report NWS-81-S1, December, 1980. 13 p, 6 Fig. Technical Paper presented at Ninth World Dredging Conference, 29-31 October 1980.

Descriptors: *Chesapeake Bay, *Estuaries, *Salinity, *Channel improvement, *Dredging, Channels, Model studies, Channel flow, Hydraulic models, Tidal effects, Mixing, Sediments, Tidal effects.

Tests on the Chesapeake Bay Model, the world's largest estuarine model, were used to assess the effects of increasing the approach channels to Baltimore, Maryland from 13 to 15 m. There are four sections of dredged channels comprising 55 km of the 277 km distance from the bay mouth to Baltimore. The increased depth of channel would extend the length of dredged channels to 79 km. Base tests using the existing 13-m channels were conducted to determine the synoptic velocity, salinity, and tidal conditions at a number of locations throughout the bay, but primarily in the dredged channels. A 2-1/2 year hydrographic period was simulated in the model to enhance the evaluation by adding a variable discharge as a parameter. A 12 constituent harmonic tide was used, giving a 28 lunar day tidal sequence which simulating a lunar month. The entire test was repeated, but with the 15-m channel installed. The tide is far more significant than discharge in affecting the velocities for the stations observed. No shift in flow predominance was identified between base and plan which could be used for conclusions about the effects of depth change on sediment transport. The deepened plan depths appear to induce higher salinities in the Patapsco and surrounding bay area. Salinity differences, base to plan, in this area attenuate with distance from the deepened channels. The model appears to be more saline during the plan test than the base test. (Moore-SRC)

Available from the OFSS, USGS Box 25425, Fed. Ctr., Denver, CO 80225, Price: $3.50 in paper copy, $3.50 in microfiche. Geological Survey Open-File Report 80-1021, 1980. 25 p, 10 Fig, 4 Ref.

Descriptors: *Estuaries, *Dredging, *Tidal effects, *Model studies, *Florida, Water circulation, *Hillsborough Bay(FL).

The effect of channel dredging and island construction on tidal flow and circulation in Hillsborough Bay, Fla., due to the Tampa Harbor Deepening Project is being investigated using a two-dimensional, finite-difference numerical model. Preliminary model results are presented as a series of maps showing tidal flood, tidal ebb, and circulation patterns in the bay for predredging and postdredging conditions. Complex circulation patterns occur near the bay mouth in an area where there is (1) a change in thalweg alinement of the bay, (2) an intersection of three major ship channels, and (3) submergent and emergent dredged material located adjacent to each of the channels. MULTIPLE OBJECTIVES IN RESERVOIR OPERATION,
Oklahoma Univ., Norman. School of Civil Engineering and Environmental Science.
G. W. Tauxe, D. M. Mades, and R. R. Inman.
Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers, Vol 106, No WR1, p 225-238, March, 1980. 3 Fig, 2 Tab, 19 Ref. OWRT-B-105-ILL(5).

Descriptors: *Reservoir evaporation, *Reservoir operation, *Reservoir releases, Water management(Applied), Mathematical models, Optimization, Dynamic programming.

A mathematical model is developed for determining reservoir release policies that maximize cumulative dump energy and minimize cumulative evaporation. Multi-Objective Dynamic Programming (MODP) is used as a technique to analyze objectives which may not be handled as easily or accurately with other optimization methods. The major advantages of this technique are that noncommensurable objective functions can be handled quantitatively, and that trade-off ratios are available between all objectives. Computational feasibility and tractability have been proven, and since the requirement of a single objective function has been eleminated, systems modelling is promoted, as is the capacity for thinking in terms of multiple objectives. As an illustration of MODP, the operation of Shasta Reservoir in California was examined, considering these two objectives. (1) To maximize the cumulation of dump energy generated above a prescribed level of firm energy, and (2) to minimize the cumulative evaporative loss. (Small-FRC)

SEWAGE SLUDGE AND CARROT WASTES AS SUPPLEMENTARY FEED FOR THE COMMON CARP CYPRINUS CARPIO,
Hong Kong Univ. Dept. of Biology.
M. H. Wong, and S. P. Cheung
Environmental Pollution, Series A: Ecological and Biological, Vol 23, No 1, p 29-39, September, 1980. 6 Fig, 5 Tab, 9 Ref.

Descriptors: *Recycling, *Sludge disposal, Carrots, Carp, Waste disposal, Fish, Nutrients, *Fish food, *Supplementary fish food.

Various amounts of digested sludge or carrot wastes from production of carrot juice were mixed with a control diet and fed to Cyprinus carpio to investigate whether these wastes could be used as supplementary fish feed and to establish appropriate concentrations of these wastes for culturing this economically important species. The six groups receiving the experimental diet were fed the following percentages: 30% carrot waste and 70% control diet; 50% carrot waste and 50% control diet; 80% carrot waste and 20% control diet; 30% sludge and 70% control diet; 50% sludge and 50% control diet; and 80% sludge and 20% control diet. Carp reared on 50% carrot waste were similar to carp fed with control diets exclusively. Carp receiving sludge-supplemented feeds demonstrated adverse effects, including changes in protein and carbohydrate contents of the fish. A high level of various metals was found in the sludge-supplemented diets. It was concluded that carrot wastes, but not sludge, have potential for use as fish food. (Baker-FRC)

DEFICIT, HIGH-FREQUENCY IRRIGATION OF SUGARBEETS WITH THE LINE SOURCE TECHNIQUE,
Science and Education Administration, Prosser, WA. Agricultural Research.
D. E. Miller, and A. N. Hang.
Soil Science Society of America Journal, Vol 44, No 6, p 1295-1298, November-December, 1980. 5 Fig, 9 Ref.

Descriptors: *Evapotranspiration, *Irrigation efficiency, *Sugar beets, Sprinkler irrigation, Line source technique, Deficit irrigation, Soil-water-

plant relationships, Crop production, Crop response, Loam, Sand, Pervious soils, Soil types, Plant growth, Water conservation.

Deficit, high frequency (daily) sprinkler irrigation using the line source technique did not decrease sugar yield from sugar beets grown in a loam soil. Water application rates were reduced to 35 to 50% of evapotranspiration (ET) rates without adverse effects. Root yields increased up to 80% ET, then decreased. Sugar yields (14 to 20%) were inversely related to water application. However, in sandy soil, sugar beet root yield increased with water applied, indicating that irrigation rate cannot be decreased much below the leveling-off point, 80% ET. Sugar levels were practically constant, at 17%. (Cassar-FRC)

IRRIGATION EFFICIENCY IN SUGARCANE,
Indian Inst. of Sugarcane Research, Lucknow.
S. R. Prasad, N. S. L. Srivastava, and M. Alam.
Indian Journal of Agricultural Sciences, Vol 50, No 3, p 252-260, March, 1980. 4 Fig, 5 Tab, 3 Ref.

Descriptors: *Irrigation efficiency, *Sugarcane, Furrow irrigation, Efficiencies, Skip furrow irrigation, Irrigation systems, Sugar crops, Agriculture, *India, Water conservation.

Flood, furrow, and skip-furrow irrigation were studied in an effort to find the most water efficient irrigation methods for sugarcane on sandy loam soil in India during 1975-1978. Two irrigation frequencies were included--irrigation at 25% and at 50% of available soil moisture (ASM). Maximum water use efficiency was found with skip-furrow irrigation, which saved an average of 36.5% compared with the flood method. Sugarcane yields (74.20 tons per hectare) from skip-furrowing were highest in one year and on a par with the flood method (61-70 tons per hectare) in other years. Furrow irrigation yielded consistently less cane. Irrigation at 50% ASM produced more cane (in tons per hectare), 64.75 to 76.03, than at 25% ASM, 53.41 to 56.22. Quality of sugarcane juice was unaffected by any variables. (Cassar-FRC)

L. Hogan, and D. Palzkill.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-182180, Price codes: A02 in paper copy, A01 in microfiche. Project Completion Report, March 10, 1981. 7 p, 1 Tab, 5 Ref. OWRT-A-098-ARIZ(1), 14-34-0001-0103.

Descriptors: *Water requirements, Cold-tolerance, *Cold resistance, *Crop response, Irrigation efficiency, *Water conservation, *Arizona, Test crops, Avra Valley, *Jojoba, Simmondsia chinensis.

Jojoba, Simmondsia chinensis (Link) Schneider is a plant that offers possibilities as a new crop for areas in Arizona where water is scarce and expensive. The Avra Valley is one such area. Two impediments to jojoba cultivation in the Avra Valley are (1) the amount of supplemental irrigation water needed for successful cultivation of jojoba are not known, and (2) planting-stock presently available is not cold-tolerant enough for that area. A study has been initiated to study several irrigation regimes on jojoba performance in this valley and to identify cold-tolerant individuals which could be used for variety improvement. A field planting was established using germplasm from 60 accessions. A drip irrigation system was constructed that allows each of 12 rows in the field to be irrigated independently with small, metered amounts of water. Less than 1/100th of an acre-foot of water was used during the establishment phase of this planting. For all of 3 irrigation intervals studied, a planting depth of 2 inches was found to be superior to shallower or deeper depths. Shallow planting (1 inch) gave poor results with longer irrigation intervals, and the deepest planting (4 inches) gave poor results at all irrigation intervals.

SIMULATING THE WATER REQUIREMENTS AND ECONOMIC FEASIBILITY OF CORN IN THE MIDWEST,
Kentucky Water Resources Research Inst., Lexington.
W. L. Palmer, B. J. Barfield, M. E. Bitzer, and C. T. Haan.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-182230, Price codes: A10 in paper copy, A01 in microfiche. Research Report No 125, 1981. 205 p, 50 Fig, 11 Tab, 100 Ref. OWRT-B-055-KY(1), 14-34-0001-8088(FY1978).

Descriptors: *Irrigation design, *Crop response, Crop production, Field crops, *Economic feasibility, Economic justification, Scheduling, Water storage, *Irrigation programs, *Corn, *Midwest region, *Simulation model, Crop growth, Water requirements for irrigation, Reservoir size.

An evaluation of the economics of supplemental irrigation when using a surface water supply must be site specific in order to account for variations in soil moisture holding capacity, watershed area supplying the runoff, climatic conditions, and proposed irrigation management procedures. With the use of farm specific simulation models to determine grain yields, availability of irrigation water, and economic expenditures involved in irrigation, an economic evaluation of supplemental irrigation can be performed. In the model presented in this report, the Duncan SIMAIZ model is used to predict grain yields using long-term daily weather information. SIMAIZ also determines irrigation water demand for the crop. The Haan Water Yield Model is used to predict flow into a reservoir using the same weather information. By knowing daily water flow into a reservoir and water demand for irrigation, a reservoir size is determined which will supply water at all times for the study period. Simulations are then run by incrementally reducing, by volume, the size of this reservoir, thus limiting the availability of irrigation water, and resulting in reduced irrigated yields. An economic evaluation is performed for each reservoir size. Costs and benefits are: initial cost of constructing the reservoir, yearly reservoir maintenance cost, yearly irrigation costs of operation, and additional income resulting from the increase in grain yields. This model can be used as a tool for evaluating which irrigation practices, if any, are economically feasible.

HEAT-POWERED WATER PUMP,
Utah State Univ. Foundation, Logan. (Assignee).
D. G. Chadwick.
U.S. Patent No 4,197,060, 5 p, 1 Fig, 12 Ref; Official Gazette of the United States Patent Office, Vol 993, No 2, p 578, April 8, 1980.

Descriptors: *Patents, *Equipment, *Heat pumps, Solar radiation, Irrigation practices, Heated water, Irrigation efficiency, Heat exchange.

A heat-powered water pump includes a flexible diaphragm as the pumping element with a volatile liquid as a working fluid. The flexible diaphragm is enclosed within a vessel and isolates the working fluid from the water to be pumped. One-way valves control the direction of water flow through the pump. A U-shaped siphon tube acts as a temporary reservoir for the pumped water and is siphoned empty after being filled. A portion of the water siphoned from the U-shaped siphone tube is recirculated through the vessel in heat exchange relationship with the working fluid to condense the working fluid. A reservoir of warm water is maintained in thermal contact with the flexible diaphragm to minimize condensation of the working fluid by thermal contact with the water through the diaphragm. Heat energy from either solar energy or combustion of agricultural wastes is used to vaporize the working fluid. The object of the invention is to provide a heat-powered water pump for use in primitive areas without electrical power to pump irrigation water. (Sinha-OEIS)

4. WATER QUANTITY MANAGEMENT AND CONTROL

4A. Control Of Water On The Surface

APPLICATIONS OF THE COMPARTMENTED RESERVOIR IN ARIZONA,
Arizona Water Resources Research Center, Tucson.
C. B. Cluff, and F. Putman.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-182271, Price codes: A03 in paper copy, A01 in microfiche. Project Completion Report, January, 1981. 39 p, 10 Fig, 8 Tab, 18 Ref, Append. OWRT-A-082-ARIZ(1), 14-34-0001-8003.

Descriptors: *Water storage, *Water conservation, Evaporation control, *Reservoir design, *Arizona, Irrigation, Compartmented reservoirs, Water supply, Water utilization.

This report contains the results of a one year study to apply the compartmented reservoir concept to water storage problems in Arizona. The range of selected projects was from a ten thousand cubic meter (8.1 af) reservoir for a water harvesting agrisystem at Black Mesa, to a 238 million cubic meter (200,000 af) flood control dam, Tat Momolikot Dam on the Papago Reservation, to supply water for irrigation. Other sites studied were the Santa Cruz River at Continental, to supply an industrial/domestic water, Leslie Creek site for recreation, and improvement of Mormon Lake for recreation. Evaporation from Tat Momolikot and Mormon Lake are presently consuming most of the available water. Through compartmentalization this evaporation can be significantly reduced. At the other potential dam sites on the Santa Cruz and Leslie Creek the use of a compartmented reservoir will make these otherwise marginal projects practical. The Black Mesa Agrisystem is presently demonstrating the utility of the compartmented reservoir system.

Field 4—WATER QUANTITY MANAGEMENT AND CONTROL

Group 4A—Control Of Water On The Surface

REPORT OF THE RIVER MASTER OF THE DELAWARE RIVER FOR THE PERIOD DECEMBER 1, 1978--NOVEMBER 30, 1979,
Geological Survey, Reston, VA. Water Resources Div.
F. T. Schaefer, and R. E. Fish.
Geological Survey Delaware River Master Report, 1980. 94 p, 6 Fig, 19 Tab, Append, 1 Plate.

Descriptors: *Reservoir operation, *Delaware River, *Reservoir storage, *Reservoir releases, *Water quality, New Jersey, New York, Pennsylvania, Hydrologic data, Streamflow, Flow control, Hydrologic budget, Water supply, Water distribution(Applied), Diversion, Estuaries, Water analysis, Saline water intrusion.

Water supply conditions for the year ending November 30, 1979, were above average in the upper Delaware River basin. Combined storage in Pepacton, Cannonsville, and Neversink Reservoirs of the city of New York was 87.1% of capacity on that date. Diversions for water supply for New York City for the year averaged 735 million gallons per day, compared to a maximum allowable rate of 800 million gallons per day. Releases were designed to maintain a flow of 1,750 cubic feet per second at the U.S. Geological Survey gaging station, Delaware River at Montague, N.J. Augmented conservation releases were made, at times, on an experimental basis for the purpose of enhancing environmental characteristics in the stream segments downstream from the reservoirs. Diversions by the State of New Jersey were less than the authorized monthly average of 100 million gallons per day and less than the authorized maximum daily diversion of 120 million gallons per day. Water quality of the Delaware River and Estuary was monitored on a continuous basis at eight sites and on a monthly basis at ten sites. (USGS)

4B. Groundwater Management

ANALYTICAL STUDY OF THE OGALLALA AQUIFER IN HANSFORD COUNTY, TEXAS, PROJECTIONS OF SATURATED THICKNESS, VOLUME OF WATER IN STORAGE, PUMPAGE RATES, PUMPING LIFTS, AND WELL YIELDS,
Texas Dept. of Water Resources, Austin.
A. E. Bell, and S. Morrison.
Report 257, October, 1980. 64 p, 18 Tab, 76 Ref, 24 Maps.

Descriptors: *Texas, *Aquifers, *Groundwater, *Recharge, *Water table, *Irrigation, Storage depletion, Water wells, Data collections, Computer programs, Digital computers, Rainfall, Storage coefficient, Porosity, *Ogallala aquifer, Hansford County.

An annual overdraft that is approximately eleven times the rate of natural recharge to the Ogallala aquifer could lead to severe water shortages in Hansford County. Wateruse patterns between 1960 and 1972 as reflected in water level changes in wells measured in the High Plains of Texas were used as the principal data source for developing an aquifer depletion schedule. Based on this depletion schedule, a computer program was written to calculate future saturated thickness and individual well sites. Because the Ogallala is not a homogenous formation, the thickness of layers, layering position, and grain-size sorting will affect well-yields. An electronic digital computer was used to construct maps which reflect the saturated thickness of the aquifer for those years included in the study. Estimates of current pumpage were obtained by calculating the storage capacity of the dewatered section of the aquifer as reflected in changes in the annual depth-to-water measurements made in the water level observation wells. Factors for natural recharge and irrigation recirculation were then added to these volumetric figures to obtain more realistic pumpage estimates. Using maps, charts, and tabulations, this report makes projections, but not absolute predictions, about aquifer depletion. (Garrison-Omniplan)
W81-02336

ANALYTICAL STUDY OF THE OGALLALA AQUIFER IN OCHILTREE COUNTY, TEXAS, PROJECTIONS OF SATURATED THICKNESS, VOLUME OF WATER IN STORAGE, PUMPAGE RATES, PUMPING LIFTS, AND WELL YIELDS,
Texas Dept. of Water Resources, Austin.
A. E. Bell, and S. Morrison.
Report 258, October, 1980. 64 p, 18 Tab, 24 Maps.

Descriptors: *Texas, *Aquifers, *Groundwater, *Water table, *Recharge, Irrigation, Pumping, Test wells, Overdraft, Storage depletion, Data collection, Computer programs, Storage coefficient, Digital computers, Dewatering, *Ogallala aquifer, Ochiltree County.

The distribution of groundwater in Ochiltree County is very uneven. Historical pumpage has exceeded 175,000 acre-feet annually, which is approximately eight times the rate of natural recharge to the Ogallala aquifer in this county. Included in this report are projections of saturated thickness, the volume of water in storage, pumpage rates, pumping lifts, and well yields in Ochiltree County, which produces a total annual farm income of over $50 million. Water-use patterns between 1960 and 1972 were used to develop an aquifer depletion schedule, and a computer program was written to calculate future saturated thickness at individual well sites. To estimate the volume of water storage in the Ogallala, an electronic digital computer was used to construct maps which reflect the saturated thickness of the aquifer Estimates of current pumpage were also obtained by calculating the storage capacity of the dewatered section of the aquifer as reflected in changes in the annual depth-to-water measurements made in the water level observation wells. Factors for natural recharge and irrigation circulation were then added to these volumetric figures to obtain more realistic pumpage estimates. Because some areas in Ochiltree County were found to have a short supply of groundwater, conservation is strongly recommended. (Garrison-Omniplan)

Descriptors: *Water resources, *Indian reservations, *Washington, Available water, *Water quality, Surface waters, Groundwater potential, Aquifer characteristics, Hydrogeology, Water yield, Water demand, Chemical analysis, Water supply, *Port Gamble Indian Reservation(WA), Kitsap County(WA), Western Washington

A study of the water resources of the Port Gamble Indian Reservation, Wash., has shown that there is probably a substantial quantity of good quality ground and surface water available to provide for further development of the reservation. Groundwater supplies are available from an artesian aquifer underlying the reservation near sea level This aquifer is estimated to be capable of supplying at least 90 gallons per minute, continuously, without greatly increasing chances for seawater intrusion. This quantity of water is enough to supply about 800 to 900 additional residents on the reservation. Another artesian aquifer, relatively unexplored, was noted underlying the previously mentioned artesian aquifer. This lower aquifer may be capable of supplying additional groundwater for use on the reservation. Groundwater quality was found to be good for most uses, being moderately hard and having moderately high iron concentrations. No evidence of pollution of the groundwater was found during this study from either seawater intrusion or contamination from a nearby solid-waste disposal site. Surface-water resources studied on the reservation included two streams, Middle and Little Boston Creeks, whose 7-day low flows were estimated to be 0.4 and 0.2 cubic foot per second, respectively, for a 20-year estimated recurrence interval. The surface-water quality was also found to be good for most uses and was within the limits established by the U.S. Environmental Protection Agency for untreated drinking water Thus, the water from these two streams, Middle and Little Boston Creeks, could be used as domestic supplies to supplement the groundwater withdrawals. RECONNAISSANCE OF GROUNDWATER IN THE VICINITY OF GUNNISON AND CRESTED BUTTE, WEST-CENTRAL COLORADO,
Geological Survey, Lakewood, CO. Water Resources Div.
T. F. Giles.
Available from the OFSS, USGS Box 25425, Fed. Ctr., Denver, CO 80225. Price: $7.00 in paper copy, $1.00 in microfiche. Geological Survey Open-File Report 80-12 (WRI), May, 1980. 23 Ref, 2 Sheets.

Descriptors: *Groundwater resources, *Aquifers, *Water supply, *Water quality, *Colorado, Hydrogeology, Hydrologic data, Maps, Groundwater availability, Water wells, Well data, Water yield, Hydraulic systems, Aquifer characteristics, Groundwater movement, Geohydrologic units, Water quality standards, Chemical analysis, West-central Colorado, Gunnison-Crested Butte area(CO).

Hydrologic data was collected in the Gunnison-Crested Butte area, Colo., to determine the availability and chemical quality of groundwater. Parts of the area have undergone rapid population growth in recent years due to an increase of winter sports activities. This rapid growth has resulted in a demand for additional domestic, recreational, and municipal water supplies. Maximum yields of 100 gallons per minute are available from wells completed in the alluvial aquifers while as much as 60 gallons per minute may be obtained from wells completed in the Dakota and Entrada Sandstones

Yields from other aquifers generally are less than 25 gallons per minute. Calcium magnesium bicarbonate water is the predominant water type in the study area. Dissolved solids concentrations ranged from 30 to 829 milligrams per liter and hardness ranged from 18 to 400 milligrams per liter. (USGS)

CHEMICAL AND MICROBIOLOGICAL MONITORING OF A SOLE-SOURCE AQUIFER INTENDED FOR ARTIFICAL RECHARGE, NASSAU COUNTY, NEW YORK,
Geological Survey, Syosset, NY. Water Resources Div.
B. G. Katz, and G. E. Mallard.
Available from the OFSS, USGS Box 25425, Fed. Ctr., Denver, CO 80225, Price: $2.50 in paper copy, $3.50 in microfiche. Geological Survey Open-File Report 80-567, 1980. 18 p, 4 Fig, 5 Tab, 19 Ref.

Descriptors: *Monitoring, *Chemical analysis, *Microbiology, *Reclaimed water, *Artificial recharge, Injection wells, Storm runoff, Aquifer characteristics, Groundwater, Groundwater recharge, Water table, Water quality, Water supply, New York, *Long Island(NY).

In late 1980, approximately 4 million gallons per day of highly treated wastewater will be used to recharge the groundwater reservoir in central Nassau County through a system of 10 recharge basins and 5 shallow injection wells. To evaluate the impact of large-scale recharge with reclaimed water on groundwater quality, the U.S. Geological Survey has collected hydrologic and water-quality data from a 1-square-mile area around the recharge site to provide a basis for future comparison. Extensive chemical and microbiological analyses are being made on samples from 48 wells screened in the upper glacial (water-table) aquifer and the upper part of the underlying Magothy (public-supply) aquifer. Preliminary results indicate that water from the upper glacial aquifer contains significant concentrations of nitrate and low-molecular-weight chlorinated hydrocarbons and detectable concentrations of organochlorine insecticides and polychlorinated biphenyls. At present, no fecal contamination is evident in either aquifer in the area studied. In the few samples containing fecal indicator bacteria, the numbers were low. Nonpoint sources provide significant loads of organic and inorganic compounds; major sources include cesspool and septic-tank effluent, cesspool and septic-tank cleaners and other over-the-counter domestic organic solvents, fertilizers, insecticides for termite and other pest control, and stormwater runoff to recharge basins. The water-table aquifer is composed mainly of stratified, well-sorted sand and gravel and, as a result, is highly permeable. In the 1-square-mile area studied, some contaminants seem to have traveled 200 feet downward to the bottom of the water-table aquifer and into the upper part of the public-supply aquifer. (USGS)

HYDROLOGIC DATA FOR URBAN STUDIES IN THE SAN ANTONIO, TEXAS METROPOLITAN AREA, 1977,
Geological Survey, Austin, TX. Water Resources Div.
R. Perez, and L. Harmsen.
Geological Survey Open-File Report 80-743, June, 1980. 100 p, 1 Fig, 6 Tab, 5 Ref.

Descriptors: *Urban hydrology, *Rainfall-runoff relationships, *Storm runoff, *Urban runoff, Hydrologic data, Small watersheds, Streamflow, Flow rates, Peak discharge, Flood profiles, Watershed management, *Texas, San Antonio(TX).

This report contains rainfall, runoff, and water-quality data collected during the 1977 water year for the San Antonio, Tex., metropolitan area. The information will be useful in determing the effects of various stages of urbanization on flood discharge and runoff and in determining chemical constituents in surface-water runoff from floods of various magnitudes during all seasons of the year from areas with different types of utilization. Detailed rainfall-runoff computations are presented for several storm periods during the 1977 water year. (USGS)

4D. Watershed Protection

BUILDING WATER QUALITY OBJECTIVES INTO CONSERVATION PLANNING MODELS,
Economics and Statistics Service, Broomall, PA.
C. W. Ogg.
In: Nonpoint Pollution Control -- Tools and Techniques for the Future, Proceedings of a Technical Symposium, p 129-134, 1981. 1 Fig, 15 Ref.

Descriptors: *Nonpoint pollution sources, *Pennsylvania, *Model studies, *Computer models, Mathematical models, Erosion, Environmental effects, Agricultural runoff, Land use, *Erosion control, Sedimentation, Phosphorus, Pesticides, Linear programming.

A linear programming water quality model was modified to make it applicable to rural nonpoint pollution control programming in south eastern Pennsylvania. The model uses the Universal Soil Loss Equation and the Williams equation to estimate delivered sediment and runoff for each soil-land use combination. The estimates are broken down by farming activities and are used to estimate dissolved and absorbed chemical losses. Aggregates of these losses provide watershed level estimates. In the model tableau, each column represents a different soil agronomic complex. The model has rows for objectives, production, land resources, environment, and technology. The rows for runoff values and sediment values allow the design of more efficient strategies for reducing sediment loads. The model is primarily suited to designing the most efficient affordable management strategy once the need for handling of nonpoint sources has been established. The model's major limitation is in the area of estimating total nonpoint versus point sources of pollution. (See also W81-02276) (Seigler-IPA)

EFFECTIVENESS OF BEST MANAGEMENT PRACTICES IN CONTROLLING NONPOINT POLLUTION FROM COMMERCIAL CLEARCUTS,
Pennsylvania State Univ., University Park. Coll. of Agriculture.
J. A. Lynch, and E. S. Corbett.
In: Nonpoint Pollution Control -- Tools and Techniques for the Future, Proceedings of a Technical Symposium, p 213-224, 1981. 3 Fig, 5 Tab, 6 Ref.

Descriptors: *Pennsylvania, *Best management practices, *Nonpoint pollution sources, *Forest management, Erosion control, Soil conservation, Herbicides, Monitoring, Forestry, *Lumbering, Clear-cutting, Watershed management, Runoff, Sediments.

A commercial clearcut experiment and a clearcut-herbicide experiment were conducted on the Leading Ridge Experimental Watersheds, three adjacent watersheds in central Pennsylvania, to study the relationship between silviculture practices and nonpoint pollution. All three watersheds were equipped with modified broad-crested Trenton weirs to measure stream discharge. For the clearcut-herbicide experiment, the smallest watershed was clearcut in three progressive phases, lower slope (1967), middle slope (1972), and upper slope (1976). Herbicides were used to eliminate revegetation after the second and third cuts so that comparisons between phases could be made. For the commercial clearcut experiment, 110 acres of the 257 acre watershed were harvested using Pennsylvania's 'Best Management Practices'. Results within two years after the commercial clearcut show that the Pennsylvania 'Best Management Practices' were sufficient to control nonpoint source pollution during and following logging. Changes in concentrations of nutrients studied were superficial and the total impact was slight and perhaps beneficial. The herbicide clearcut did produce significant deleterious environmental changes. (See also W81-02276) (Seigler-IPA)

BALANCING PUBLIC AND PRIVATE CONTROLS AT THE SUBURBAN COUNTY LEVEL,
Adams County Board of Commissioners, Brighton, CO.
J. L. Colt, and J. T. Smullen.
In: Nonpoint Pollution Control -- Tools and Techniques for the Future, Proceedings of a Technical Symposium, p 259-266, 1981. 3 Fig.

Descriptors: *Colorado, *Urban runoff, *Nonpoint pollution sources, *Erosion control, Inspection, Percolation, Construction sites, Cities, Storm runoff, Urban drainage, Building codes, Land use, Zoning, Mapping.

The Adams County, Colorado Board of Commissioners worked extensively with the Denver

Region Council of Governments to develop a county plan for local urban runoff problems. The County's jurisdictional area is large, 1,268 sq mi, with considerable suburban population and housing growth. Early efforts were made to encourage land development in areas that were either less erodible, or more deeply permeable. The Adams County program is predominantly nonstructural, inexpensive to implement, and is designed to appeal to the small land developer. The program is expressed in relatively simple logic so that it is readily understandable. Percolation studies were conducted and best management practices to enhance percolation systems were recommended. Single-standard controls for limiting erosion and sediment from construction sites were developed rather than the typical 'sliding scale' ordinances. Surface erodibility and fertility maps were prepared to indicate the level of control needed for an area. The control program is enjoying local public acceptance and popularity. 5. WATER QUALITY MANAGEMENT AND PROTECTION

5A. Identification Of Pollutants

DETERMINATION OF CHLOROBENZENES IN WATER BY CAPILLARY GAS CHROMATOGRAPHY,
Canada Centre for Inland Waters, Burlington (Ontario).
B. G. Oliver, and K. D. Bothen.
Analytical Chemistry, Vol 52, No 13, p 2066-2069, November, 1980. 3 Fig, 3 Tab, 11 Ref.

Descriptors: *Chlorobenzenes, *Pollutant identification, *Water analysis, Organic compounds, Analytical techniques, Chromatography, *Gas chromatography.

Chlorobenzenes in water samples were concentrated 1,000 and 2,500 times into pentane, using Chromosorb 102 or liquid-liquid extraction with pentane, respectively. The capillary gas chromatography-electron capture detection method was used to quantitate all 12 chlorobenzenes. Detection limits were (in nanograms per liter): 0.01 for penta- and hexachlorobenzene, 0.05 for tetrachlorobenzenes, 0.1 for trichlorobenzenes, 1 for dichlorobenzenes, and 500 for monochlorobenzene. FLOW INJECTION ANALYSIS USING POTASSIUM PERMANGANATE: AN APPROACH FOR MEASURING CHEMICAL OXYGEN DEMAND IN ORGANIC WASTES AND WATERS,
Okayama Univ. (Japan). School of Engineering.
T. Korenaga.
Analytical Letters, Vol 13, No A11, p 1001-1011, 1980. 2 Fig, 1 Tab, 7 Ref.

Descriptors: *Analytical technique, *Chemical oxygen demand, *Equipment, Organic matter, Spectrophotometry, Municipal wastes, Rivers, Flow injection analysis.

A rapid and continuous analytical method based on flow injection analysis was developed for the determination of COD due to organic substances in polluted water. The apparatus uses a double reciprocating micro-pump, a constant-volume sampling valve, a spectrophotometer, a recorder, and various lengths of polytetrafluoroethylene tubing. Potassium permanganate and sulfuric acid solutions were individually pumped up as oxidizing agents, and glucose was used as a standard substance. All samples were filtered with a 0.45 micron pore size membrane filter, and dissolved COD substances were measured. Municipal sewage, human wastes, and river water were examined, and COD values agreed with those obtained using the JIS method within the permissible error range of + or - 30%. (Small-FRC)

FACTORS TO CONSIDER IN ORGANIZING SAMPLING AND ANALYSES FOR PRIORITY POLLUTANTS IN WASTE WATERS,
National Council of the Pulp and Paper Industry for Air and Stream Improvement, Inc., Gainesville, FL.
R. P. Fisher, and R. R. Claeys.
Tappi, Vol 64, No 1, p 63-66, January, 1981. 6 Ref.

Descriptors: *Sampling, *Pulp and paper industry, *Pollutant identification, Analytical techniques, Industrial wastes, Mercury, Trace metals, Chemical analysis, Laboratory tests, Water analysis, Chromatography, Pulp wastes, *Waste water.

Analysis of pulp and paper waste waters for toxic pollutants by independent firms under contract involves several factors. The contract analytical lab should have gas chromatography/mass spectrometry capabilities to perform analyses by Series 624 and 625 methods, have specific experience in the pulp and paper industry, and be EPA approved. The practice of sub-contracting some of the work can give rise to communication problems. Sample collection may be done by two contractors to assure blind replicates. Precautions in sample collecting involve use of medical grade silicone rubber tubing and suitable containers--borosilicate vials or bottles for organic samples, polyethylene bottles for trace element samples. The importance of sample preservation is emphasized. Volatile organics must be kept at 4C for no greater than 7 days; trace metal and mercury samples must be acidified with nitric acid. (Cassar-FRC)

RELIABILITY OF AN ELECTRODE AND A WATER ANALYSIS KIT FOR DETERMINATION OF AMMONIA IN AQUACULTURE SYSTEMS,
Texas A and M Univ., College Station. Dept. of Wildlife and Fisheries Sciences.
M. L. Cuenco, and R. R. Stickney.
Transactions of the American Fisheries Society, Vol 109, No 5, p 571-576, September, 1980. 5 Tab, 13 Ref.

Descriptors: *Water analysis, *Ammonia, *Aquaculture, *Electrodes, Analytical techniques, Fish, Shrimp, *Pollutant identification.

Total ammonia nitrogen (TAN) was determined by an ammonia electrode and by the nesslerization procedure in a Hach water quality test kit in standard solutions, well water, and water from several aquaculture systems. The ammonia electrode performed well in the analysis of standard solutions and water from aquaculture systems. Distillation did not improve accuracy or precision when used with raw water samples, but TAN concentrations were affected by interferences from high alkalinity and iron when water from some wells was analyzed without distillation. The Hach test kit showed less precision and accuracy in the standard solution analysis, producing consistently higher readings. This is of little significance at higher levels (10 mg per liter), but at concentrations around 1 mg per liter the results could cause unwarranted concern. The test kit gave poorer results in raw water samples enriched with manure and in the undistilled high alkaline, high iron water samples. (Cassar-FRC)

STUDIES ON THE TOXICITY OF PULP AND PAPER MILL EFFLUENTS - II. MUTAGENICITY OF THE EXTRACTS OF THE LIVER FROM SPOTTED SEA TROUT (NIBEA MITSUKURII),
Shizuoka Coll. of Pharmaceutical Sciences (Japan).
N. Kinae, T. Hashizume, T. Makita, I. Tomita, and I. Kimura.
Water Research, Vol 15, No 1, p 25-30, January, 1981. 5 Fig, 7 Tab, 4 Ref.

Descriptors: *Trout, *Toxicity, *Pulp wastes, Fisheries, Fish, Effluent, Industrial wastes, Genetics, Water pollution sources, Assay, Analytical techniques, Pollutant identification, Evaluation, Mass spectrometry, Gas chromatography, Pulp and paper industry.

Ether extracts of the livers of tumor-bearing fish from coastal waters in the vicinity of pulp and paper mill discharges were assayed for mutagenic substances. Assays using S. typhimurium followed by the fractionation of the extract by high-speed liquid chromatography (HLC) revealed the presence of mutagenic compounds. Twelve compounds identical to those identified in sediments from the vicinity were found, including 9,10-epoxystearic acid. (Titus-FRC)

USE OF AN IN SITU ARTIFICIAL SUBSTRATE FOR BIOLOGICAL ACCUMULATION AND MONITORING OF AQUEOUS TRACE METALS--A PRELIMINARY FIELD INVESTIGATION,
Academy of Natural Sciences, Philadelphia, PA.
S. L. Friant, and H. Koerner.
Water Research, Vol 15, No 1, p 161-167, January, 1981. 2 Fig, 3 Tab, 19 Ref.

Descriptors: *Bioindicators, *Trace elements, Metals, *Algae, Diatometer, Diatoms, *Pollutant identification, Water pollution, Chromium, Water analysis, Zinc, Copper, Mercury, Antimony, Food chains, *Heavy metals.

The diatometer, which consists of glass slides upon which indigenous aquatic microflora can attach and grow, was used in trace metal measurements in river water near a synthetic fiber manufacturing plant. Substrates were exposed for 2 week periods during the 6 month study. Concentrations of Cr, Cu, Hg, and Sb were the same in sediment samples above and below the plant waste water outfall. However, Zn concentration was very slightly higher below the outfall. The diatometer results were similar to sediment results with the exception of significantly higher Cr levels in water near the outfall. Cr is the only metal studied in this work which is known to be a constituent of the plant discharge. Thus the algae growing on the artificial substrate accumulated metals present in the water, rather than from the sediment, and were a more realistic indicator of a point source than were sediment samples. (Cassar-FRC)
W81-02192

A BIOASSAY APPLICATION FOR QUANTITATIVE TOXICITY MEASUREMENTS, USING THE GREEN ALGAE SELENASTRUM CAPRICORNUTUM,
G. Joubert.
Water Research, Vol 14, No 12, p 1759-1763, December, 1980. 1 Fig, 2 Tab, 26 Ref.

Descriptors: *Bioindicators, *Toxicity, *Chlorophyta, *Bioassay, Water analysis, Industrial wastes, Toxins, Measurement.

A bioassay method is proposed for toxicity value based on Selenastrum capricornutum, a sensitive organism belonging to the first link in the food chain. A toxic dose of a substance contained in a water sample inhibited the algae population, the effect was one of no growth. Even when incubation periods were extended to 14, 18, 21 and 25 days, no significant increases in cell counts were observed. The method is a simple and inexpensive tool for evaluating liquid samples. Sufficient nutrients to enable the growth of a biomass of 50 mg of algae must be added to the sample to prevent error. Other freshwater unicellular algae such as Chlorella were also successfully used. Of course, the test cannot measure the effects of ammonia or phosphorus as toxicants, but this is a minor incon-

venience. The test can be applied to industrial wastes and samples from the natural environment. Its major advantage is that it permits a quantitative assessment of toxicity; it is possible to express toxicity in the number of toxic units as defined by Sprague and Ramsey (1965). (Small-FRC)

ALGAL ASSAY STUDIES OF WASTE WATER POLLUTED LAKES,
National Swedish Environment Protection Board, Uppsala. Algal Assay Lab.
A. Claesson, and A. Forsberg.
Archiv fur Hydrobiologie, Vol 89, No 1/2, p 208-224, June, 1980. 5 Fig, 3 Tab, 17 Ref.

Descriptors: *Algae, *Waste water(Pollution), *Eutrophication, Nitrogen compounds, Phosphorus compounds, Bioassay, Nutrients, Chlorophyll, *Sweden, Aquatic algae, Limnology, Pollutant identification, *Lakes, Water pollution, Growth rates, Water quality, Trace elements.

Twenty-nine Swedish lakes receiving waste waters were monitored weekly during the growing seasons (June-September) of 1972-1975 with measurements of chlorophyll a and nutrients. Although the total chlorophyll variations usually followed the total nitrogen and total phosphorus variations, the algal growth potential did not always correspond with the limiting nutrient content. N was most growth limiting in 57% of the samples, P in 32%, and both in 11%. The lakes were classified as follows: 16 N-limited, 9 P-limited, and 4 N+P-limited. Occasionally EDTA and/or trace elements were found to be limiting factors. When samples were grouped as above, correlations were found between inorganic nutrients and algal growth potential and between total nutrients and total chlorophyll. In lake water samples with N/P quotients below 10, N was the limiting nutrient, and in samples with quotients above 18, P was limiting. (Cassar-FRC)

MERCURY ACCUMULATION IN BIOTA OF THUNDER CREEK, SASKATCHEWAN,
Saskatchewan Dept. of the Enviroment, Regina. Inland Waters Directorate.
D. J. Munro, and W. D. Gummer.
Bulletin of Environmental Contamination and Toxicology, Vol 25, No 6, p 884-890, December, 1980. 1 Fig, 3 Tab, 9 Ref.

Descriptors: *Mercury, *Aquatic animals, *Crayfish, *Fish, *Food chains, Bioindicators, Crustaceans, Thunder Creek, Canada, Invertebrates, Pollutant identification, Sediments, Path of pollutants, *Saskatchewan.

Crayfish and fish were collected in Thunder Creek, Saskatchewan, to determine the mercury levels in the food chain. High levels of Hg (up to 89 mg per kg) had previously been determined in sediment from this creek at the downstream sampling location. The upstream site served as a control. Crayfish contained an average of 0.22 mg per kg at the downstream site and 0.08 mg per kg at the upstream control location. Brook stickleback had an average mercury concentration of 0.09 mg per kg upstream and 0.15 mg per kg downstream; pearl dace, 0.03 mg per kg upstream and 0.07 mg per kg downstream. (Cassar-FRC)
W81-02228

ADHESION-BINDING OF 2,2',4,4',5'5'-HEXACHLOROBIPHENYL TO GLASS AND PLASTIC: A POSSIBLE SOURCE OF ERROR FOR PCB ANALYSIS,
Fordham Univ., Bronx, NY.
M. G. Pepe, and J. J. Byrne.
Bulletin of Environmental contamination and Toxicology, Vol 25, No 6, p 936-940, December, 1980. 3 Tab, 8 Ref.

Descriptors: *Polychlorinated biphenyls, *Analytical techniques, *Pollutant identification, Adsorption, Sedimentation.

Polychlorinated biphenyls (PCB) in aqueous solution were adsorbed by glass tubes and plastic tubes during storage tests. This indicated a possible source of error in determination of PCB in stored samples. A solution of 2,2',4,4',5,5'-C14-hexachlorobiphenyl in borosilicate glass culture tubes contained 1.18 ppm at the onset of the storage tests, 1.21 after 1 hour, 1.16 after 24 hours, 0.98 after 48 hours, 0.81 after 72 hours, and 0.41 after 144 hours. A similar test with plastic centrifuge tubes showed a decline from 1.16 ppm at zero hours to 0.12 at 144 hours. In the glass tubes, where sedimentation was predominant, 17 times more PCB was found at the bottom than on the side. The ratio of bottom to wall adsorption was 1.5 in the plastic tubes. When tubes were wiped and washed with ethanol, only 78.3% of the known PCB content was recovered from the glass tubes and 91.7% from the plastic tubes. (Cassar-FRC)

A SEQUENCING SEDIMENT TRAP FOR TIME-SERIES STUDIES OF FRAGILE PARTICLES,
Woods Hole Oceanographic Institution, MA. Dept. of Chemistry.
H. W. Jannasch, O. C. Zafiriou, and J. W. Farrington.
Limnology and Oceanography, Vol 25, No 5, p 939-943, September, 1980. 1 Fig, 1 Tab, 13 Ref.

Descriptors: *Sedimentology, *Sampling, *Instrumentation, On-site tests, *Sediment transport, Particle size, *Time series analysis.

A relatively simple sediment trap has been developed and tested in Buzzards Bay, Massachusetts, to collect up to 8 samples at equal intervals from 22.5 min to 256 days at pressures up to 600 atmospheres. The trap consists of a cylindrical trap unit 76 cm long and 25 cm diameter containing a sample-concentrating funnel (70 degree cone) at the bottom, 8 underlying sampling jars on an externally motor-operated turntable, and a pressure-tight electronics package. Viscous polymers such as polyacrylamide may be used to trap and preserve the sediment particles. (Cassar-FRC)

SEMIAUTOMATED DETERMINATION OF TOTAL PHOSPHORUS AND TOTAL KJELDAHL NITROGEN IN SURFACE WATERS,
Ontario Ministry of the Environment, Rexdale. Water Quality Branch.
J. Crowther, B. Wright, and W. Wright.
Analytica Chimica Acta, Vol 119, No 2, p 313-321, 1980. 1 Fig, 3 Tab, 4 Ref.

Descriptors: *Analytical techniques, *Nitrogen, *Phosphorus, Water quality control, Chemical analysis, Nutrients, Surface waters, Spectrometry.

A system was developed for precise and productive measurement of low levels of nitrogen and phosphorus in surface waters. A block digester with a temperature control unit was used to digest 40 samples simultaneously. For automated sample neutralization and colorimetric measurements a dual-channel AutoAnalyzer system was employed, consisting of a sampler, peristaltic pump, constant temperature unit, and two AAII colorimeters equipped with 50-mm flow cells. One colorimeter was filled with 630-nm filters, while the other had 880-nm filters. A second analytical system was used to validate the first system. By calibrating the AutoAnalyzer system with undigested standards, the data for digested standards were made to serve as a recovery check on the whole system. Twenty-four samples could be processed per hour. Common anions and cations were tested as potential interferences, but no problems were encountered. The increased productivity associated with the proposed system was reached without any significant loss in accuracy or precision. (Baker-FRC)
W81-02248

DETERMINATION OF URANIUM BY THERMAL AND EPITHERMAL NEUTRON ACTIVATION IN NATURAL WATERS AND IN HUMAN URINE,
Dalhousie Univ., Halifax (Nova Scotia). Chemistry Dept.
J. Holzbecher, and D. E. Ryan.
Analytica Chimica Acta, Vol 119, No 2, p 405-408, 1980. 1 Tab, 4 Ref.

Descriptors: *Analytical techniques, *Uranium, *Neutron activation analysis, Urine, Water quality control, Natural waters.

Thermal and epithermal neutron activation methods developed to detect uranium in natural waters and in human urine are described. All samples were acidified at time of collection. Aliquots of water samples were sealed in 2/5 dram vials. For preconcentration, acetate buffer of pH 5.2 was added to 100-ml samples followed by 2 ml of the aqueous oxine solution under stirring. The solution was heated and activated carbon suspension was added with rapid stirring. The suspension was stirred while cooling. The powder was filtered off with suction, washed and dried. It was then transferred to a polyethylene vial and sealed. Recoveries were always greater than 80%. Uranium was determined via its U-239 nuclide. For thermal activation the inner reactor core site was used while epithermal activation was done in the outer site of the reactor. Uranium concentrations in the collected water samples ranged from 11 to 143 ng/ml. Results show a large difference in uranium concentrations depending on the collection site within a relative small area, but even the lowest result is well above normal values for natural waters. Thus uranium in fresh natural waters can be determined in concentrations above 4 ngU/ml after short irradiation and counting times. For lower concentrations preconcentration with activated carbon and oxine is employed. (Baker-FRC)

AQUATIC MACROPHYTES AS INDICATOR FOR HEAVY METAL POLLUTION IN THE RIVER LEINE (WEST GERMANY). (MAKROPHYTISCHE WASSERPFLANZEN ALS BIOINDIKATOREN FUR DIE SCHWERMETALL-BELASTUNG DER OBEREN LEINE),
Institut fuer Physische Geographie, Frankfurt-am-Main (Germany, F.R.).
M. D. K. Abo-Rady.
Archiv fur Hydrobiologie, Vol 89, No 3, p 387-404, July, 1980. 3 Fig, 8 Tab, 33 Ref. (English abstract).

Descriptors: *Heavy metals, *Leine River, *Bioindicators, *Aquatic plants, Water pollution effects, Water pollution sources, Pollutant identification, Standards, Cadmium, Copper, Mercury, Nickel, Lead, Zinc, Metals, Goettingen, *West Germany, Water quality, Rivers.

Cladophora glomerata was the most promising of 4 aquatic macrophytes tested as bioindicators for heavy metals in river water. Other species used were Potamogeton pectinatus, Zannichellia palustris, and Phalaris arundinacea. Enrichment factors varied according to metal and species. The Zn concentration factor was 2,200; and Pb, 2,400. Metal samples were collected in the Leine River, upstream and downstream from the city of Goettingen, West Germany. Cd, Cu, Ni, Zn, and Hg levels were higher downstream (0.34, 7.5, 3.8, 11.5, and 0.11 ppb respectively) from the sewage outlets, but were below WHO maximum allowable concentrations for drinking water. (Cassar-FRC)

USE OF AN OXIDATIVE DESTRUCTION AND QUADRUPOLE MASS SPECTROMETRIC (QMS) DETECTION FOR THE DETERMINATION OF THE ORGANIC ELEMENTAL COMPOSITION OF SUSPENDED MATTER IN SURFACE WATER,
Rijksinstituut voor de Volksgezondheid, Bilthoven (Netherlands).
H. F. R. Reijnders, D. Onderdelinden, M. G. Visser, and B. Griepink.
Water Research, Vol 14, No 11, p 1645-1650, November, 1980. 6 Fig, 3 Tab, 6 Ref.

Descriptors: *Water analysis, *Mass spectrometry, *Organic matter, Separation techniques, Centrifugation, Carbohydrates, Surface waters, Water pollution, Pollutant identification, Proteins, Suspended solids, Chlorine, Carbon, Hydrogen, Sulfur, Nitrogen.

Elemental analysis of suspended organic matter in surface waters is becoming extremely important in the study of water pollution and the characterization of water types. A method involving oxidative destruction and quadrupole mass spectrometry was applied to the characterization and elemental analysis of suspended particulate of water samples from 12 different locations. The same sites included a brook, two waste water treatment plants, a ditch, four rivers, four canals and one canalized river, all located in the Netherlands. Solid matter was separated from the samples by centrifugation, concentration and drying. Spectrophotometric analyses for H, C, N, S and Cl were carried out, and the ratio of the organic to the inorganic fraction was determined. Results obtained by conventional methods and by the present technique on the elemental composition of a waste water treatment plant sludge were compared. A linear relationship was found only for the hydrogen vs. carbon content; however, the new method only required about 30 minutes for sample preparation and analysis. Further studies are recommended to determine more accurately the variance in the results from different origins. (Geiger-FRC)

COMPARISON OF SPECTROFLUOROMETRY AND ION-SELECTIVE ELECTRODE POTENTIOMETRY FOR DETERMINATION OF COMPLEXES BETWEEN FULVIC ACID AND HEAVY-METAL IONS,
New Hampshire Univ., Durham. Dept. of Chemistry.
R. A. Saar, and J. H. Weber.
Analytical Chemistry, Vol 52, No 13, p 2095-2100, November, 1980. 6 Fig, 1 Tab, 27 Ref

Descriptors: *Fulvic acids, *Metals, *Complexation, Pollutant identification, Fluorescence, Analytical techniques, Copper, Organic acids, Potentiometers, Fluorometry, Heavy metals, Lead, Ions, Chemical reactions.

Fluorescence properties of two fulvic acids, one soil-derived (SFA) and one water-derived (WFA), were examined. Maximum emission intensity occurred at 445-450 nm with excitation at 350 nm. This peak was unaffected by oxygen or electrolyte, KNO3, concentration. Emission intensity reached a maximum at pH 5 for SAF and about 3.5 for WFA, dropping off rapidly at lower pH. The paramagnetic ion Cu(2+) was most effective in quenching fluorescence. At pH 2.1 and below almost no quenching occurred, and it increased to a maximum about pH 6. Very similar cures were produced by the two methods, fluorometry and ion-selective electrode potentiometry, when mole ratio of total Cu(2+) to total SFA was plotted against % of original, metal-free fluorescence remaining at specified pH (fluorometry) and Cu(2+)/SFA versus number of bound Cu(2+) ions per fulvic acid molecule (potentiometry). Experiments at pH 1.4-1.5, where little metal-complexing occurs, showed that Cu(2+) and Pb(2+) produced a very small amount of quenching (3.5 and 3.8%) even with high metal ion concentrations. Ni(2+), Mn(2+), Co(2+), and Cd(2+) caused even less quenching. Pb(2+), a diamagnetic ion, was not as effective a quenching agent as Cu(2+). (Cassar-FRC)

TECHNIQUES FOR VIRUS DETECTION IN THE MARINE ENVIRONMENT,
Florida Water Resources Research Center, Gainesville.
G. Bitton, S. R. Farrah, E. M. Hoffmann, B. N. Feldberg, and Y. J. Chou
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-182149, Price codes: A04 in paper copy, A01 in microfiche. Publication No 53, 1981. 42 p, 1 Fig, 18 Tab, 49 Ref OWRT-A-036-FLA(1), 14-34-0001-0110

Descriptors: *Viruses, Detection techniques, *Seawater, *Sediments, Adsorption, Filters, *Pollutant identification.

This study dealt with the development of methodology for virus recovery from the marine environment. We have explored a variety of methods for the recovery of enteroviruses from seawater which has been inoculatd with high liters of poliovirus 1, 2, and 3, coxsackie B3 and echovirus 1 and 4. We have developed a technique based on the adsorption of viruses to Filterite filters, elution with 1% non-fat dry milk (NFDM), and organic flocculation of the eluates. This method resulted in the efficient recovery of most enteroviruses tested except for echovirus type 1. The method was also suitable for virus recovery from tap water. Various eluents were tested for their ability to desorb viruses from marine sediments. In laboratory experiments 4M urea-0.05M lysine was the most efficient in virus recovery from sediment. Although the method is time consuming, it results in a small volume of concentrate. The methods developed in the course of this study were used to recover indigenous viruses from estuarine water and sediments. Enteroviruses were found in both water and sediment in a section of Matanzas River which was closed with regard to shellfish harvesting.

QUANTIFICATION OF NUTRIENT LOADINGS TO THE CHESAPEAKE BAY: A STRATEGY,
Environmental Protection Agency, Annapolis, MD. Chesapeake Bay Program.
T. H. Pheiffer, J. T. Smullen, and C. J. Klein.
In: Nonpoint Pollution Control -- Tools and Techniques for the Future, Proceedings of a Technical Symposium, p 39-45, 1981. 2 Fig, 13 Ref.

Descriptors: *Chesapeake Bay, *Nutrients, *Nutrient loads, *Predictive modeling, Simulation analysis, *Model studies, Eutrophication, Monitoring, Land use, Data collections, Water quality, Mathematical models, Computer models, Remote sensing, *Nonpoint pollution sources.

A major objective of the Environmental Protection Agency's (EPA) Chesapeake Bay Program Eutrophication Work Plan is the quantification of nutrient loadings to the Bay from various sources. Data are being gathered from many sources to be used in a predictive model. Point source information from municipal and industrial sources is being synthesized from existing EPA and State and agency files. LANDSAT data will be used to perform land-use analyses to develop nonpoint source runoff projections. Fall line monitoring on the Susquehanna, Potomac, and James Rivers will provide data on suspended sediments, nutrients, metals, pesticides, fresh water discharge, and other physical and chemical parameters. Nonpoint monitoring programs are being conducted in the Occoquan and Ware River watersheds and in the Pequea Creek basin. The Hydrologic Simulation Program in Fortran has been selected for modeling of the non-tidal drainage basin of the Bay. Following verification of the model, it will be used to produce time series output of current and future loadings, land-use patterns, and input for a Bay-wide water quality model at the tidal Chesapeake. (See also W81-02276) (Seigler-IPA)

EVALUATION OF NONPOINT SOURCE SAMPLING, LOADING RATES, AND DATA TRANSFERABILITY FOR AN ESTUARINE DRAINAGE BASIN OF CHESAPEAKE BAY,
Tidewater Administration, Annapolis, MD
C. Bostater, B. Walker, and J. Weaver
In: Nonpoint Pollution Control -- Tools and Techniques for the Future, Proceedings of a Technical Symposium, p 64-73, 1981. 12 Fig.

Descriptors: *Chesapeake Bay, *Northeast Creek, Water sampling, *Phosphorus, Water quality, Rainfall-runoff relationships, Suspended load, Suspended solids, Nitrates, Nitrites, Nitrogen, Dissolved oxygen, Biochemical oxygen demand, *Nonpoint pollution sources, *Estuaries.

Monitoring of water quality parameters at the Northeast Creek USGS Gaging Station revealed that a high percentage of the total annual phosphorus load occurs during only a few days of the year due to rainfall events. Northeast Creek is the major freshwater input into the Northeast River, a subestuary of the Chesapeake Bay. The drainage area of 24.3 sq miles is approximately 40% agricultural, 50% forested, and 10% other. Water quality parameters measured include total Kjeldahl nitrogen, nitrite, nitrate, ortho-phosphorus, total phosphorus, dissolved oxygen, biochemical oxygen demand, suspended solids, total solids, and suspended volatile solids. Samples were collected using a proportional sampling technique with an ISCO automatic sampler and an ISCO pressure transducer flow meter. Results show a total phosphorus runoff coefficient of 1.54 lb/day/sq mi for a total for the watershed of 18.6 tons/year. A random sampling of flow-weighted mean total phosphorus concentrations shows that baseflow yield is important for annual nutrient export estimates. (See also W81-02276) (Seigler-IPA)
W81-02287

A FIELD-SCALE MODEL FOR NONPOINT SOURCE POLLUTION EVALUATION,
Science and Education Administration, Tucson., AZ. Southwest Watershed Center
W. G. Knisel
In: Nonpoint Pollution Control -- Tools and Techniques for the Future, Proceedings of a Technical Symposium, p 100-106, 1981. 15 Ref

Descriptors: *Nonpoint pollution sources, *Agricultural runoff, *Computer models, Mathematical models, Estimating, Erosion rates, Evapotranspiration, Pesticides, Sedimentation, Best management practices, Percolation, Particle size, Sediment load, Water pollution sources.

A field-scale simulation model, CREAMS, was developed to evaluate nonpoint source pollution from agricultural fields. The model does not require calibration and it can simulate processes in hydrology, erosion, plant nutrient losses, and pesticide losses as affected by management practices. CREAMS has three major components: hydrology, erosion/sedimentation, and chemistry. Runoff volume and peak rates, evapotranspiration, soil water content, and percolation are estimated on a daily basis by the hydrology component. The erosion component estimates erosion and sediment yield along with particle size distribution. Storm loads and chemical concentrations are estimated for runoff, sediment, and percolation fractions. Extensive model testing includes: for the hydrology component, 30 watersheds in 13 land resource areas; for the erosion component, 5 land resource areas; and for the chemistry component, 3 land resource areas. The computer program is efficient, costing only a few dollars for a year of calculations. (See also W81-02276) (Seigler-IPA)

OXYGEN-RICH GAS DOMES OF MICROBIAL ORIGIN IN THE SALT CRUST OF THE GREAT SALT LAKE, UTAH,
Utah Water Research Lab., Logan.
F. J. Post.
Geomicrobiology Journal, Vol 2, No 2, p 127-139, 1980. 4 Fig, 1 Tab, 13 Ref. OWRT-A-024-UTAH(7), 14-34-0001-6046.

Descriptors: Terminal lake, Halophilic, Nitrogen cycling, Protozoa, Drought, *Evaporation, *Chemical precipitation, *Sodium chloride, *Microbiology, Oxygen, *Great Salt Lake, Utah, *Gas domes, Dunaliella salina, D. viridis.

During the summer of 1977, a severe drought throughout the western part of the United States caused the north arm of the Great Salt Lake, Utah, to evaporate to its lowest level in a number of years, resulting in the precipitation of about 99.6% pure sodium chloride. At the extreme north end of the north arm, in the vicinity of Monument Point, low humidity combined with a shallow-bottom gradient to form a salt crust along the lake margin in which gas-emitting domes were common. The domes varied in size; each contained a large amount of gas that analysis showed to be 82 to 86% oxygen and 14 to 18% nitrogen, with <0.2% or no methane, and no detectable carbon dioxide. The bottom of the crust of the domes (3 to 4 cm thick) was a bright red color. Microscopic examination of this red zone revealed 3.5 x 10 sup 4 cells of Dunaliella salina, 2 x 10 sup 3 cells of D. viridis and 10 sup 8 to 10 sup 9 clumps of red halophilic bacteria per g of salt. Measurements in situ showed sufficient light (34 klx) and temperature (34C) under the salt to favor the growth of the algae and associated bacteria within the water phase of the crust or in water immediately underneath the crust. Oxygen produced as a result of algal photosynthesis was trapped under the crust until the crust was either eroded by waves or broken under pressure, releasing the gas. The domes were not observed during the summers of 1978 and 1979.

AVAILABILITY AND PLANT UPTAKE OF HEAVY METALS FROM CONTAMINATED DREDGED MATERIAL PLACED IN FLOODED AND UPLAND DISPOSAL ENVIRONMENTS,
Army Engineer Waterways Experiment Station, Vicksburg, MS. Environmental Lab.
C. R. Lee, B. L. Folsom, Jr., and R. M. Engler.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-173825, Price codes: A13 in paper copy, A01 in microfiche. In: Management of Bottom Sediments Containing Toxic Substances, Proceedings of the Fifth United States-Japan Experts Meeting, Nov. 1979, New Orleans, LA. Environmental Protection Agency Rpt. EPA-600/9-80-044, Sep. 1980. p45-59. 4 Fig, 6 Tab, 17 Ref.

Descriptors: *Heavy metals, *Bioassay, *Phytotoxicity, *Soil contamination, *Dredging, Waste disposal, Cadmium, Zinc, Arsenic, Bioaccumulation, Waste treatment, Channel improvement, *Sediments, Sampling, Testing procedures.

A solid-phase plant bioassay was used in an attempt to verify previous dredged material results and to develop a procedure that could indicate phytotoxicity and bioaccumulation of heavy metals in contaminated dredged material. Sediments known to be highly contaminated with one or more contaminants were collected from five freshwater locations in the Great Lakes and five saltwater locations in the U. S. The plant species used as indicators were Cyperus esculentus in the freshwater sediment tests and Spartina alterniflora and Distichlis spicata in the saltwater sediment tests. The bioassays indicated that greater uptake of cadmium and zinc occurred from dredged freshwater sediments in the upland disposal environment than from the flooded environment. The reverse was true for arsenic, with an increase in bioaccumulation and phytotoxicity observed in the flooded environment. Factors influencing the availability and plant uptake of the heavy metals include sediment redox potential, organic matter content, total sulfur content, and pH. (Brambley-SRC)

DISSOLVED OXYGEN AND TEMPERATURE SURVEY OF THE LOWER SUSQUEHANNA RIVER, AUGUST 9TH AND 10TH, 1979,
Susquehanna River Basin Commission, Harrisburg, PA.
S. E. Rudisill, and G. E. Senko.
Publication No 70, September, 1980. 71 p, 28 Fig, 6 Tab, 2 Append.

Descriptors: *Pennsylvania, *Dissolved oxygen, *Water temperature, *Rivers, *Dams, *Hydroelectric power, Reservoirs, Data collection, Water storage, Water quality, New York, Maryland, River basin commissions, Interstate commissions, River flow, *Susquehana River.

To evaluate and document the impact of three hydroelectric facilities--Conowingo, Holtwood, and Safe Harbor---on the Lower Susquehanna River, dissolved oxygen (DO) concentration and water temperature measurements were collected on August 9th and 10th, 1979, by the Susquehanna River Basin Commission in cooperation with state and federal agencies. The study area encompassed the lower forty miles of the Susquehanna River from Columbia, PA, to its mouth. A total of 31 transects were established between Columbia, PA, and the mouth of Susquehanna River at Havre De Grace, MD. Measurements were made at a minimum of three sites across each transect and at various depths at each site. In addition, measurements were made off both the upstream and downstream faces of Conowingo. The Maryland Department of Natural Resources provided data from their continuous recorder of DO and temperature on Bird Island at river mile 8.8 below Conowingo. No impacts on water temperature were observed; however, the investigator found that the three hydroelectric facilities and their associated reservoirs have created conditions that cause a significant decrease in DO concentrations from those found in the free-flowing river upstream of the impoundments. The lowest DO concentrations were found during periods of shutdown, but water quality standards cannot be maintained even during full generation below Conowingo. The most severe impacts on DO concentrations are found below Safe Harbor and Conowingo Dams, and the river begins to recover in the tidal areas below Deer Creek. A DO gradient occurs in front of all three dams; it is particularly severe in front of Conowingo. (Garrison-Omniplan)

ESTIMATION OF BACKGROUND LOADINGS AND CONCENTRATIONS OF PHOSPHORUS FOR LAKES IN THE PUGET SOUND REGION, WASHINGTON,
Geological Survey, Seattle, WA. Water Resources Div.
R. J. Gilliom.
Available from the OFSS, USGS Box 25425, Fed. Ctr., Denver, CO 80225, Price: $5.00 in paper copy, $3.50 in microfiche. Geological Survey Open-File Report 80-328, March, 1980. 37 p, 6 Fig, 2 Tab, 28 Ref.

Descriptors: *Estimating, *Phosphorus, *Lakes, *Washington, Model studies, Regression analysis, Eutrophication, Nutrients, Water quality, Land use, Puget Sound region(WA), Pacific Northwest.

For lakes in watersheds that include developed land, evaluation of eutrophication is facilitated by knowledge of changes in the lakes' phosphorus concentration since development. A method is described for estimating background phosphorus concentration in lakes of the Puget Sound lowland, Washington. Using a mass-balance 'Vollenweider-type' model, phosphorus loadings were calculated from present-day phosphorus concentrations measured in lake water and from easily measured physical characteristics for 24 lakes in undeveloped, or insignificantly developed, watersheds. Phosphorus loading from forest (undeveloped) land was derived for each lake as the difference between the calculated phosphorus loading directly to the lake's surface and loading by bulk precipitation (estimated from other studies). Forest-land loading to each lake was converted to the yield (mass per unit area) of the forested part of the watershed. The phosphorus yield from forest land was related to annual runoff, and the regression equation expressing this relationship explained 73% of the sample variance. By applying that regression equation to the appropriate annual-runoff data, the yield of phosphorus from forest land can be estimated for any lake in the study area. Phosphorus loading from forested land then can be added to direct loading by bulk precipitation to estimate background phosphorus loading for each lake. By applying the mass-balance model to calculated background loadings, background total-phosphorus concentration can also be calculated for all lakes in the study area that have stable thermal stratification during the summer. The standard error of estimate for calculated background loadings and concentrations averages about 25%. (USGS)

DEGRADATION OF THE HERBICIDE 2,4-D IN RIVER WATER - I. DESCRIPTION OF STUDY AREA AND SURVEY OF RATE DETERMING FACTORS,
Western Australia Univ., Nedlands. Dept. of Soil Science and Plant Nutrition.
H. J. Nesbitt, and J. R. Watson.
Water Research, Vol 14, No 12, p 1683-1688, December, 1980. 2 Fig, 2 Tab, 21 Ref.

Descriptors: *2,4-D, *Microbial degradation, *Nutrients, Phosphorus, Nitrogen, Biodegradation, *Australia, Spectrophotometry, Rivers, Sediment distribution, Temperature, Aquatic microorganisms, *Herbicides, Aquatic bacteria, Avon River.

Water samples taken from the Avon River at Walyunga National Park, Australia, were analyzed for their ability to degrade 2,4-D, a herbicide used extensively for noxious weed control along river banks and in agriculture in this country. Nutrient information and other water parameters were recorded, and measured amounts of river water sam-

ples were poured into sterilized bottles containing 1000 ppm 2,4-D sodium salt solutions. The bottles were capped and incubated at 25 degrees in the dark, and samples were drawn at periodic intervals and analyzed for 2,4-D levels by a Varian 635D Spectrophotometer. Results showed that 2,4-D biodegradation was dependent on the river water bacterial activity rather than on the total number or species of organisms present. The microbial activity was related primarily to the nutrient level of the river water and the distribution of the sediments. Concentrations of phosphorus and nitrogen, the two main nutrients, were so low that their effect on biodegradation was uncertain. More research on the effects of temperature and nutrient levels on the biodegradation of 2,4-D was recommended. (Geiger-FRC)
W81-02152

DEGRADATION OF THE HERBICIDE 2,4-D IN RIVER WATER - II. THE ROLE OF SUSPENDED SEDIMENT, NUTRIENTS AND WATER TEMPERATURE,
Western Australia Univ., Nedlands. Dept. of Soil Science and Plant Nutrition.
H. J. Nesbitt, and J. R. Watson.
Water Research, Vol 14, No 12, p 1689-1694, December, 1980. 5 Fig, 1 Tab, 9 Ref.

Descriptors: *2,4-D, *Microbial degradation, *Nutrients, *Temperature, Biodegradation, Phosphorus, Seasonal, Rivers, Australia, *Herbicides, Nitrogen, Sediment load, Carbon, Aquatic bacteria, Path of pollutants.

Previous studies on the biodegradation of 2,4-D in the Avon River, Australia, have shown that the rate of the degradation is influenced by the nutrient level of the river water, the dissolved organic carbon content, and the sediment load. Phosphorus levels were correlated with sediment load, but no relationship was found between sediment load and nitrogen levels nor between bacterial numbers, sediment load and 2,4-D half life. The effects of each of these factors and of temperature on the proliferation of 2,4-D metabolizing microorganisms were examined. When sediments and inorganic nutrients were added to river water samples spiked with 2,4-D, the rate of degradation of the herbicide increased. Additions of microorganisms involved in the degradation process did not significantly enhance the breakdown of 2,4-D, suggesting that the 2,4-D degradation rate was independent of the availability of organisms capable of degrading the herbicide. During the winter months in Australia, the river temperature may fall below 11 degrees, which is well below the optimum for bacterial activity. It was speculated that influxes of 2,4-D into the river during this season would probably be carried, with little degradation, into the river estuary. (Geiger-FRC)

A REACTOR NETWORK MODEL OF THE PASSAIC RIVER,
Rutgers - The State Univ., New Brunswick, NJ.
R. C. Ahlert, and S-F. Hsueh.
Ecological Modelling, Vol 10, p 47-61, June, 1980. 7 Fig, 4 Tab, 9 Ref.

Descriptors: *Mathematical models, *Dispersion, *Rivers, Tracers, *Path of pollutants, Networks, Statistical models, Water quality, New Jersey, Tracking techniques, *Passaic River.

A modelling concept based on a network of ideal reactor elements is illustrated with tracer data for the Passaic River (New Jersey). During model construction, two ideal reactors were considered which were extreme types in terms of mixing and dispersion phenomena. The plug-flow tubular reactor was a pure time delay with dispersion completely absent. The continuous stirred tank reactor was an instantaneously mixed system with dispersion at a maximum. Trail network configurations were evaluated using Parseval's theorem and applying a least-squares procedure. Time-of-travel measurements were performed independently on consecutive tidal segments of the Passaic River from Little Falls to the Outwater Lane Bridge. Four possible models were evaluated using the data. The resulting network model has applications to water quality management if mixing is important and leads to residence-time distributions varying from the mean or nominal time-of-travel. (Small-FRC)
W81-02195

CONCENTRATIONS OF PU-239,240, CS-137, AND SR-90 IN THE WATERS OF THE LAURENTIAN GREAT LAKES, COMPARISON OF 1973 AND 1976 VALUES,
Savannah River Ecology Lab., Aiken, SC.
J. J. Alberts, and M. A. Wahlgren.
Environmental Science and Technology, Vol 15, No 1, p 94-98, January, 1981. 7 Tab, 11 Ref.

Descriptors: *Great Lakes, *Radioisotopes, Strontium, Plutonium, Cesium, *Fallout, *Water pollution, Pollutant identification, Lakes, Lake Erie, Lake Huron, Lake Ontario, Lake Michigan.

Concentrations of plutonium-239,240, cesium-137, and strontium-90 were measured in four of the Great Lakes in 1973 and 1976. Sr-90 concentration (0.82-1.28 pCi per liter) remained constant in all lakes. Pu-239,240 concentrations for Lake Michigan were (in fCi per liter) 0.69 in 1973 and 0.49 in 1976; Cs-137 was 40 in 1973 and 56 in 1976. Lake Huron concentrations were Pu-239,240, 0.93 to 0.98 in 1973 and 0.88 to 1.03 in 1976; Cs-137, 39-44 in 1973 and 31.3 to 37.6 in 1976. Lake Erie levels of Pu-239,240 were 0.16 to 0.24 in 1973 and 0.11 to 0.19 in 1976; Cs-237, 15 to 22.5 in 1973 and 10.4 to 26.3 in 1976. Lake Ontario levels were Pu-239,240, 0.24 in 1973 and 0.04 to 0.35 in 1976; Cs-137, 26 to 29 in 1973 and 25.1 to 36.4 in 1976. Studies of the submicrometer particle size and charge characteristics of Pu-239,240 showed that it is a simple anionic complex or is associated with particles smaller than 30 Angstroms and negatively charged. KINETIC STUDY OF THE BIODEGRADATION OF BIPHENYL AND ITS MONOCHLORINATED ANALOGUES BY A MIXED MARINE MICROBIAL COMMUNITY,
Alaska Univ., Fairbanks. Inst. of Marine Science.
P. B. Reichardt, B. L. Chadwick, M. A. Cole, B. R. Robertson, and D. K. Button.
Environmental Science and Technology, Vol 15, No 1, p 75-79, January, 1981. 1 Fig, 6 Tab, 24 Ref.

Descriptors: *Biodegradation, *Organic compounds, *Microbial degradation, *Coastal waters, Biphenyl, Estuaries, Sea water, Path of pollutants, Water pollution, *Alaska, Chlorinated biphenyls.

Biphenyl was more rapidly biodegraded by a microbial community from Alaskan coastal waters than were its monochloro derivatives. Relative maximal rates expressed on a molar basis were: biphenyl 1.0, 2-chlorobiphenyl 0.40, 3-chlorobiphenyl 0.27, and 4-chlorobiphenyl 0.33. The rate of biodegradation for biphenyl was 9.3 to 9.8 nmol per liter per day. Biphenyl and its compounds did not form significant amounts of intermediates, but degraded completely to CO2. Turnover time for monochlorobiphenyls in an Alaskan esturay was estimated to be 1 year at a level of 0.1 micrograms per liter. (Cassar-FRC)
W81-02199

BEHAVIOR OF RADIUM AND BARIUM IN A SYSTEM INCLUDING URANIUM MINE WASTE WATERS AND ADJACENT SURFACE WATERS,
Technical Univ. of Prague (Czechoslovakia). Dept. of Nuclear Chemistry.
R. Sebesta, P. Benes, J. Sedlacek, J. John, and R. Sandrik.
Environmental Science and Technology, Vol 15, No 1, p 71-75, January, 1981. 1 Fig, 3 Tab, 16 Ref.

Descriptors: *Uranium, Radium, Barium sulfate, *Sedimentation, Mine water, Chemical precipitation, Surface waters, *Waste water treatment, *Mine wastes, Water pollution, Path of pollutants, Industrial wastes, Chemical reactions, Suspended solids, Ion exchange, Cation exchange.

Investigation of uranium mine waste water purification in a typical system showed that ion exchangers removed an average of 87% of the radium but functioned variably. Subsequent barium sulfate precipitation was insufficient--76% average efficiency. Waste water was sampled at 8 locations in the process stream, from ion exchange influent to upstream and downstream from the outfall. Ra concentration (in picograms per liter) was highest before sedimentation (but after ion exchange): 331-2181 dissolved and 65-2729 particulate. Values before and after ion exchange were 265-380 dissolved and 1.6-7.5 particulate and 14-59 dissolved, 0.6-11.0 particulate respectively. Ra levels in water samples from the outlet of the sedimentation pond and in various places downstream were in the range 2.9-19 dissolved and 6.9-227 particulate. The main factors influencing levels and forms of Ra and Ba in surface waters were dilution with river water and sedimentation of particulates in the river. Ra and Ba behaved similarly throughout the system. The predominant particulate form in the water was Ba(Ra)S04. (Cassar-FRC)

TRACE ORGANICS IN GROUNDWATER,
Stanford Univ., CA. Dept. of Civil Engineering.
P. L. McCarty, M. Reinhard, and B. E. Rittmann.
Environmental Science and Technology, Vol 15, No 1, p 40-48, 51, January, 1981. 9 Fig, 4 Tab, 16 Ref.

Descriptors: *Organic compounds, *Groundwater, *Path of pollutants, Biodegradation, Sorption, Water pollution, Aquifers, Bacteria.

The movement and fate of trace organic compounds in groundwater are governed largely by sorption and biodegradation. Sorption can affect the rate of travel of the contaminants with respect to that of water and allow accumulation on subsurface solid media. The octanol/water partition coefficient is a useful value to predict relative retention times. Predicted and measured values for chloroform, chlorobenzene, and 1,4-dichlorobenzene agreed well. Further research is needed on the interaction of organic matter with inorganic surfaces and on the interaction of the many different aquifer components. Biofilm models are useful to predict biodegradability. The minimum concentration at which a single organic material may be biodegraded under steady-state conditions depends on growth and decay coefficients of the bacteria, which are in turn dependent on temperature, pH, species, and available electron acceptors. Relatively little is known about the kinetics of degradation of mixed substances at low concentrations and the nature of the intermediate substances formed. (Cassar-FRC)

AIRBORNE ORGANIC CONTAMINANTS IN THE GREAT LAKES ECOSYSTEM,
Minnesota Univ., Minneapolis
S. J. Eisenreich, B. B. Looney, and J. D. Thornton.
Environmental Science and Technology, Vol 15, No 1, p 30-38, January, 1981. 2 Fig, 10 Tab, 42 Ref.

Descriptors: *Water pollution sources, *Air pollution effects, *Great Lakes, Polychlorinated biphenyls, *Organic compounds, Pesticides, Path of pollutants, Precipitation, Food chains, Lakes, Surface waters, Polynuclear aromatic hydrocarbons, Industrial wastes.

Pollution of the Great Lakes by airborne organic contaminants is significant and leads to accumulation in the food chains because, with the exception of Lake Erie, concentrations of suspended solids

available for pollutant removal are less than 1 mg per liter. In addition, major pollution sources are upwind, surface areas and surface area to basin ratio are large, water and chemical residence times are long, and redistribution occurs through mixing. Trace organics in the air may enter the water by adsorption onto particulate matter, partitioning across the air-water interface, wet deposition through rain and snow, and dry deposition by aerosols. A table lists total annual deposition of airborne trace organics to each of the 5 Great Lakes for polychlorinated biphenyls (PCB), several pesticides, and several polynuclear aromatic hydrocarbons. The chemical with most information available is PCB. Total sources in Lake Superior are estimated at 8,000-9,700 kg per year, with 6,600-8,300 of this coming from the atmosphere. Sinks are 1,100-1,700 kg per year, leaving an annual addition of 6,300-8,000 per year. Water concentration is increasing at the rate of 0.1-0.5 ng per liter per year. Although PCB production was prohibited in 1979 and their disposal was regulated, PCBs are widespread in the environment and are capable of codistillation, volatilization from landfills and incomplete incineration. (Cassar-FRC)

TETRACHLOROETHYLENE CONTAMINATION OF DRINKING WATER BY VINYL-COATED ASBESTOS-CEMENT PIPE,
Woods Hole Oceanographic Insitution, MA.
S. G. Wakeham, A. C. Davis, R. T. Witt, B. W. Tripp, and N. M. Frew.
Bulletin of Environmental Contamination and Toxicology, Vol 25, No 4, p 639-645, October, 1980. 1 Fig, 2 Tab, 17 Ref.

Descriptors: *Potable water, *Pipes, Vinyl, Asbestos cement, Analytical techniques, Public health, *Water pollution, Sampling, Organic compounds, Water quality, Water purification, *Tetrachloroethylene, Plastics, Coatings.

A preliminary study to assess tetrachloroethylene contamination of drinking waters flowing in vinyl-coated asbestos-cement pipes was conducted in Falmouth, Massachusetts. Tetrachloroethylene is used as the solvent during application of the vinyl coating to the piping in order to prevent asbestos fibers from entering the water. Data was obtained from a survey of the town's water distribution system in a pipe flushing and recovery experiment. Levels of tetrachloroethylene ranged from 140 to 18,000 ppb in unflushed pipes, yet were less than 2 ppb in other parts of the town's system. As long as tetrachloroethylene contamination was occurring, no amount of flushing reduced contamination downstream. Measurements at one sampling area suggest that tetrachloroethylene may continue to leach out of pipes for 5 to 8 years after installation. (Titus-FRC)

RELATIONSHIPS BETWEEN FORMS OF NITROGEN AND HYDROLOGICAL CHARACTERISTICS IN A SMALL STREAM NEAR ADELAIDE, SOUTH AUSTRALIA,
Adelaide Univ. (Australia). Centre for Environmental Studies.
A. N. Holmes, W. D. Williams, and G. Wood.
Australian Journal of Marine and Freshwater Research, Vol 31, No 3, p 297-317, June, 1980. 10 Fig, 8 Tab, 38 Ref.

Descriptors: *Nitrogen compounds, *Streamflow, *Base flow, Storm runoff, Nutrients, Adelaide, *Australia, Nitrates, Flow, Discharge(Water), Agriculture, Variability, Regression analysis, Water pollution sources.

Concentrations of nitrogen compounds in various forms were related to flow characteristics of a small stream draining an agricultural area near Adelaide, South Australia. During baseflow, nitrate-nitrogen was predominant, 4.34 mg per liter. Ammonium-nitrogen was 0.06; filtered total Kjeldahl nitrogen (TKN), 0.23; TKN, 0.62; and total nitrogen, 4.97 (all values are in mg per liter). Stormflow showed TKN dominant, 8.20; filtered TKN, 1.14; nitrate-nitrogen, 3.81; ammonium-nitrogen, 0.49; and total nitrogen, 11.85. No relationship existed between concentrations of nitrate-nitrogen and discharge in the baseflow range. For the TKN fraction there was a relationship between concentration-discharge and load-discharge plots, but four abnormally high values affected the correlations. An annual total nitrogen load of 9.9 tons or 24.2 kg per hectare per year (1976-77) was calculated. Reduced nitrogen (measured as TKN) and nitrate-nitrogen were 7.8 and 16.4 kg per hectare per year respectively. (Cassar-FRC)

HYDROCHEMICAL CHARACTERISTICS AND POLLUTION OF THE RIVER BIALA PRZEMSZA CATCHMENT BASIN,
Jagellonian Univ., Krakow (Poland). Dept. of Hydrobiology.
K. Jop.
Acta Hydrobiologica, Vol 22, No 2, p 179-190, 1980. 1 Fig, 2 Tab, 22 Ref.

Descriptors: *Heavy metals, *Watersheds(Basins), *Biala Przemsza River, *Water pollution effects, *Industrial wastes, Path of pollutants, Bottom sediments, Water quality, *Poland, Zinc, Iron, Copper, Lead, Cadmium, Nickel, Domestic wastes, Basins, Wastes, Metals, Sodium, Sulfates, Chlorides, Organic wastes, Self-purification, Pulp wastes.

Contaminants and the basic chemical composition of water and sediments in the River Biala Przemsza, Poland, basin were determined at 16 stations 9 times throughout 1977. Municipal and industrial wastes are discharged into various tributaries. In polluted sections of the river, carbonates were lower and sulfates, chlorides, and sodium higher. The municipal wastes added great quantities of nitrogen and phosphorus compounds and produced increases in BOD downstream from the sewer outfalls. Downstream, the self-purification process caused gradual increases in oxygenation and decreases in organic matter and all elements investigated. Heavy metals precipitated from the water, chiefly with ferric hydroxides. However, ammonia, organic nitrogen and total phosphorus remained high, and sediments contained increased amounts of heavy metals. Three types of water were seen in the catchment basin. The most pure water contained (in ppb) Cd, 0; Pb, 0-30; Cu, 0-51; Ni, 0-15; Zn, 93-330; and Fe, 105-215. Bottom sediments contained (in ppm) Cd, 0-3; Pb, 20-263, Cu, 16-55; Ni, 16-44; and Zn, 9-93. Water in the more contaminated area contained 3 to 5 times these levels of metals, and sediments, 4 to 6 times, with the exception of Zn, 16 times. Water in the most contaminated area contained (in ppb) Cd, 0-5; Pb, 25-78; Cu, 5-35; Ni, 6-18; Zn, 340-1572; Fe, 107-3095. Bottom sediment contained (in ppm) Cd, 0-89; Pb, 93-3367; Cu, 25-931; Ni, 2-152; and Zn, 123-1448. Since the time when similar determinations had been performed, in 1971-1972, the mean concentration of metals has doubled. (Cassar-FRC)

THE MANAGEMENT OF THE CATCHMENT AREA OF THE GOCZALKOWICE RESERVOIR AND ITS EFFECT ON THE AMOUNT OF NITROGEN AND PHOSPHORUS MIGRATION FROM IT,
Polish Academy of Sciences, Pszcyna. Lab. of Water Biology.
H. Kasza.
Acta Hydrobiologica, Vol 22, No 1, p 37-53, 1980. 4 Fig, 3 Tab, 31 Ref.

Descriptors: *Runoff, *Phosphorus compounds, *Nitrogen compounds, *Reservoirs, *Watersheds(Basins), Goczalkowice reservoir, Regression analysis, Phosphates, Sewage, Water pollution sources, Municipal wastes, Fertilizers, Nutrients, *Poland.

Calculations of the runoff per unit of nitrogen and phosphorus in waters of the Goczalkowice Reservoir catchment area, Poland, showed the degree of anthropogenic influence. The nutrient levels in annual mean runoff in the 3 rivers investigated were: inorganic nitrogen, 1.173 grams per cu meter per year, Vistula; 0.484, Bajerka River; and 0.182, Knajka River. These are within the limits adopted for oligotrophic catchment areas. Total phosphorus levels averaged 0.028 grams per cubic meter, and phosphates, 0.011 grams per cubic meter for each river. General observations were that woodlands, particularly oak and birch, contributed a greater amount of inorganic nitrogen than farm lands and green areas. No correlation was evident between intensity of fertilizer use and concentration of inorganic nitrogen in runoff waters. Phosphorus seemed to be absorbed while rivers flowed over wooded terrain, whereas farm areas contributed phosphorus to the total runoff. Sewage was responsible for 55-58% of the phosphorus entering the reservoir; the remainder came from eroded soil and groundwaters. (Cassar-FRC)

HETEROTROPHIC MICROFLORA OF THE RESERVOIR AT LUBACHOW. 2. VERTICAL DISTRIBUTION OF BACTERIA PREDOMINATING IN THE RESERVOIR AT LUBACHOW IN THE ANNUAL CYCLE,
Instytut Inzynierii Ochrony Srodowiska Politechniki Slaskiej, Gliwice (Poland).
M. Pawlaczyk-Szpilowa, H. Sztajer, and D. Leszczynska.
Acta Hydrobiologica, Vol 22, No 1, p 13-27, 1980. 2 Fig, 5 Tab, 14 Ref.

Descriptors: *Bacteria, *Lubachow, *Reservoirs, *Municipal wastes, Sewage, Microorganisms, Aquatic bacteria, Water pollution effects, *Poland, Biological oxygen demand, Pollutants, Path of pollutants, Bacillus, E. coli, Pseudomonas.

Heterotrophic bacteria, numerous in polluted waters, were studied in a vertical water column 28 meters deep in a reservoir at Lubachow, Poland, with respect to thermal and chemical characteristics of the water from May 1973 to January 1974. The most prevalent bacterium was Bacillus, a genus able to utilize a wide variety of organic substrates and resist toxins and oxygen deficit. In winter, conditions at the bottom were less toxic and more oxygenated, and Pseudomonas prevailed. In spite of the constant flow of domestic sewage to the reservoir, Escherichia were not present. The lowest BOD5 values were observed at the bottom, where the heaviest pollution load always occurred. With the course of time this condition moved higher in the water column. Subsequently, the water circulation in the reservoir increased, and oxygen, pollution, and nutrients became more equalized throughout the water column. (Cassar-FRC)

POLIOVIRUS INTERACTION WITH MONTMORILLONITE CLAY: ELECTRON MICROSCOPY AND FLOCCULATION STUDIES,
California Univ., Los Angeles. Dept. of Engineering and Applied Science.
P. C. Butler.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-182222, Price codes: A05 in paper copy, A01 in microfiche. MS Thesis in Engineering, 1980. 78 p, 18 Fig, 6 Tab, 3 Append. (California Water Resources Center Project UCAL-WRC-W-523). OWRT-B-184-CAL(9).

Descriptors: *Viruses, *Water reuse, *Soil properties, *Groundwater, Adsorption, Water pollution.

The objective of this research was to gain an understanding of the interaction between montmorillonite clay particles and Type I poliovirus particles. This knowledge would be useful in the quantification of viral contamination of underground water reservoirs left after land treatment of waste water. Two topics were investigated: first, an attempt was made to photograph virus adsorbed on monodispersed clay particles; second, determination of the concentrations of clay, virus, and electrolyte which allowed the maintenance of monodispersed clay particle suspension was made. A drop of clay-virus suspension in an aqueous solution of ammonium bicarbonate, a volatile salt, was air-dried on an electron microscope sample holder. The samples were coated with gold, gold-palladium, or carbon to promote conductivity. Scanning electron micrographs were taken of the surface of clay particles. The micrographs showed virus attached to the edge of the plate-shaped clay particle. A count of viruses adsorbed on clay gave an average of 0.156 + or - 0.02 virus particles per clay particle. In the second study, suspensions containing variable concentrations of virus, clay and phosphate buffered saline (PBS) electrolyte were prepared and photomicrographs were taken to ascertain the extent of clay flocculation. Monodispersed clay suspensions were obtained only in suspensions containing the highest virus concentration tested. (Snyder-California)

POLIOVIRUS TYPE I ADSORPTION TO CRUSHED OTTAWA SAND AT HIGH TITRES.
California Univ., Los Angeles. Dept. of Engineering.
J. C. Fong.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-182263, Price codes: A04 in paper copy, A01 in microfiche. MS Thesis in Engineering, 1980. 54 p, 4 Fig, 4 Tab, 4 Append. (California Water Resources Center Project UCAL-WRC-W-523). OWRT-B-184-CAL(8).

Descriptors: *Viruses, *Reclaimed water, Soils, Percolation, Sands, Water reuse, *Groundwater, Adsorption, *Soil properties, Mathematical models.

This thesis investigates the removal capacity of crushed Ottawa sand for poliovirus type I (Sabin strain). The need for this study arises from the possible survival and transmission of enteric viruses from reclaimed water through soil beds which may contaminate the groundwater supply. Sand was studied because it is a very common soil constituent. Characterization of the sand was achieved by photomicroscopy using a truncated multiple traversing technique. The particle size distribution fitted a normal distribution with an average Feret's diameter of 122.9 mu. The removal of poliovirus by the sand conformed to a Langmuir isotherm of which the parameters were found to be Q=2.74E+08 virus sites per mg of adsorbent and an adsorption equilibrium constant of 1.51E-08. The percentage of surface area utilized for virus adsorption was calculated to be 1.35% from the parameters found. This low percentage is believed to be because virus attachment is along the edge surfaces. (Snyder-California)

NONPOINT POLLUTION DATA COLLECTION PROBLEMS ON LOW FLAT COASTAL TOPOGRAPHY.
Delaware Univ., Newark. Dept. of Agricultural Engineering.
K. M. Lomax, J. C. Stevenson, M. S. Christy, and J. R. Todd.
In: Nonpoint Pollution Control -- Tools and Techniques for the Future, Proceedings of a Technical Symposium, p 46-52, 1981. 1 Tab, 9 Ref

Descriptors: *Maryland, *Eastern Shore, *Nonpoint pollution sources, *Surface runoff, *Agricultural runoff, Forests, Small watersheds, Topography, Land use, Coastal plains, Tidal effects, Flow measurement, Flowmeters, Groundwater movement.

Pollution contribution from nonpoint sources was studied using data gathered from an agricultural watershed and from a forested watershed on Maryland's Eastern Shore. The agricultural watershed had 54 hectares of cropland and 32 hectares of roads, grass, ditches, and woods. The forested watershed had 33 hectares of 50 year old loblolly pines with no significant roads, houses, grass, or ditches. The flatness of the area made flow and watershed boundary determinations very difficult. Ditch patterns were found to control surface water flow and visual observation during a flow event was finally used to define the watersheds. Problems were also experienced during flow measurement with Parshall flumes due to their inability to measure small flows. Runoff measurement was further complicated by tidal effects and by the relatively high concentration of chloride in the groundwater. Due to the lowness of the watersheds, about 290 groundwater wells were drilled to study the hydrologic patterns of the area. Three years of measurements showed that as expected the forested watershed had less surface water runoff than did the agricultural watershed. Also, direct groundwater movement did not appear to be a significant hydrologic factor. (See also W81-02276) (Seigler-IPA)

NONPOINT SOURCES AND IMPACTS IN A SMALL COASTAL PLAIN ESTUARY: A CASE STUDY OF THE WARE RIVER BASIN, VIRGINIA.
Virginia Inst. of Marine Science, Gloucester Point. G. Anderson, and C. Bosco.
In: Nonpoint Pollution Control -- Tools and Techniques for the Future, Proceedings of a Technical Symposium, p 53-63, 1981. 2 Fig, 2 Tab, 26 Ref.

Descriptors: *Virginia, *Ware River, *Chesapeake Bay, *Storm runoff, Surface runoff, *Nonpoint pollution sources, Agricultural runoff, Forests, Urban runoff, Estuaries, Coastal plains, Topography, Land use, Rural areas, Infiltration, Average runoff.

The Ware River, a mesohaline sub-estuary located on the southwestern shore of the Chesapeake Bay, was used to study the characteristics of runoff from low relief coastal plain environments and their impacts on small estuarine receiving waters. The Ware basin is a small drainage area of 59.4 sq miles with rural land use. Four small drainage catchments were studied, a residential site, a forested site, and two agricultural sites. Eight months of runoff data showed runoff rates for the four sites to be well above average with runoff from the residential site being ten times more than the long term average. Loading values for various chemical constituents were lower than expected. The residential site produced the highest loads and the upland agricultural site produced the lowest areal loads. Loading rates appeared to be dependent on the areal water yield of each catchment except for the forested site. Results also indicate that the extent, duration, and severity of impacts on the estuarine Ware River following a major storm are slight. (See also W81-02276) (Seigler-IPA)

Descriptors: *Howard County, Maryland, *Nonpoint pollution sources, *Rainfall runoff relationships, *Agricultural watersheds, Surface runoff, Phosphorus, Water quality, Water sampling, Monitoring, Land use, Alfalfa, Corn(Field), Demonstration watersheds, Cattle, Hogs

Runoff quality and quantity were monitored for the following land use areas in Howard County, Maryland: conventional tilled corn, minimum tilled corn, alfalfa, swine grazing, and cattle grazing. Watersheds monitored were selected so that each represented a single land use activity. H-type flumes with Stevens type F water stage recorders were used to measure runoff. Meteorological data recorded included pan evaporation, wind run, temperature, rainfall, humidity, and solar radiation. Nutrient and sediment loading rates were calculated using nutrient and sediment concentrations from stage integrated samplers and volumes from water stage recorders. Results show that minimum tillage is effective in reducing sediment loss as illustrated by the corn watersheds and areas with good surface cover. All watersheds showed fairly constant soluble phosphorus concentrations in runoff during the entire growing season. Most phosphorus appears to be sediment. The tilled corn watershed had the highest sediment concentration and the highest phosphorus concentration. Highest total phosphorus values were found during August and September. EVALUATION OF URBAN STORMWATER QUALITY AND NONSTRUCTURAL BEST MANAGEMENT PRACTICES.
Philadelphia Water Dept., PA
W. G. Richards, J. E. Shwop, and R. Romano
In: Nonpoint Pollution Control -- Tools and Techniques for the Future, Proceedings of a Technical Symposium, p 82-99, 1981. 4 Fig, 8 Tab, 13 Ref

Descriptors: *Philadelphia, Pennsylvania, *Urban runoff, *Nonpoint pollution sources, *Storm runoff, Urbanization, Street cleaning, Land use, Residential areas, Industries, Data bases, Best Management Practices, Suspended solids, Water pollution sources

Two urban stormwater sampling programs were conducted along with a detailed study of street cleaning and stormwater in Philadelphia, Pennsylvania, to analyze the effects of land use and best management practices on nonpoint sources of water pollution in urban areas. The first study characterized stormwater loads according to nine uniform land use types to provide a data base for stormwater loading projections and for estimating total nonpoint urban stormwater loads. Industrial and commercial areas were found to have greater input during storm events than residential areas, however, housing density in residential areas was a significant factor. A comparison of the data bases from the first study and from the second study which used a mixed land use basin showed that projected storm loads for most parameters were within a factor of two from the measured values

Two non-structural methods for controlling urban stormwater, street cleaning and inlet basin cleaning, were examined. Street cleaning produced a 30% reduction in pollutant loadings while inlet basin cleaning produced a 780% increase in suspended solids load immediately after cleaning. Recommendations for changing inlet basin cleaning methods were made. (See also W81-02276) (Seigler-IPA)

In: Nonpoint Pollution Control -- Tools and Techniques for the Future, Proceedings of a Technical Symposium, p 107-118, 1981. 2 Fig, 1 Tab, 27 Ref.

Descriptors: *Vermont, *Nonpoint pollution sources, *Dairy farms, *Computer models, Model studies, Manure, Agricultural runoff, Nutrients, Environmental effects, Farm wastes, Livestock, Cattle, Erosion, Sedimentation.

A linear programming model of an individual dairy farm was constructed to assess the environmental and financial impacts of nonpoint control measures used on dairy farms in Vermont. It is estimated that dairy farms account for most of the nonpoint nutrient load from Vermont agriculture due to runoff of nutrients from animal manure and commercial fertilizer. The model can be used to simulate alternative nonpoint control methods so that their impact, on nutrient losses and change in farm income, can be compared to a base situation. The model operates in a single year period and emphasizes short-run profit maximizing. Three simulating components are used: dairy operations, financial results, and resource and environmental results. Dairy operations include herd management, herd feeding, crop production, and manure handling. Resource and environmental results separates potential pollutants into erosion and sedimentation or nutrients. Financial components include: current income and expenses, debt structure, and taxes and subsidy programs. (See also W81-02276) (Seigler-IPA)

Descriptors: *Nonpoint pollution sources, *Virginia, *Land use, *Agricultural runoff, *Water pollution sources, Management practices, Sediments, Erosion, Agricultural watersheds, Occoquan watershed, Grazing, Pasture management, Corn(Field), Watershed management.

Six sites in the Occoquan watershed were monitored to characterize nonpoint pollution from various land uses and to evaluate the effectiveness of selected management practices. The study sites were located in Prince William and Fauquier Counties, Virginia. Four of the sites were agricultural and were paired as heavily grazed and lightly grazed, and as minimum-till and no-till corn croplands. Other sites monitored were effluent from a farm stock pond and drainage from a small hardwood forest. All sites were equipped with type-H flumes for primary flow control along with pressure transducer type flowmeters. Samples were collected automatically during storm events and were analyzed for: total suspended solids, total Kjekdahl nitrogen, soluble Kjeldahl nitrogen, ammonia nitrogen, nitrate plus nitrite nitrogen, soluble orthophosphorus, total soluble phosphorus, and total phosphorus. Results show that the heavily grazed area consistently exported more pollutants than the lightly grazed area. No-till corn, in general, produced lower concentrations than the minimum-till corn. Extreme events did produce higher loading at the no-till site than at the minimum-till site. (See also W81-02276) (Seigler-IPA)

Descriptors: *Polychlorinated biphenyls, *Dredging, *Sediments, *Environmental effects, *Estuaries, Puget Sound(WA), Duwamish River(WA), River beds, Water pollution, Suspended solids, Marine animals, Clams, Worms, Crustaceans, Statistics, *Washington.

Short-term and long-term ecological impact studies were initiated at the time of open-water disposal of contaminated dredged material from the Duwamish River in Elliott Bay, Puget Sound, Washington. The experimental disposal site was located at a depth of 60 m in a marine estuary with generally weak circulation. Approximately 114,000 cubic meters of dredged material contaminated with PCB's were dumped at the site from split-hull barges. Replicate water, suspended particulate matter, and sediment samples were taken at intervals up to 9 months after disposal and investigated for PCB content. The PCB concentration in water and suspended matter generally declined over time. The sediments at the disposal site were slumping from the center of the site to the periphery during the monitoring period, and there was a slight but not significant reduction in PCB concentrations. Long-term (3-years post-disposal) PCB concentrations showed further declines, with the highest concentrations in the vicinity of the disposal site. Macrofauna, including marine worms, clams and crustaceans, was collected by grab sampler. Statistical analysis of the abundance figures suggest that some taxa may be more abundant within and close to the disposal site, and that stations in close proximity to the grid are more similar to each other than to more distant stations. Nonparametric Wilcoxon two-sample tests revealed significant differences in abundances for none taxa that were grouped as stations within the grid site versus more distant stations. All but one of the taxa exhibited greater abundances at the disposal site. (Brambley-SRC)

Descriptors: *Water quality control, *Dredging, *Waste disposal, *Settling basins, *Suspended solids, Heavy metals, Estuaries, Lakes, Rivers, Pesticides, Plant growth, Water quality standards, Sediments, River beds, Polychlorinated biphenyls, Ammonia.

Nine dredged material land containment areas, located at upland, lowland and island sites, were monitored during hydraulic dredging operations in fresh and brackish-water riverine, lake, and estuarine environments. Influent-effluent sampling at the diked disposal areas showed that, with proper retention of suspended solids, most chemical constituents could be removed to near background water levels. Most heavy metals, oil and grease, chlorinatd pesticides, and PCB's were almost totally associated with solids in influent and effluent samples. Ammonia, manganese, total mercury and possibly iron, copper and zinc are the only contaminants which may occasionally exceed background water levels and present water quality standards after suspended solids removal. Actively growing vegetation appeared to be efficient in reducing ammonium nitrogen to low levels and for filtering out suspended solids. Confined land disposal of dredged material seems to be a viable method for the containment and treatment of most contaminated sediments, but effluent monitoring and predictive testing methodologies should include suspended solids. QUALITY OF RUNOFF FROM SMALL WATERSHEDS IN THE TWIN CITIES METROPOLITAN AREA, MINNESOTA--A PROJECT PLAN,
Geological Survey, St. Paul, MN. Water Resources Div.
M. A. Ayers, G. A. Payne, and G. L. Oberts.
Available from the OFSS, USGS Box 25425, Fed. Ctr., Denver, CO 80225. Price: $ 2.00 in paper

copy, $3.50 in microfiche. Geological Survey Open-File Report 80-592, 1980. 31 p, 13 Fig, 6 Tab, 7 Ref.

Descriptors: *Water quality, *Storm runoff, *Small watersheds, *Urban hydrology, *Minnesota, Land use, Water pollution sources, Water supply, Analytical techniques, Data collections, Sampling, Water analysis, Sediments, Nutrients, *Twin Cities metropolitan area(MN).

A program for water-quality sampling to define the relationships between land use, watershed characteristics, and the quantity, quality, and timing of runoff has been started for the Twin Cities metropolitan area of Minnesota. Ten major watersheds were chosen as representative of conditions in the metropolitan area. Each will be sampled at one location near the outlet. Six of the watersheds are agricultural, and range in size from 14.3 to 82.9 square miles. The four remaining watersheds are urbanized and range in size from 1.22 to 31.7 square miles. In addition, seven urban subwatersheds, which range in size from 0.12 to 0.47 square mile and reflect a dominant land-use type, will be sampled. Data collection is designed around the hydrologic conditions expected for each site. Sixteen of 17 sites are instrumented to define stream discharge and 12 sites have automatic water samplers and recording rain gages. In addition, six sites will have automatic wetfall/dryfall precipitation collectors. Samples for analysis of 32 chemical, physical, and biological constituents will be collected at varying frequencies, with emphasis on storm sampling for suspended solids and nutrients. A data-management system being designed for the U.S. Geological Survey Urban Hydrology Studies Program will facilitate data processing. Data interpretation will be aimed at defining the quantity and quality characteristics of runoff from study watersheds. These findings will be extrapolated to unsampled watersheds in the metropolitan area. (USGS)

WATER-QUALITY RECONNAISSANCE OF THE PASCAGOULA AND ESCATAWPA RIVERS, JACKSON COUNTY, MISSISSIPPI-MAY 1974 TO JULY 1978,
Geological Survey, Doraville, GA. Water Resources Div.
R. E. Faye.
Available from the OFSS, USGS Box 25425, Fed. Ctr., Denver, CO 80225, Price: $14.00 in paper copy, $3.50 in microfiche. Geological Survey Open-File Report 80-727, 1980. 105 p, 15 Fig, 4 Tab, 6 Ref.

Descriptors: *Water quality, Surveys, *Data collections, *Mississippi, *Estuaries, Streamflow, Waste water, Water pollution sources, Tidal waters, Biochemical oxygen demand, Nutrients, Trace elements, Nitrification, Water analysis, Hydrologic data, Pascagoula River(MS), Escatawpa River(MS), *Jackson County(MS), Path of pollutants, Tidal effects.

Short-term, water-quality reconnaissances along the downstream reaches of the Pascagoula and Escatawpa Rivers in Jackson County, Miss., indicate that stream quality during the period May 1974 to July 1978 was affected by wastewater discharges as well as river discharge and the extent of tidal intrusion. Specific conductances on the Pascagoula River ranged from less than 100 to more than 40,000 micromhos per centimeter and increased downstream. Specific conductance also increased with depth at downstram sites, indicating density stratification. Dissolved-oxygen concentrations were also affected by density stratification but were generally greater than 4.0 milligrams per liter in both rivers. Analyses of 5-day biochemical oxygen demand and nutrient concentrations indicate that oxidation of both carbonaceous and nitrogenous materials significantly affected the waste assimilative capacity of the rivers. Concentrations of pesticides and most trace elements in both the water column and the bottom sediments were zero or very small. Titanium concentrations were less than 220 micrograms per liter in the water column and 6,500 micrograms per gram in bottom sediments. Small concentrations of oil and grease, PCB's, and phenols were also detected. Fecal coliform and fecal streptococcal bacteria concentrations were generally greater in the Escatawpa River and ranged from about 10 to 18,000 colonies per 100 milliliters of water. (USGS)

HYDROGEOCHEMISTRY AND SIMULATED SOLUTE TRANSPORT, PICEANCE BASIN, NORTHWESTERN COLORADO,
Geological Survey, Lakewood, CO. Water Resources Div.
S. G. Robson, and G. J. Saulnier, Jr.
Available from the OFSS, USGS Box 25425, Fed. Ctr., Denver, CO 80225. Price: $12.25 in paper copy, $3.50 in microfiche. Geological Survey Open-File Report 80-72, April, 1980. 89 p, 45 Fig, 4 Tab, 65 Ref

Descriptors: Geochemistry, *Groundwater, *Oil shales, *Mine drainage, *Colorado, Model studies, Aquifer characteristics, Water quality, *Water pollution sources, Surface-groundwater relationships, *Piceance basin(CO), Solute-transport modeling

Oil-shale mining activities in Piceance basin in northwestern Colorado could adversely affect the ground- and surface-water quality in the basin. This study of the hydrology and geochemistry of the area used groundwater solute-transport-modeling techniques to investigate the possible impact of the mines on water quality. Maps of the extent and structure of the aquifer were prepared and show that a saturated thickness of 2,000 feet occurs in the northeast part of the basin. Ground-water recharge in the upland areas in the east, south, and west parts of the basin moves down into deeper zones in the aquifer and laterally to the discharge areas along Piceance and Yellow Creeks. The saline zone and the unsaturated zone provide the majority of the dissolved solids found in the ground water. Precipitation, ion-exchange, and oxidation-reduction reactions are also occurring in the aquifer. Model simulations of groundwater pumpage in tracts C-a and C-b indicate that the altered direction of groundwater movement near the pumped mines will cause an improvement in groundwater quality near the mines and a degradation of water quality downgradient from the tracts. Model simulations of mine leaching in tract C-a and C-b indicate that equal rates of mine leaching in the tracts will produce much different effects on the water quality in the basin. Tract C-a, by virtue of its remote location from perennial streams, will primarily degrade the groundwater quality over a large area to the northeast of the tract. Tract C-b, by contrast, will primarily degrade the surface-water quality in Piceance Creek, with only localized effects on the groundwater quality. (USGS)

Descriptors: Data collections, Networks, *Water quality, *Surface waters, *Indiana, *Strip mines, Water analysis, Heavy metals, Air temperature, Precipitation(Atmospheric), Streambeds, Streamflow, Hydrologic data, Sampling, Sites, Southwestern Indiana, Coal mining, *Path of pollutants, *Mine wastes

On August 3, 1977, the Surface Mine Control and Reclamation Act, Public Law 95-87 (the Act) was enacted by the 95th Congress. Under Section 507(b)(11) of the Act, an appropriate Federal or State agency must provide applicants for coal-mining permits hydrologic and water-quality information for the general use of proposed mining. To help meet the goals of the Act, the U.S. Geological Survey is designing a data-collection network in the coal-mining region of southwestern Indiana. The purpose of the network is to provide hydrologic and water-quality data on the 'general area' for coal-mining permits. Because of the large size of the study area and the lack of hydrologic and water-quality data, a preliminary assessment is being done to determine the factors that affect water quality in the coal-mining region. This information will be used in designing a data network that will (1) provide the hydrologic and water-quality data needed by applicants for coal-mining permits and (2) determine the major factors that affect water quality. Reconnaissance data were collected at 293 sites in March, and hydrologic and water-quality data were collected at 84 synoptic sampling sites in May. (Synoptic sampling is the virtually simultaneous collection of data at specific sites.) In the reconnaissance, pH, specific conductance, dissolved-oxygen concentration, temperature, and Eh of streams were measured on site to provide general water-quality data. In the synoptic sampling, the preceding characteristics, as well as concentrations of various dissolved and suspended constituents of stream water and concentrations of heavy metals on streambed materials, were determined. HYDRAULIC CHARACTERISTICS OF AN UNDERDRAINED IRRIGATION CIRCLE, MUSKEGON COUNTY WASTE WATER DISPOSAL SYSTEM, MICHIGAN,
Geological Survey, Lansing, MI. Water Resources Div.
M. G. McDonald
Available from the OFSS, USGS Box 25425, Fed Ctr., Denver, CO 80225, Price: $2.75 in paper copy, $3.50 in microfiche. Geological Survey Open-File Report 80-773, June, 1980. 18 p, 9 Fig, 9 Ref.

Descriptors: *Hydraulic conductivity, *Groundwater movement, *Waste water disposal, *Sprinkler irrigation, *Michigan, Computer models, Groundwater recharge, Aquifer characteristics,

Aquitards, Geohydrologic units, Drainage systems, Numerical analysis, Hydrogeology, Evaluation, *Muskegon County(MI).

Muskegon County, Mich., disposes of wastewater by spray irrigating farmland on its waste-disposal site. Buried drains in the highly permeable unconfined aquifer at the site control the level of the water table. Hydraulic conductivity of the aquifer and drain leakance, the reciprocal of resistance to flow into the drains, was determined at a representative irrigation circle while calibrating a model of the ground-water flow system. Hydraulic conductivity is .00055 meter per second, in the north zone of the circle, and .00039 meter per second in the south zone. Drain leakance is low in both zones: 0.0000029 meter per second in the north and 0.0000095 meter per second in the south. Low drain leakance is responsible for waterlogging when irrigation rates are maintained at design levels. The capacity of the study circle to accept wastewater has been reduced by more than 35%. Descriptors: *Water quality, *Rivers, *Model studies, *Colorado, Projections, Analytical techniques, Computer models, Simulation analysis, Data collections, Reaeration rates, Nutrients, Water pollution control, Waste assimilative capacity, Evaluation, *Arkansas River(CO), *Pueblo County(CO).

The U.S. Geological Survey conducted a 1-year study to calibrate and demonstrate the use of a steady-state water quality model for a 42-mile reach of the Arkansas River in Pueblo County, Colo. Based on the calibration, the model is capable of accurately predicting concentrations of carbonaceous biochemical oxygen demand, total organic nitrogen, total nitrite, and total orthophosphate; predicted concentrations of total ammonia, total nitrate, and dissolved oxygen will be somewhat less accurate. Additional data are needed to determine the model's capability to predict concentrations of coliform bacteria. Potential uses of the model were demonstrated by simulating the effects of different waste water discharges on streamflow quality, using water-quality and stream-discharge data provided by the Pueblo Area Council of Governments. Selected results for carbonaceous biochemical oxygen demand and total ammonia from three simulations illustrate the capability of the model. (USGS)

PHYSICAL VARIABILITY AND PHYTOPLANKTON COMMUNITIES: I. THE DESCRIPTIVE LIMNOLOGY OF HAMILTON HARBOUR,
McMaster Univ., Hamilton (Ontario). Dept. of Biology.
G. P. Harris, B. B. Piccinin, G. D. Haffner, W. Snodgrass, and J. Polak.
Archiv fur Hydrobiologie, Vol 88, No 3, p 303-327, April, 1980. 13 Fig, 1 Tab, 30 Ref.

Descriptors: *Water pollution effects, *Hamilton Harbour, *Eutrophication, Fluctuations, Phytoplankton, *Lake Ontario, Canada, Limnology, Biomass, Algae, Phosphorus compounds, Nitrogen compounds, Dissolved oxygen, Stratification, Nutrients, Silica, Municipal wastes, Industrial wastes.

Hamilton Harbour, Lake Ontario, Canada, receives a number of municipal and industrial effluents. The physical and chemical features of this water have been studied during 1975-1977 to determine the effects of this pollution. The harbor could be classified as extremely eutrophic on the basis of its high phosphorus (10.5 g per sq meter per year) and nitrogen (320 g per sq meter per year) loadings and low dissolved oxygen, but its algal standing crop and primary productivity indicate a meso-eutrophic situation. This is a result of extreme fluctuations in water movement and thermal conditions as well as exchange with Lake Ontario. Concentrations of soluble reactive phosphorus, soluble reactive silica, and total phosphorus fluctuated and showed little correlation with the phytoplankton biomass. This is the first in a series of papers describing the effects of physical processes on the phytoplankton community in Hamilton Harbour. (Cassar-FRC)

British Phycological Journal, Vol 15, No 4, p 429-446, December, 1980. 4 Fig, 5 Tab, 44 Ref.

Descriptors: *Eutrophication, *Lakes, *Algae, *Nutrients, Speciation, Phytoplankton, Aquatic plants, Water pollution effects, Limnology, Adaptation, Otis Lake, Michigan, *Periphyton, Distribution, Hickling Broad, United Kingdom.

The periphyton community in nutrient-rich lakes reflects the external environmental conditions rather than the specialized conditions near the macrophyte surfaces. In infertile lakes the periphyton community is highly host-specific because it has adapted to nutrient uptake at low concentrations and has low growth rates adjusted to nutrient supply. Observations in a very fertile lake, Hickling Broad, showed great similarity among the periphyton community (dominated by diatoms and Scenedesmus) of the macrophyte species. Nevertheless, some specificity was shown. In Otis Lake, Michigan, an infertile lake, desmids, filamentous Conjugatophyceae and other chlorophyta were common. The four macrophytes investigated here, although sharing some species, each had several species not found in large numbers near the others. (Cassar-FRC)

EFFECT OF OXYGEN REDUCTION RATE AND CONSTANT LOW DISSOLVED OXYGEN CONCENTRATIONS ON TWO ESTUARINE FISH,
Johns Hopkins Univ., Laural, MD. Applied Physics Lab.
D. T. Burton, L. B. Richardson, and C. J. Moore.
Transactions of the American Fisheries Society, Vol 109, No 5, p 552-557, September, 1980. 2 Fig, 2 Tab, 30 Ref.

Descriptors: *Fishkill, *Dissolved oxygen, *Menhaden, *Spot, *Estuaries, Chesapeake Bay, Stratification, Water pollution effects, Laboratory studies, Oxygen reduction effects.

Lethal dissolved oxygen threshold concentrations at 28C were 1.1 and 0.7 mg per liter for Atlantic menhaden and spot. The 96 hour 5% lethal concentrations were 1.6 and 0.8 mg per liter, respectively. The rate of reduction of oxygen concentration (varying from 0.08 to 1.00 mg per liter hourly) did not affect the mean dissolved oxygen concentration at death (0.4 mg per liter). Thus the fish did not acclimatize to a low dissolved oxygen content. If the rate of oxygen reduction is constant, the time until fishkills occur can be determined from an inverse relationship between the LT50 and the rate of oxygen reduction. (Cassar-FRC)

DEGRADATION OF CHLOROPHENOLS IN SOIL, SEDIMENT, AND WATER AT LOW TEMPERATURE,
Waterloo Univ., (Ontario). Dept. of Biology.
M. D. Baker, C. I. Mayfield, and W. E. Inniss.
Water Research, Vol 14, No 12, p 1765-1771, December, 1980. 3 Fig, 3 Tab, 20 Ref.

Descriptors: *Microbial biodegradation, *Phenols, Soil microorganisms, *Chlorophenols.

A study to determine whether psychrotrophic microorganisms are capable of degrading chlorophenols in soil, water, and sediments is described. The effect these compounds have on psychrotrophic sediment microorganisms was also determined. Ortho-chlorophenol, para-chlorophenol, and 2,4-dichlorophenol were degraded by soil and sediment microorganisms at 0 deg C and 4C. Metachlorophenol and pentachlorophenol were also degraded, but to a lesser extent. Stream water microorganism were only able to degrade 2,4-dichlorophenol at 20C, and had no effects on others at 0 deg C or 20C. The addition of some chlorophenols was found to stimulate aerobic, and to some extent anaerobic, microbial growth in sediment incubated at 0 deg C. The concentration of some chlorophenols decreased in both sterile and nonsterile stream water at 0 deg C and 20C. This could not be explained by microbial contamination, photodecomposition, or volatilization. (Small-FRC)

ENVIRONMENTAL STUDY OF THE TAGUS ESTUARY,
Gore and Storrie Ltd., Toronto (Ontario).
M. Palmer, and T. R. Espirito Santo.
Nature and Resources, Vol 16, No 3, p 14-20, July/September, 1980. 1 Fig.

Descriptors: *Tagus Estuary, *Estuaries, *Project planning, *Lisbon, Portugal, Planning, Water pollution effects, Water pollution sources, United Nations, Aquatic life.

Objectives for an environmental study of the Tagus Estuary, at Lisbon, Portugal, were developed. This 320 sq km body of water, used for fishing, transport, water supply, wildlife habitat, recreation, and receiving of wastes, is polluted

with industrial and municipal wastes. The preparatory phase of the project, completed in 1976, was a review of pertinent literature and historical data and development of individual study components such as water quality, sediment, plankton, and modelling the physical characteristics. The second phase, starting in 1978 and scheduled to last 3.5 years, involves analysis and interpretation of all gathered data. Its objective is the rational management of the estuary by a thorough understanding of all processes occurring in it. The final phase concerns integration of all individual studies and recommendations for control measures and further studies. The executing agency for this project is UNESCO. (Cassar-FRC)

GROWTH KINETICS OF FRESHWATER BACTERIAL POPULATIONS AND ISOLATED STRAINS,
National Research Inst. of Aquaculture. (Japan)
N. Tanaka, M. Onizawa, and H. Kadota.
Japanese Journal of Limnology, Vol 41, No 2, p 75-83, April, 1980. 7 Fig, 2 Tab, 5 Ref.

Descriptors: *Bacteria, *Growth rates, *Lakes, Nutrients, Freshwater, Lake Biwa, *Japan, Kinetics, Microorganisms, Aquatic microorganisms.

Natural bacterial populations and isolated strains from Lake Biwa, Japan, were used to study the relationship between growth rate and organic nutrient concentration. Kinetic parameters (half-saturation constants) of three groups of natural populations were counted on media with 3 different levels of peptone nutrient (0.5, 5, and 10 grams per liter) Results were 1.15, 0.82, and 0.49 mg per liter respectively. Under the same conditions, three isolates showed results of less than 0.005 to 6.94, 0.04 to 313, and 0.156 to 4,000 mg per liter respectively Different sizes of suspended particulates were studied. Most bacteria were found in the particles above 1.2 microns in size. This 1.2 micron fraction appeared to grow optimally in media with 4 g peptone per liter; 3-1.2 micron fraction in 2 g per liter; and 5-3 micron fraction, 0.25 g per liter (Cassar-FRC)

PHYTOPLANKTON RESPONSE TO SEWAGE REDUCTION IN VATTERN, A LARGE OLIGOTROPHIC LAKE IN CENTRAL SWEDEN,
Uppsala Univ. (Sweden). Inst. of Limnology.
P. Olsen, and E. Willen.
Archiv fur Hydrobiologie, Vol 89, No 1/2, p 171-188, June, 1980. 7 Fig, 41 Ref.

Descriptors: *Phytoplankton, *Eutrophication, *Oligotrophy, Lake Vattern, *Sweden, Sewage, Aquatic algae, Algae, Diatoms, Cyanophyta, Lakes, Limnology, Water pollution effects, Phosphorus compounds, Biological oxygen demand, Chlorophyta, Waste water treatment.

After the water quality of Lake Vattern, a 1,912 sq km oligotrophic clear lake in Sweden, deteriorated seriously in the mid 1960s, a purification program was initiated and completed in 1974. This involved biological and chemical treatment of sewage water in the entire drainage area and removal of a zinc ore dressing plant near the lake. Present indications are that the lake is returning to an oligotrophic state. When conditions reached a nadir in 1967, transparency was 6 meters (15-17 meters in 1980), phosphorus loading was 200 tons (50 tons in 1940's), BOD 13,000 tons, mostly from the pulp and paper industry, and biomass was 0.3 cu mm per liter. The most abundant species were those common in eutrophied lakes--diatoms, cryptomonads, green algae, and blue-green algae. More recent parameters are: Secchi disc reading of 15 meters in 1975, annual phosphorus loading 80 tons, annual BOD supply 3,000 tons, and standing crop of phytoplankton 0.07 cu mm per liter in 1971. In addition to the lowered plankton level maintained since 1971 (0.96 to 0.13 cu mm per liter) the diatoms, cryptomonads, green algae, and blue-green algae have decreased, and the chrysophytes and other oligotrophic indicators have become more prominent. (Cassar-FRC)

EUTROPHICATION PARAMETERS AND TROPHIC STATE INDICES IN 30 SWEDISH WASTE-RECEIVING LAKES,
National Swedish Environment Protection Board, Uppsala. Algal Assay Lab
C. Forsberg, and S-O. Ryding
Archiv fur Hydrobiologie, Vol 89, No 1/2, p 189-207, June, 1980. 7 Fig, 4 Tab, 34 Ref

Descriptors: *Eutrophication, *Lakes, *Classification, *Sweden, Limnology, Chlorophyll, Trophic level, Nitrogen compounds, Phosphorus compounds, Nutrients, Turbidity, Light penetration, Algae, Waste water(Pollution), Water quality

A trophic classification scheme for lakes was developed after 4,500 water samples from 30 Swedish lakes had been analyzed and correlated over a 6-year period. Total nitrogen, total phosphorus, and chlorophyll are expressed in mg per cu meter and transparency in meters in the following listing, based on summer average values: oligotrophic--N less than 400, P less than 15, chlorophyll less than 3, and transparency less than 4.0; mesotrophic--N 400-600, P 15-25, chlorophyll 3-7, and transparency 2.5-4.0; eutrophic--N 600-1500, P 25-100, chlorophyll 7-40, and transparency 1.0-2.5; hypertrophic--N greater than 1500, P greater than 100, chlorophyll greater than 40, and transparency less than 1.0. Many proposed trophic classifications depend on only one parameter. These give misleading results in some cases, for example, when algal growth is inhibited by an unusual factor. A two-dimensional approach gives better information. In some situations, all four variables should be considered. (Cassar-FRC)

ESTIMATED SAFE ZINC AND COPPER LEVELS FOR CHINOOK SALMON, ONCORHYNCHUS TSHAWYTSCHA, IN THE UPPER SACRAMENTO RIVER, CALIFORNIA,
California State Dept. of Fish and Game, Rancho Cordova. Water Pollution Control Lab.
B. J. Finlayson, and K. M. Verrue.
California Fish and Game, Vol 66, No 2, p 68-82, April, 1980. 1 Fig, 3 Tab, 25 Ref. 4 Append.

Descriptors: *Copper, *Zinc, *Salmon, *Toxicity, Growth stages, Chinook salmon, Fishkill, Upper *Sacramento River, California, Acid mine water, Mine wastes, Water pollution effects.

Chronic (83 days) and acute (96 hours) toxicity tests conducted on chinook salmon--eggs, alevins, and swim-up fry--indicated that 'safe' levels of copper and zinc were below 11 and 83 micrograms per liter, respectively. The investigation, prompted by fish kills from acid mine wastes with copper to zinc ratios of 1:2 to 1:12 in the upper Sacramento River, showed that 83 day LC50 values for eggs-to-fry salmon were as follows (all units in micrograms per liter): 1:3 ratio, Cu 44 and Zn 160; 1:6 ratio, Cu 27 and Zn 206; and 1:11 ratio, Cu 17 and Zn 253; demonstrating that the toxicities of Cu and Zn were additive. Fry previously unexposed to the trace metals showed lower tolerance to the 1:3 ratio (Cu 37 and Zn 132) and higher tolerance to the 1:6 and 1:11 ratios: Cu 29 and Zn 213, Cu 20 and Zn 279, respectively. Eggs showed a similarity to the other stages, alevins and fry, in tolerance to copper-zinc solutions. (Cassar-FRC)

AVOIDANCE RESPONSE OF JUVENILE CHROMIS PUNCTIPINNIS TO CHLORINATED SEAWATER,
Occidental Coll. Los Angeles, CA. Dept. of Biology
J. E. Hose, and R. J. Stoffel.
Bulletin of Environmental Contamination and Toxicology, Vol 25, No 6, p 929-935, December, 1980. 1 Fig, 5 Tab, 12 Ref.

Descriptors: *Powerplants, *Chlorination, *Fish behavior, *Effluents, Sea water, Aquatic habitats, Dishcarge(Water), Water temperature, Thermal pollution

In a study of the effects of chlorinated seawater power plant effluent, juvenile blacksmith fish (Chromis punctipinnis) totally avoided chlorinated seawater with total residual oxidant value (TRO) of 0.15-0.16 ppm and showed statistically significant avoidance at 0.08-0.10 ppm. Tests were conducted in a counterflow behavior chamber in which half the water was chlorinated. Size of fish was directly correlated with TRO avoidance level. When the chlorinated seawater was elevated 3C above the non-chlorinated water, fish totally avoided the water at 0.086 ppm TRO, about half that at the lower temperature. Winter (15C) and summer (20C) and discharge temperatures (24C) were compared. Total avoidance levels were 0.162, 0.152, and 0.132 ppm respectively. Fish in tanks with abundant brine shrimp available in the chlorinated water had an avoidance level of 0.203 ppm, compared with 0.162 ppm for fish with no readily available food supply. Starved fish were also more tolerant of chlorinated water, having a total avoidance level of 0.327 ppm compared with 0.175 ppm for satiated fish. (Cassar-FRC)

Descriptors: *Toxicity, *Fish, *Pulp and paper industry, *Pulp wastes, Laboratory tests, Fisheries, Effluents, Assay, Water analysis, Waste water treatment, *Industrial wastes

The efficiency of a waste treatment system employed at a large pulp and paper mill was evaluated by exposing several species of fish to composite effluent for varying lengths of time. The waste was treated using aerated stabilization basins, which have a reported 90% efficiency in reducing toxicity, biochemical oxygen demand, and resin acids. Thirty fish of each species were placed in aquaria with various effluent concentrations for 20 to 30 day periods. Although some mortality was observed during the study, no toxic effects were directly attributable to effluent exposure. The aerated stabilization basin produces effluent comparable in quality to that produced by other methods. (Titus-FRC)

BIOLOGY OF THE NORTH ARM,
Utah State Univ., Logan. Dept. of Biology.
F. J. Post.
In: Great Salt Lake: A Scientific Historical and Economic Overview. Utah Geological and Mineral Survey, Utah Department of Natural Resources, Salt Lake City, Utah. Bulletin 116, p 313-321, 1980. OWRT-A-024-UTAH(8), 14-34-0001-6046.

Descriptors: Bacteria, Bacteriophage, *Saline lakes, Oxygen requirement, Algae, Brine shrimp, *Environmental effects, *Aquatic life, Biological communities, *Great Salt Lake, *Utah.

The extreme stress of high salt, about 360 g/l, and low oxygen solubility in the north arm of the Great Salt Lake has led to a biological community of low diversity and few species. Those organisms with adaptive mechanisms evolved to withstand the rigors of this harsh environment occur in numbers large enough to color the water a wine red. Nutrients seem abundantly available except for an inorganic source of nitrogen. The bacteria supply what little ammonia is available for the algae and the algae in turn excrete organic matter used by the bacteria. Organic nitrogen is plentiful but possibly in a form unavailable to the bacteria since it does not seem to support their growth. Each of the biological members, bacteria, bacteriophage, algae, brine fly and brine shrimp is discussed, as well as the community as a whole.

Descriptors: *Lake Kasumigaura(Japan), *Lake sediments, *Eutrophication, *Phosphorus, Nutrients, Plant growth, Algae, Inorganic compounds, Lakes, Sediments, Aerobic conditions, Anaerobic conditions, *Japan.

The relationship between the content of various forms of phosphorus in lake sediments and the amount of phosphorus released under aerobic and anaerobic conditions was studied because of the role of phosphorus in the eutrophication process. The total phosphorus content in the sediment of Lake Kasumigaura, Japan, was highest (1.7 mg/g) in the 0-5 cm surface layer and decreased with depth to a constant (0.7 mg/g) at 15 cm. The decrease was consistent with a decrease in iron-bound phosphorus content (Fe-P). The amount of phosphorus released from the sediments was proportional to the decrease of Fe-P under both aerobic and anaerobic conditions. Under anaerobic conditions, 90% of the Fe-P initially contained in the sediments was released in 55 days. Using a dialysis apparatus, maximum growth yield of algae was shown to be linearly dependent on the amount of phosphorus released under aerobic conditions. (Brambley-SRC)

In: Management of Bottom Sediments Containing Toxic Substances, Proceedings of the Fifth United States-Japan Experts Meeting, Nov., 1979, New Orleans, LA, Environmental Protection Agency Report EPA-600/9-80-044, Sep., 1980, p 209-228. 18 Fig.

Descriptors: *Lake sediments, *Lake Nakanoumi(Japan), *Phosphorus, Eutrophication, *Mathematical models, Models, Lakes, Sediments, Water pollution effects, *Japan, Phosphorus release rates.

A study was conducted on the phosphorus release mechanism of lake sediment in a eutrophic area of Lake Nakanoumi, Japan. Sediment samples were used to examine the relationship between phosphorus content and sediment depth and to measure the amounts of phosphorus released. Release rates depended primarily on the phosphorus content of the sediment. The relationship between release rate and sediment depth is apparently parabolic. The partition coefficient for phosphorus is about 0.00001 1/day. The release rate curve becomes flat at sediment depths of about 20 cm. A mathematical model of phosphorus release rates was conceived and evaluated. The similarity and order of the various indices and curves implies that more attention should be paid to hydrostatic factors among the parameters affecting phosphorus release mechanisms. FISH KILLS CAUSED BY POLLUTION IN 1977; EIGHTEENTH REPORT.
Environmental Protection Agency, Washington, DC. Office of Water Planning and Standards.
Report EPA-440/4-80-004, 1980. 73 p, 44 Fig, 8 Tab, 5 Append.

Descriptors: *Fishkill, *Water pollution effects, *Water pollution sources, Pesticides, Seasonal, Industrial wastes, Agricultural chemicals, Transportation, Endrin, Municipal wastes, Toxaphene, Cyanide.

This eighteenth annual report analyzes 503 fish kill reports made by 41 states. The remaining nine states reported no fish kills. A total of 16.5 million fish were reported killed in 449 of the 503 incidents. Most fish kills were small, killing fewer than 10,000 fish apiece, but two incidents accounted for 76% of the fish killed. Sources of pollution were identified for 383 of the reports. Municipal operations accounted for 21% of the incidents, agricultural operations and industrial operations 19% each, and transportation operations 9%. The summer months (May to September) accounted for 15 million fish deaths and 325 of the incidents occurred in these months. For the 50% of the reports giving information, the average duration was 2.5 days. The priority pollutants cyanide, endrin, and toxaphene killed more than 300,000 fish in twelve reported incidents. 5D. Waste Treatment Processes

DESIGN AND ECONOMICS OF POWDERED ACTIVATED CARBON IN THE ACTIVATED SLUDGE PROCESS,
Engineering-Science Inc., Austin.
D. L. Ford, and W. W. Eckenfelder.
Progress in Water Technology, Vol 12, No 5, p 459-482, 1980. 14 Fig, 12 Tab, 25 Ref.

Descriptors: *Activated carbon, *Granules, *Activated sludge, Costs, Design criteria, Nitrification, Biochemical oxygen demand, Chemical wastes, Energy, Capital costs, Operating costs, Treatment facilities.

Recent progress in powdered activated carbon technology is reviewed, and energy demand capital and annualized cost information is presented. The applicability of activated carbon in removing organic and selected inorganic constituents can be tested using batch reactors in an isotherm approach. Following screening tests, bench scale reactors can be used to develop design criteria. Municipal waste water treatment plants using activated carbon have reported enhanced BOD removal, better control of effluent suspended solids, and improved nitrification. The chemical industry has

used the system to treat organic chemical wastes. A design of a powdered activated carbon system for a refinery is presented, and an overall costs model is derived. Energy is required for furnace usage as well as conveyance, unloading, slurry, and feed systems. The potential economic and process advantages of powdered activated carbon make it an attractive alternative treatment for wastes containing residual organic pollutants, many of which are suspected carcinogens, mutagens, or teratogens. EXPERIENCE IN OPERATING THE DEEP SHAFT ACTIVATED SLUDGE PROCESS,
Anglian Water Authority (England). Essex Sewage Div.
O. C. Collins, and M. D. Elder.
Progress in Water Technology, Vol 12, No 5, p 671-684, 1980. 3 Fig, 1 Tab, 6 Ref.

Descriptors: *Activated sludge, *Treatment facilities, Domestic wastes, Municipal wastes, Organic matter, Settling basin, Performance, Deep Shaft, United Kingdom, Sewage treatment, Industrial wastes, *Thames River, *Waste water treatment.

The design, construction, and operating experience with a deep shaft activated sludge plant for the treatment of a mixture of domestic and industrial wastes is described. At the Marsh Farm plant in the United Kingdom, the 130 m deep, 1.86 m diameter shaft is divided into two concentric zones by an inner glass fiber tube. Crude sewage and returned activated sludge are lifted by screw pumps into the head tank for mixing before passage into the shaft for a retention time on the order of 1.5 hrs. Compressors introduce the air into both the riser and downcomer zones. Degassed mixed liquor is settled in a conventional clarifier. The dissolved oxygen level in the system is monitored continuously. Sewage analysis and sludge data are presented. The deep shaft system removed the high organic load and produced an effluent acceptable for discharge to the estuarial River Thames. There are some unsolved problems with degassing and settlement. (Small-FRC)

THE ACTIVATED SLUDGE PROCESS PART 2. APPLICATION OF THE GENERAL KINETIC MODEL TO THE CONTACT STABILIZATION PROCESS,
Scott and de Waal, Inc., Johannesburg (South Africa).
W. V. Alexander, G. A. Ekama, and G. v. R. Marais.
Water Research, Vol 14, No 12, p 1737-1747, December, 1980. 5 Fig, 2 Tab, 6 Ref.

Descriptors: *Mathematical models, *Activated sludge, Stabilization, *Municipal wastes, Kinetics, *Nitrification, Control, Cycles, Design, *Waste water treatment.

A general activated sludge model which includes nitrification for processes treating principally municipal waste water was applied to a contact stabilization process treating municipal waste waters. The model was changed to fit the new application. One of the values of the kinetic constants in the expressions of the substrate utilization rates was changed. Also, the enmeshment mechanism was altered by accepting that a fraction of the particulate COD which is not adsorbed onto the active organisms does not become enmeshed in the sludge flocs and escapes with the effluent. With these changes, the model was found to simulate the behavior of contact and stabilization reactors under constant and cyclic loading conditions. When the cyclic behavior of the process was investigated, it was found that peak flow periods reduce the carbonaceous material removal and nitrification efficiencies of the process in two ways. First, the actual hydraulic retention was reduced, and second, the sludge concentration in the contact reactor was reduced. This procedure can be useful for design engineers. (Small-FRC)

INTENSIFIED BIOLOGICAL WASTE WATER TREATMENT CITY OF FRANKFURT AM MAIN,
Technische Hochschule, Darmstadt (Germany, F. R.). Inst. fuer Wasserversorgung, Abwasserbeseitigung und Raumplanung
G. Rincke, and L. G. Gniosdorsch.
Progress in Water Technology, Vol 12, No 5, p 483-496, 1980. 8 Fig, 4 Tab, 7 Ref.

Descriptors: *Activated sludge, *Nitrification, *Treatment facilities, *Biological waste water treatment, Denitrification, Municipal wastes, Sludge treatment, Phosphorus, Bacteria, Lime, Water quality, *Frankfurt, Federal Republic of Germany, *Waste water treatment.

Intensified waste water treatment at the Frankfurt-Niederrad plant was developed, including studies of the sludge problem at the plant and consideration of phosphorus removal by the PHOSTRIP process. The treatment facilities consist of, in the second stage, aeration basin 1, settling basin 1, denitrification basin, aeration basin 2, and settling basin 2. The sludge is recycled, and part of the activated sludge waste water mixture is recycled directly from the effluent of the second activated basin. Reliable denitrification was found possible only in a separate stage in the presence of methanol. There was basically reliable nitrification even in cold weather. A sludge study is in progress which will examine the possibility of incineration without supplementary fuels by modifying various process techniques. Also, tests are being conducted on the feasibility of using the PHOSTRIP method of phosphate removal. Take up of phosphorus by bacteria is utilized via precipitation with lime. With these methods, the water quality of the heavily polluted Lower Main will be improved. (Small-FRC)

CONTROL OF NITRIFICATION IN THE OXYGEN ACTIVATED SLUDGE PROCESS,
Houston Univ., TX. Dept. of Civil and Environmental Engineering.
J. F. Andrews, P. E. Sorensen, and M. T. Garrett
Progress in Water Technology, Vol 12, No 5, p 497-519, 1980. 11 Fig, 15 Ref

Descriptors: *Control, *Activated sludge, *Nitrification, Oxygen, Ammonia, Computers, Treatment facilities, Municipal wastes, Equations, Performance, *Houston, Texas, *Waste water treatment.

A control strategy selected for a two step oxygen activated sludge process is expected to maintain the effluent ammonia concentration in the 2 to 4 mg/liter range. It is a feedforward strategy in which the influent ammonia concentration is measured by an online ammonia analyzer. A portion of the influent flow to the nitrification reactor is diverted to a fourth stage of this reactor so that the effluent ammonia concentration is in the desired range. A computer is used to solve material balance and control algorithm equations. The strategy was tested for approximately two weeks using the nitrification step of a two-step UNOX pilot plant installed at the Northside waste water treatment plant in Houston. Process control was performed by a Hewlett-Packard 9825 computer with real-time clock, floppy disc, and multiprogrammer for interfacing. An Ionics ammonia analyzer was used, and ammonia concentrations were measured and entered into the computer at two or four hour intervals. The strategy was viewed as successful, and expected annual savings of $250,000 per year were estimated for chlorine costs. (Small-FRC)

PERIODIC PARAMETER VARIATION IN A FULL SCALE TREATMENT PLANT WITH ALTERNATING OPERATION,
Technical Univ. of Denmark, Lyngby. Dept. of Sanitary Engineering.
J. L. C. Jansen, and J. C. Behrens.
Progress in Water Technology, Vol 12, No 5, p 521-532, 1980. 8 Fig, 2 Tab, 4 Ref.

Descriptors: *Biological treatment, *Nitrogen removal, *Treatment facilities, Design, Oxygen, Biochemical oxygen demand, Municipal wastes, Ammonia, Nitrogen, Alternating operation, Denmark, *Waste water treatment.

Biological nitrogen removal in a one sludge system using alternating operation is described, and results are presented for operation of a plant designed for a population of 33,000 people. Ninety percent nitrogen removal and 98% BOD removal was maintained using an alternating mode of operation. Key parameters for the design of nitrogen removal plants were determined using a 24-hour scale full-scale experiment and a mathematical model. The theoretical maximum ammonia removal rate was 1.0 mg NH4(+)-N/g VSS/h. In actuality, the rate is reduced by a Monod-type oxygen limitation with a half saturation constant equaling 2 mg of oxygen/liter. The maximum rate of nitrate removal was 7.8 mg NO3(-)-N/g VSS/h, and this rate had a logistic dependence on the oxygen concentration, resulting in a substantial nitrate removal up to 3 mg oxygen/liter in the reactor. ODORS AND THEIR CONTROL IN SEWERS AND TREATMENT FACILITIES,
Los Angeles City Bureau of Sanitation, CA.
W. F. Garber.
Progress in Water Technology, Vol 12, No 5, p 657-664, 1980. 1 Fig, 4 Ref.

Descriptors: *Odor control, *Treatment facilities, *Sewers, Turbulence, Hydrogen sulfide, Incineration, Activated carbon.

The control of odors at treatment plants is reviewed. Odor at most treatment plants is due to the presence of hydrogen sulfide, solvents, acid fractions, or reductant fractions in the waste water. Long retention times in sewers can add to the problem. Low turbulence, high flows, and high oxygen contents in sewers can reduce odor production. In treatment plants, turbulence can be minimized except in cases of aerobic treatment. Odor treatment systems include ventilation systems which collect air for treatment, chemical treatment of the waste water, and the use of perfumes or masking agents. Treatment facilities include packed towers, biological reactors, incineration units, dispersion units such as high stacks, and activated carbon contact towers. In the City of Los Angeles, the general experience has been that odor treatment is difficult and expensive. Proper plant design and operation are preferred methods of avoiding the odor problem. THAMES WATER AUTHORITY RIVERSIDE WASTE WATER TREATMENT WORKS - TRADE EFFLUENT TREATMENT PLANT OPERATING PROBLEMS AND THEIR RESOLUTION,
Thames Water Authority, London (England). Metropolitan Public Health Div
R. A. R. Drake, and P. A. Banks.
Progress in Water Technology, Vol 12, No 5, p 643-656, 1980. 2 Fig, 4 Tab, 2 Ref

Descriptors: *Industrial wastes, *Treatment facilities, Aeration, Settling basins, Activated sludge, Sprays, Hazards, Safety factors, United Kingdom, *Waste water treatment, *Thames Water Authority.

Pilot plant experimental work, the design of permanent units, and the mode of operation of industrial effluent treatment plants are described. The Riverside waste water treatment plant serves a population of 400,000. Twenty percent of its capacity is devoted to providing separate treatment for industrial wastes produced by a motor manufacturer and a pharmaceutical and agricultural products manufacturer. Pilot plant studies revealed that an aeration period of at least 12 hours was necessary to treat the industrial wastes. The final plant design included primary treatment consisting of grit removal and screening. There are three circular primary sedimentation tanks with a total capacity of 2850 cu m. Biological treatment is by the activated sludge process using Ames Crosta

Simplex surface aerators. Two final sedimentation tanks are provided. The plant was modified to reduce the speed of aeration and thus to decrease the production of a spray which was found irritating by plant operators. The industrial effluent contained manganese, toluene, and nitrobenzene. Nitrobenzene is known to cause contact dermatitis. The plant has operated successfully. (Small-FRC)

DEVELOPMENT TRENDS IN CONSTRUCTION AND CHEMICAL ENGINEERING OF BIOLOGICAL WASTE WATER TREATMENT PLANTS, TAKING HOECHSTAG AS AN EXAMPLE,
Hoechst A.G., Frankfurt-am-Main (Germany, F.R.).
A. Bauer.
Progress in Water Technology, Vol 12, No 5, p 665-670, 1980. 12 Fig, 4 Ref.

Descriptors: *Aeration, *Settling basins, *Biological waste water treatment, Treatment facilities, Performance, Odor, Design, Oxygen, Federal Republic of Germany, *Waste water treatment.

The design and operation of the Bio-Hochreaktor, a biological waste water treatment method, are described. The Bio-Hochreaktor includes a primary clarifier on top of an aeration basin. It can be used as a bubble column reactor, loop reactor, or a cascade operation. The system has been in parallel operation for 1-1/2 years, and is distinguished by a combination of high loading capacity and stable operations. The waste air problem is frequently solved with elaborate deodorization. This design follows the trend away from shallow basin and medium basin design to high level design. Even at loading rates of more than 3 kg per cu m per day, the operating performance of the Bio-Hochreaktor remains stable and produces effluent with desirable parameters. The primary advantages of the design are its smaller space requirement, improved oxygen utilization, and the fact that it can easily be covered if further odor treatment is required. (Small-FRC)

ODOURS EMITTED BY BASF AG'S ACTIVATED SLUDGE PLANT TREATING CHEMICAL WORKS EFFLUENT IN LUDWIGSHAFEN/RHINE,
BASF A.G., Ludwigshafen-am-Rhein (Germany, F.R.).
H. Engelhardt, W. G. Haltrich, and M. Wollnik.
Progress in Water Technology, Vol 12, No 5, p 621-631, 1980. 12 Fig, 2 Ref.

Descriptors: *Activated sludge, *Chemical wastes, *Odor control, Settling basins, Control, Incineration, Aeration lagoons, Equipment, Covers, *Federal Republic of Germany, Ludwigshafen-Rhine.

After startup of an activated sludge treatment plant in Ludwigshafen/Rhine for the treatment of chemical industry wastes, many complaints of odors were made by residents from a nearby town. As many as 68 complaints were received in one 20 day period. The plant consisted of a grid chamber and water splitting facility, a primary clarifier, a water splitting facility, an aeration basin, a secondary clarifier, a sludge thickener, and a high water pumping station. The pathway of the odor and the odor threshold values were determined for the plant. Thirty of the 280 production plants at the Ludwigshafen works were found to be significant sources of odor. Odor was reduced by flooding the sedimentation basins to avoid de-gassing of low-boiling substances at the overflow. Distributor, junction facilities and manholes were made gas-proof by covering them. The waste air from the sludge conditioning facility is now incinerated. Aeration basins were covered, which reduced their emissions by about 7%. The covers cost about 10 million DM. It is expected that when all odor reduction methods have been implementd, the inhabitants of nearby towns will not be troubled by sewage plant odor. (Small-FRC)
W81-02169

ON THE REDUCTION OF ODOUR EMISSIONS BY COVERING SURFACE AERATION TANKS,
Emschergenossenschaft, Essen (Germany, F.R.).
S. Schlegel.
Progress in Water Technology, Vol 12, No 5, p 633-642, 1980. 6 Fig.

Descriptors: *Odor control, *Aeration, Treatment facilities, Air pollution, Oxygen, Environmental engineering, *Germany, Covered tanks.

Odor emissions from aeration tanks can be reduced by covering the tanks, although additional treatment of the contaminated air may be required. Tests were performed to obtain dimensioning data for the covering of surface aeration tanks and to determine how high the reduction in odor emissions can be. Two pilot plants operated in parallel were covered and charged with different air throughput quantities. An equation was derived to estimate odor reduction. A considerable reduction was possible, depending upon the oxygen content in the tank gas space. One covered tank supplied with pure oxygen had very low amounts of waste air. Using pure oxygen, the gas exchange rates and odor emissions were decreased by more than 99%. Pure oxygen is needed in the first part of the aeration tank, where oxygen demand and emissions are extremely high. (Small-FRC)
W81-02173

ODOUR CONTROL WITH HYDROGEN PEROXIDE,
Interox Chemicals Ltd., Widnes (England).
A. F. E. Sims.
Progress in Water Technology, Vol 12, No 5, p 609-620, 1980. 2 Fig, 1 Tab.

Descriptors: *Odor control, *Sulfides, Oxidation, Sewerage, *Sludge treatment, Waste water treatment, Chemistry, *Hydrogen peroxide, United Kingdom.

The advantages of hydrogen peroxide control of odor are discussed, and the principles and practices involved in evaluating and implementing hydrogen peroxide odor control systems are described. Advantages of hydrogen peroxide include the fact that it is an inexpensive, stable, non-corrosive liquid. The absence of solubility limitations enables the efficient tratment of high pollutant concentrations at atmospheric pressure. It provides for rapid oxidation of a variety of sulphur containing products and for highly selective oxidation of pollutants by choice of conditions. The chemistry of hydrogen peroxide is outlined. Steps involved in estimating hydrogen peroxide usage for rising main treatment include establishment of such parameters as main dimensions, average sewage residence, daily flow rate, and pump rates. The sulfide level to be treated must be established. Hydrogen peroxide can also be used for the treatment of sulfides in sludge, odor control in industrial waste water, and gas scrubbing to prevent air pollution. Hydrogen peroxide makes possible a versatile and flexible treatment system. (Small-FRC)
W81-02174

THE DESIGN OF TWO PLANTS FOR BIOLOGICAL REMOVAL OF NUTRIENTS,
Meiring (P. G. J.) and Partners, Inc., Johannesburg (South Africa).
J. L. Barnard, and P. J. Pybus.
Progress in Water Technology, Vol 12, No 5, p 593-598, 1980. 4 Fig, 1 Tab, 1 Ref.

Descriptors: *Nutrients, *Biological treatment, *Nutrient removal, *Activated sludge, Phosphorus, Nitrogen, Nitrates, Anaerobic digestion, Aeration, Fermentation, Treatment facilities, South Africa.

Two activated sludge units were designed as extensions to biological filter plants to provide additional treatment capacity for a total contributing population of 58,000 persons. The basic process at both plants consisted of fermentation basins, first anoxic basins, aeration basins, second anoxic basins, re-aeration basins, and clarifiers. Adjustable flow valves were used at both plants to admit the flow to the activated sludge plant at a near constant rate. At one plant, the activated sludge plant was commissioned on February 1, 1979, and within two weeks was producing an effluent that met standards. A sample exhibited a COD of 24 mg/liter, phosphate content of 3.0 mg/liter, nitrogen content of 1 mg/liter, and nitrate of 1.9 mg/liter. Improved results are expected after longer operation. One plant experienced problems because of a fixed outlet weir on the surface aerators. An adjustable weir at the second plant provided more control. Plant effluent meets standards with only biological treatment. (Small-FRC)

HYDRAULIC LOSSES IN BIOLOGICAL REACTORS WITH CIRCULATING FLOWS,
Tahal Consulting Engineers, Ltd., Tel Aviv (Israel).
M. Goldstein.
Progress in Water Technology, Vol 12, No 5, p 565-592, 1980. 9 Fig, 6 Tab, 8 Ref.

Descriptors: *Head loss, *Rotational flow, *Aeration, Rotors, Equipment, Design, Equations, Baffles, *Biological treatment, *Israel.

Calculation of hydraulic losses along one complete circuit of a rotating biological reactor was necessary to design a plant with the optimum distribution of operating rotors to meet aeration requirements. Data in the literature were used. Evaluation of head loss coefficients was based on measured flows and gross power inputs for Wulkatal Regional Plant, underflow measurements for slightly immersed gates, and classic hydraulic formulae. The coefficients were checked by applying them to the calculation of flows and gross power inputs for three plants. Results indicated that the coefficients could be used for design purposes within the usual ranges of power densities and flow velocities. Hydraulic losses are caused primarily by the hydraulic resistance of baffles and guiding walls, and a special formula was developed for this. The calculated head lift per rotor was in the range of 0.5 cm to 1.5 cm, depending upon submergence. The hydraulic efficiency of the rotor was very small. A sample calculation is presented for a reactor with a volume of 1200 cu m equipped with four rotors of 4.5 m length each. (Small-FRC)

THE NEW INDUSTRIAL WASTE WATER TREATMENT PLANT AT THE CHEMICAL WORKS OF DSM (NETHERLANDS): DESIGN AND PRACTICAL EXPERIENCE,
DSM's Central Lab., Geleen (Netherlands). Environmental Research Dept.
V. E. A. Baenens.
Progress in Water Technology, Vol 12, No 5, p 599-608, 1980. 4 Fig, 2 Tab, 2 Ref.

Descriptors: *Chemical wastes, *Nitrogen, *Biological treatment, Denitrification, Nitrification, Sludge treatment, Chemical industry, Treatment facilities, Design, Performance, *Netherlands, *Waste water treatment.

A new biological treatment plant designed to remove nitrogen from waste water from an extensive chemical industry plant complex is described. The process scheme includes denitrification, nitrification, biological oxidation, second denitrification, and sludge processing. It was necessary to add BOD to the waste water to effect complete nitrate removal by denitrification. Prior to the designing and construction of the facility, laboratory experiments were carried out, and the sludge load, minimum water temperature, and maximum BOD sludge load were calculated. The initial practical experience was gained using a pilot plant and observing a domestic sewage plant. The new plant was built, and it incorporates three identical streams that are arranged in parallel. Thus, in case of a calamity, it is possible to buffer the water in separate buffer tanks, or the entire waste stream can pass through only one of the streams. This prevents the release of toxins into the river and protects downstream drinking water sources. (Small-FRC)

CHLORINE DYNAMICS DURING INACTIVATION OF COLIFORMS, ACID-FAST BACTERIA AND YEASTS,
Rensselaer Polytechnic Inst., Troy, NY.
C. N. Haas, and R. S. Engelbrecht.
Water Research, Vol 14, No 12, p 1749-1757, December, 1980. 7 Fig, 1 Tab, 26 Ref.

Descriptors: *Chlorine, *Permeability, *Coliforms, Yeasts, Bacteria, Hydrogen ion concentration, Water purification, Waste water treatment, *Water treatment.

A study which extended the permeability theory of chlorine action to vegetative microorganisms is described. Chang (1944) and others developed the theory with other microorganisms. To determine the mode of action of free chlorine in inactivating coliforms, acid-fast bacteria, and yeasts, the uptake of radioactive chlorine was determined. Cell-associated chlorine can be modelled by the Freundlich relationship, with either free available chlorine or hypochlorous acid as an independent variable. At a pH of 7.0, Candida parapsilosis and Mycobacterium fortuitum exhibited greater uptake of chlorine than at a pH of 9.14. The effect of pH on E. coli was just the opposite, probably due to losses in cellular material. The results with E. coli confirmed Frieberg's results (1956, 1957) which seem in conflict with the permeability theory. However, the increased efficiency of chlorine at low pH's may prompt extensive loss of cell material including associated chlorine. (Small-FRC)

COMPONENT MIX MEETS TOUGH STANDARDS,
N. A. Van Dyke.
Water and Wastes Engineering, Vol 17, No 11, p 36-39, November, 1980. 1 Fig, 5 Tab.

Descriptors: *Treatment facility, *Food processing industry, *Activated sludge, Flotation, Oxidation, Biological treatment, Tertiary treatment, Oils, Costs, Meat packing plant, Rendering plant, *Waste treatment.

A combination of dissolved air flotation, modified activated sludge, and biooxidation tower components was used to meet discharge permit requirements at a meat packing and rendering operation. The rendering wastes had a BOD of up to 10,000 mg/liter, extremely high amounts of oil and fats, and a temperature range up to 185 deg F. The plant was designed to treat 10,770 lbs BOD/day. Dissolved air flotation units were used for by-product recovery and for the removal of oil and grease. The bio-oxidation tower was used to pretreat the high strength, high temperature rendering wastes and helped provide teritary treatment at secondary treatment costs. Construction costs were reduced by building the aeration basin with lightly reinforced sloped slab-on-grade construction. Additional BOD and suspended solids removal was obtained through a manmade marsh system which provided a buffering zone before stream discharge. The project was constructed for $950,000. The bio-oxidation tower saved approximately 200 horsepower compared to blowers. This resulted in an annual energy savings of $31,000. (Small-FRC)

WINNING DESIGN SATISFIES DIVERSE NEEDS,
J. H. Jenks, and B. M. Wyckoff.
Water and Wastes Engineering, Vol 17, No 11, p 16-18, 20, 21, November, 1980. 3 Fig, 4 Tab.

Descriptors: *Treatment facilities, *Municipal wastes, *Architecture, Design, Buildings, Odor control, Environmental engineering, *Waste water treatment, *California, San Mateo.

A two mgd, 45-year-old primary waste water treatment plant was economically transformed into a 13.6 mgd plant which meets teritary treatment standards. The San Mateo, California, plant had been enlarged three times for expanded primary treatment and was quite extensive. The most recent expansion included covering the existing and new primary clarifiers and sludge thickeners with domes, installing high capacity ventilation systems with air scrubbers, and housing sludge dewatering facilities including new vacuum filters in an area furthest away from housing and a school. All air from the buildings was introduced into the combustion air system of the solids incinerator, low noise level centrifugal blowers were used to supply air to aeration tanks, and all noise producing equipment was housed in sound-damping buildings. The plant site was surrounded with attractive fencing and landscaped. Odor control programs included prechlorination as a backup. While the old plant's public image had ben poor, the new plant was favorably accepted by the community and handled wet-weather flows. (Small-FRC)

FLEXIBLE SYSTEM SAVES ENERGY,
J. A. Gennrich, and M. M. Gipps.
Water and Wastes Engineering, Vol 17, No 11, p 40-43, November, 1980. 1 Fig, 5 Tab.

Descriptors: *Treatment facilites, *Canneries, *Flexibility, Municipal wastes, Industrial wastes, Trickling filters, Aeration, Non-uniform flow, Biochemical oxygen demand, *California, Settling basins, *Waste water treatment, Atwater(CA).

The waste water treatment plant at Atwater, California, was expanded to meet extreme hydraulic and organic variations. The plant provides treatment services to a population of 15,000 and a cannery. Because treatment requirements varied considerably, due in part to the cannery operating schedule, the plant was expanded to include five possible treatment modes. These were: Primary clarifier-trickling filter-final clarifier, Primary clarifier-extended aeration basin-final clarifier, Primary clarifier-trickling filter-secondary clarifier-extended aeration basin-final clarifiers for domestic flow and extended aeration basins-final clarifiers for industrial flow, and Primary clarifier with secondary clarifier used as a primary clarifier-trickling filter-extended aeration basins-final clarifiers. The mode selection is determined by the frequency and organic character of the influent industrial BOD load. Maximum design loading when all unit processes are operating is 37,000 lb/day. The expansion of the plant cost 4.6 million dollars. Currently, BOD is averaging 10 mg/liter and suspended solids is 19 mg/liter. (Small-FRC)

TRACE ORGANIC BEHAVIOR IN SOIL COLUMNS DURING RAPID INFILTRATION OF SECONDARY WASTE WATER,
Stanford Univ., CA. Dept. of Civil Engineering.
E. J. Bouwer, P. L. McCarty, and J. C. Lance.
Water Research, Vol 15, No 1, p 151-159, January, 1981. 8 Fig, 2 Tab, 28 Ref.

Descriptors: *Waste water treatment, *Sorption, *Infiltration, *Ultimate disposal, *Organic compounds, Halogenated compounds, *Phoenix, Arizona, Disposal, Volatility, Biodegradation.

Removal of trace organic compounds from effluent was studied by applying tap water and secondary waste water from the City of Phoenix to soil columns at infiltration rates typical of high-rate land application (24-40 cm per day for waste water and 50 cm per day for tap water). Infiltration rates did not affect the degree of organic removals. The waste water contained chloroform, 1,1,1-trichloroethan, and tetrachloroethylene in the range of 1-10 micrograms per liter. The tap water contained 50 micrograms per liter chloroform and some different halogenated compounds. Breakthrough of chloroform occurred, but the other organic compounds were significantly removed. Compounds present in concentrations up to 1 microgram per liter which were identified in the influents and effluents included hydrocarbons, alcohols, ketones, aromatics, phthalates, chlorianted anisoles, pesticides, and unknown compounds. Some materials present in the effluents were not detected in the influent waste water. This may be a result of the soil colums having been previously used for similar studies. It is believed that bacterial secondary metabolism was probably responsible for organic removal, as well as sorption and volatilization. (Cassar-FRC)

NONLINEAR MODELS OF BIOLOGICAL TREATMENT PROCESSES,
Adademiya Nauk SSSR, Moscow. Inst. Vodnykh Problem.
V. A. Vavilin, and V. B. Vasiliev.
Ecological Modelling, Vol 9, p 57-71, February, 1980. 5 Fig, 18 Ref.

Descriptors: *Mathematical models, *Biological treatment, *Activated sludge, *Algae, Nutrients, Diffusion, Nonlinear models, Sewage treatment, *Waste water treatment.

Nonlinear models for the processes of biochemical oxidation of organic substances in activated sludge systems and for the removal of nutrients by algae in biological ponds are described. Monod's model is described; this entails a simple relationship and is often used in the cultivation of microorganisms. This simple nonlinear model can be derived from a consideration of kinetic transformations of the substrate in a cell. For activated sludge particles, it is necessary to consider the diffusion mechanism by which the substrate penetrates such particles. Models discussed include the steady-state diffusion model (Lee and Takamatsu, 1976) and Haldane's model. Nonlinear models can be adapted to allow the description of dynamic systems which have certain equilibrium states. Models should be sufficiently accurate within the range of variations determined by the conditions of application, and they should be as simple as possible. (Small-FRC)

REDUCED-ORDER MODELLING OF THE ACTIVATED-SLUDGE PROCESS,
Florence Univ. (Italy).
S. Marsili-Libelli.
Ecological Modelling, Vol 9, p 15-32, February, 1980. 8 Fig, 23 Ref.

Descriptors: *Mathematical models, *Activated sludge, *Predation, *Waste water treatment, Microorganisms, Statistical analysis, Computers, Control, Management, Italy.

A model for the activated sludge process is proposed, which considers the substrate-bacteria interaction as a prey-predator pair. The Volterra-Leslie equations (Maynard Smith, 1974) are used. The structural determination of this second order model is described. In calibration of the model, special emphasis was placed on field-data pretreatment. Power spectrum analysis was examined as a possible means of providing a guideline for smoothing. After calibration and validation, the sensitivity analysis showed that the model does not possess any critical parameter. This simpler structure model was compared with more complex models; the simpler model caused no major loss of accuracy. The model has several useful applications. It can be used on a small process computer as a state observer. It could help in plant control and management applications. Presently, the incorporation of dynamics for dissolved oxygen is being studied. (Small-FRC)

THE TREATMENT OF MIXED INDUSTRIAL AND DOMESTIC SEWAGE USING CHEMICAL AND BIOLOGICAL TREATMENT AT DAVY-HULME ADVANCED WASTE WATER TREATMENT PILOT PLANT,
Department of the Environment, London (England).
J. L. Vosser.
Progress in Water Technology, Vol 12, No 5, p 395-410, 1980. 4 Fig, 10 Tab.

Descriptors: *Activated sludge, *Chemical precipitation, *Industrial wastes, Domestic wastes, Municipal wastes, Activated carbon, Lime, Coagulation, Filtration, Treatment facilities, Performance, United Kingdom, *Waste water treatment, Manchester.

Chemical precipitation followed by activated sludge treatment and final adsorption with activated carbon was used to treat sewage containing a high proportion of industrial wastes. Sedimentation efficiency was evaluated using lime alone and using lime and aluminum sulfate. Results with lime alone were better or at least as good and were less expensive. Sedimentation periods of one hour or more resulted in 80% removal of suspended solids. High rate activated sludge treatment of the settled sewage produced an effluent which consistently had a maximum suspended solids level of 20 mg/liter and a biochemical oxygen demand of 20 mg/liter. Peak loadings were not a problem. The addition of aluminum as a coagulant aid virtually eliminated the scaling problems caused by lime. Effluent quality was improved further by dual media filtration and activated carbon treatment. Salmonellae were removed completely from the sewage through the use of lime. (Small-FRC)

TREATMENT OF COMBINED DOMESTIC AND INDUSTRIAL WASTE WATER IN GARLAND, TEXAS,
Texas Univ. at Dallas, Richardson.
A. Netzer, J. McNutt, and W. B. Dollar.
Progress in Water Technology, Vol 12, No 5, p 427-431, 1980. 1 Tab, 3 Ref.

Descriptors: *Treatment facilities, *Industrial wastes, *Municipal wastes, Sludge disposal, Biological treatment, Filtration, Carbon adsorption, Coagulation, Chlorination, Combined municipal and industrial wastes, Texas, *Waste water treatment, Garland.

The Duck Creek Waste water Treatment Plant in Garland, Texas, treats sewage from a city of 145,000 and industrial discharges from 265 light industries. The facility was recently expanded into a 22.5 MGD physical-chemical process in addition to the orginal 10 MGD biological process. The physical-chemical configuration consists of equalization, chemical coagulation, flocculation, precipitation, recarbonation, filtration, activated carbon adsorption, and disinfection. The biological treatment process consists of screening and degritting equipment, primary clarifier, trickling filters, and final clarifier. Carbon adsorption, disinfection, sludge dewatering, and scum disposal are combined for both processes. Sludge disposal is at a sanitary landfill. The city has experienced rapid growth, but the treatment needs have been met with this combined system. The new facility is both economically feasible and environmentally sound. (Small-FRC)

EFFICIENCY AND RATE OF ELIMINATION OF POLYCHLORINATD BIPHENYLS FROM WASTE WATERS BY MEANS OF ALGAE,
Ceskoslovenska Akademie Ved, Trebon. Lab. of Biotechnology.
K. Veber, J. Zahradnik, and I. Breyl.
Bulletin of Environmental Contamination and Toxicology, Vol 25, No 6, p 841-845, December, 1980. 1 Fig, 1 Tab, 8 Ref.

Descriptors: *Polychlorinated biphenyls, *Waste water treatment, *Algae, *Absorption, Phytoplankton, Municipal wastes, Farm wastes, Pollutants, Scenedesmus acutus, Chlamydomonas geitleri.

Polychlorinated biphenyls (PCB) were eliminated from municipal waste water and piggery waste water at efficiencies of up to 100% by algal concentration and subsequent lyophilization. Scenedesmus acutus was cultivated outdoors in southern Bohemia for 2-week periods during June-September, 1978, at average daily temperatures of 19.8C. Once a day a volume of the suspension was withdrawn and replaced by the same volume of waste water. Dilution rates and corresponding elimination efficiencies were as follows: 0.1, 100%; 0.2, 67%; 0.3, 80%; and 0.5, 45%. Similar studies done with Chlamydomonas geitleri at an average temperature of 17.8C in May and June 1979 showed 0.1, 84%; 0.2, 73%; 0.3, 64%; and 0.5, 100%. Although there was a trend toward decreasing efficiency of PCB absorption with increasing dilution rate, weather may also have been a factor. The PCB contents of the dry algal biomass at the maximum dilution rate were 213 mg per kg for S. acutus and 157 mg per kg for C. geitleri. (Cassar-FRC)

THE OXYGEN DEMAND OF SEWAGE,
T. Stones.
Effluent and Water Treatment Journal, Vol 20, No 9, p 437-440, September, 1980. 6 Tab, 20 Ref.

Descriptors: *Sewage treatment, *Oxygen demand, *Chemical oxygen demand, *Waste water treatment, Water quality control, Sewage, Sewage disposal, Water pollution treatment, Oxidation.

The oxygen demand of sewage is used as a basis for determining the concentration of oxidizable matter present in it, and therefore reflects its polluting character. This oxygen demand can also be used for assessing the loading and performance of sewage treatment plants. The complete biochemical oxidation of sewage occurs in two distinct stages. The first stage is oxidation of carbonaceous matter, and the second is oxidation of ammonia present from the beginning. Any practical method of providing an accurate measure of the carbonaceous oxygen demand of sewage must depend on the expeditious and complete oxidation of the carbonaceous matter. The recently developed chemical oxygen demand (COD) test, in which the amount of oxygen consumed from silver catalyzed dichromate is measured by the Dobbs and Williams modification, is such a method. Using the reduction in the total oxygen demand as an absolute measure of the purification effected during treatment, an assessment was made on the performance of a biological filtration plant and an activated sludge plant. The observed reduction in biochemical oxygen demand suggests that the activated sludge plant is giving a better performance than the filter plant. However, the reduction in total oxygen demand shows the filter plant to be far superior, due mainly to far better reductions in the nitrogenous oxygen demand due to nitrification as well as to a significantly better reduction in total carbonaceous oxygen demand. (Baker-FRC)

THE TERTIARY TREATMENT OF SEWAGES,
Loughborough Univ. of Technology (England).
K. V. Ellis.
Effluent and Water Treatment Journal, Vol 20, No 9, p 422-423, 425-428, 430, September, 1980. 27 Ref.

Descriptors: *Waste water treatment, *Sewage treatment, *Tertiary treatment, Filtration, Water pollution treatment, Sewage, Sewage disposal, Luton, *England.

Tertiary treatment usually refers to processes that primarily reduce the suspended solids content of a secondary effluent and, at the same time, reduce the level of the BOD. In general such treatment includes the use of microstrainers, grass plots, lagoons, sand filtration (slow, rapid gravity, and upward flow filtration), upward flow clarifiers and nitrifying filters. Grass plots are a simple and effective means of upgrading a poor effluent and consist basically of gently sloping areas of land covered either with specially sown, deep-rooted grasses or with natural flora. Slow sand filters are employed as three layers with the under drainage constructed of split tiles, open-jointed pipes or perforated unglazed pipes, laid with a slight fall toward a manifold. On top of these underdrains are layers of coarser media, on top of which is a sand layer. Rapid sand filters, while similar, employ coarser media, allowing the suspended matter to pass deeply into the bed before it is removed. The dual-media filter was developed to allow coarser, suspended solids in the filter feed to be removed in the coarser grains of the upper medium, allowing finer suspended solids to pass to the deeper sand mass before being removed. In the upward-flow filter the coarsest layer is at the bottom and the finest at the top, and the water filters from bottom to top. The use of backwashing to clean filters is also discussed. 15 YEARS PRACTICAL EXPERIENCE WITH DISSOLVED AIR FLOTATION (DAF),
Purac A. B., Lund (Sweden).
B. Rosen.
Water Services, Vol 84, No 1015, p 526-527, September, 1980. 3 Fig.

Descriptors: *Flotation, *Waste water treatment, *Tertiary treatment, Water pollution treatment, Sewage, Foaming, Sewage treatment.

Dissolved air flotation systems are designed for chemical treatment of surface waters for potable use as well as for advanced tertiary treatment of waste water. Hundreds of flotation plants are in operation, with capacities up to 16000 cubic meters per hour. Flotation involves the generation of extremely small bubbles, which attach to the solids to be separated, causing them to rise rapidly. The bubbles should have a diameter of 30-80 microns. The technique for generating these bubbles depends on controlled liberation of dissolved air. The aggregates rise to the water surface, forming a stable sludge blanket suspended above the water surface by the bubbles. The water is then drained downwards from the sludge. An example is given of removing algae by flotation in a potable water treatment plant, using water from the Ruhr river. Flotation is also used in the treatment of industrial and municipal waste waters and sewage, and for the separation and recovery of fibers. (Baker-FRC)

EVALUATION OF TREATMENT TECHNOLOGIES FOR WATER REUSE IN COAL GASIFICATION,
Carnegie-Mellon Univ., Pittsburgh, PA. Dept. of Civil Engineering.
R. G. Luthy, J. R. Campbell, L. McLaughlin, and R. W. Walters.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-182164, Price codes: A12 in paper copy, A01 in microfiche. Office of Water Research and Technology Report OWRT/RU-80/9, July, 1980. 248 p, 52 Fig, 40 Tab, 153 Ref, 18 Append. OWRT-C-80232-R(No 8815)(1), 14-34-0001-8815.

Descriptors: *Coal gasification, *Water reuse, *Waste water treatment, Industrial wastes, Waste disposal, Activated sludge, Coal conversion processes, Economic feasibility, Synthetic fuels.

This investigation assessed significant issues and conducted bench scale experiments pertinent to management and reuse of coal coking and coal gasification process waste waters. For the case of high-BTU coal gasification processes, the cooling tower is the most likely target for reuse of process waste water. Treatment studies were performed with high BTU pilot coal gasification process quench waters to evaluate enhanced organic removal via powdered activated carbon-activated sludge treatment, and to evaluate a coal gasification waste water treatment train comprised of sequential processing via ammonia removal, biological oxidation, lime-soda softening, granular activat-

ed carbon adsorption and reverse osmosis. Biological oxidation of coal gasification waste water showed excellent removal efficiencies at moderate loadings; addition of powdered activated carbon provided lower effluent COD and color. Gasification process waste water treated through activated carbon adsorption appears suitable for reuse as cooling tower make-up water. Screening studies indicate that reverse osmosis is an attractive technique for reducing waste water dissolved solids. Additional study is needed to determine quality constraints regarding acceptable waste water organic loading in cooling tower make-up water, and to evaluate possible release of toxic/hazardous organics to the environment via cooling tower drift. Additional follow-up work to this study is in progress to evaluate solvent extraction of gasification process waste waters to recover phenolics and to reduce priority organic pollutants.

ADVANCED TREATMENT OF ALUMINUM INDUSTRY EFFLUENT FOR NON-POTABLE REUSE,
Rexnord Inc., Milwaukee, WI. Environmental Research Center.
R. A. Osantowski, A. Geinopolos, J. E. Kane, and G. Rollinger.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-182289. Price codes: A08 in paper copy, A01 in microfiche. Office of Water Research and Technology Report OWRT/RU-80/15, January, 1981. 137 p, 17 Fig, 31 Tab, 12 Ref, Append. OWRT-C-90084-R(No 7805)(1), 14-34-0001-7805.

Descriptors: *Reverse osmosis, *Electrodialysis, *Demineralization, *Recycling, *Industrial wastes, Filtration, *Aluminum industry, Membrane life, *Non-potable reuse, Waste water renovation, Chemical flocculation/clarification.

This report presents the findings of a six month pilot plant study investigating non-potable reuse of aluminum plant waste water. The two demineralizing technolgies studied were reverse osmosis and electrodialysis. Pretreatment throughout the testing consisted of chemical flocculation/clarification and multimedia filtration. During the investigation, over 3,000 operating hours were put on each of the two desalting technology membranes to obtain information on membrane life expectancy. The most promising treatment technologies tested which meet the various non-potable reuse needs of the aluminum industry were determined by pilot plant performance. Potential water reuse applications were identified along with water quality and quantity requirements. Comparisons were made to the treated effluent quality achieved from each of the pilot process elements.
W81-02263

MAGNESIUM COAGULATION OF OXIDATION POND EFFLUENT,
Auburn Univ., AL. Dept. of Civil Engineering.
J. M. Morgan.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-182198. Price codes: A04 in paper copy, A01 in microfiche. Completion Report, December, 1980. 44 p, 13 Fig, 5 Tab, 27 Ref. OWRT-A-065-ALA(2), 14-34-0001-8001.

Descriptors: *Coagulation, *Flocculation, *Sedimentation, *Magnesium, *Algae control, *Oxidation ponds, Waste water treatment, Effluents, Laboratory tests, Evaluation.

A jar test procedure was utilized to investigate the effectiveness of magnesium for the removal of algae from aqueous suspension by a coagulation, flocculation and sedimentation process. Magnesium was shown to be an effective coagulant for laboratory grown cultures of Chlorella and Chlamydomonas as well as effluent from an operating municipal oxidation pond. The mechanism of coagulation was shown to be a combination of specific chemical interaction between algal cells and positively charged magnesium hydroxide floc and enmeshment in the hydroxide precipitate. The overall process was stoichiometric with the required magnesium dosage being dependent upon the inital volatile suspended solids concentration at all pH levels investigated.
W81-02267

LONG-TERM EFFECTS OF CHROMIUM AND COPPER ON THE ROTATING BIOLOGICAL CONTACTOR,
Oklahoma State Univ., Stillwater.
A. Keihani.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-182172. Price codes: A04 in paper copy, A01 in microfiche. MS Thesis, July, 1980. 51 p, 18 Fig, 18 Tab, 11 Ref. OWRT-A-087-OKLA(2), 14-34-0001-9038.

Descriptors: *Waste water treatment, Biological contactor, Heavy metals, Effluent, *Chromium, *Copper, Biological oxygen demand, Chemical oxygen demand, Organic carbon, Testing procedures, Evaluation.

This laboratory investigation studied the long-term effect of hexavalent chromium and divalent copper. Different concentrations of chromium (1mg/l, 5mg/l, and 10mg/l) and copper (3mg/l and 10mg/l) were used at each concentration. COD, TOC, and BOD tests were run. During each day these tests were run, the amount of these metallic ions was measured in the influent and effluent. This investigation found that the effect of chromium is not a function of time, and the results of the first and last day are the same. However, 10mg/l chromium concentration did upset the system, but chromium removal was as high as 1mg/l and 5mg/l. This investigation also found that the effect of copper on rotating biological contactors is not a function of time. Although a high copper removal was obtained, 10mg/l copper concentration deteriorated the systm completely, and the sludge was black during the period of analysis for this concentration.
W81-02269

LEACHATE QUALITY FROM LYSIMETERS TREATING DOMESTIC SEWAGE,
Hawaii Univ., Honolulu. Water Resources Research Center.
G. T. Tasato, and G. L. Dugan.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-182248. Price codes: A05 in paper copy, A01 in microfiche. Technical Report No 131, April, 1980. 86 p, 13 Fig, 26 Tab. OWRT-A-069-HI(2), 14-34-0001-7025, 8013.

Descriptors: *Sewage disposal, *Sewage treatment, *Lysimeter, *Waste water treatment, *Domestic wastes, Soil treatment, Cesspools, *Hawaii, *Oxisol, *Inceptisols, *Entisols, Wahiawa series, Lahaina series, Tantalus series, Jaucas series, Oahu.

A study was undertaken to determine the treatability of raw domestic wastes using waste water treatment lysimeters. A pilot treatment unit was constructed that included four waste water treatment lysimeters, each utilizing a different Hawaiian soil. The soils included two silty clays of the Wahiawa and Lahaina series, a silty loam of the Tantalus series, and a beach sand of the Jaucas series. The use of graded rocks or gravel was incorporated in all of the soil series with the exception of the Wahiawa series. The Wahiawa and Lahaina soil lysimeters employed a top surface application scheme while the Tantalus and Jaucas lysimeters utilized a lateral flow scheme. Two residential cottages served as the domestic waste water source and produced flows ranging from 3.15 to 5.04 x 10 super 6 m super 3/s (72-115 gpd). In general, the Tantalus and Jaucas series attained relatively higher removal efficiencies than the Wahiawa and Lahaina series. However, in all of the soil series, only moderate constituent removals were observed particularly for dissolved solids, organics, ammonia nitrogen,and bacteria. The only constituents which showed high removals were suspended solids and phosphorus. The primary factor for the low overall removals was probably overloading of the lysimeters inasmuch as both the hydraulic and constituent loadings (especially organics, solids, nitrogen, and bacteria) proved to be excessive. Soil clogging was also evident to some extent in all of the soil series.

5E. Ultimate Disposal Of Wastes

TRENDS IN LIQUID SLUDGE MANAGEMENT IN THE NIERS REGION,
Niersverband, Viersen (Germany, F.R.).
G. Kugel.
Progress in Water Technology, Vol 12, No 5, p 685-691, 1980. 1 Fig, 2 Tab, 5 Ref

Descriptors: *Sludge treatment, *Sludge disposal, *Soil disposal fields, Heavy metals, Copper, Transportation, Arable land, Pastures, Pasteurization, Niers River, Federal Republic of Germany.

Recycling liquid sludge to land is part of the Niers river basin management system of the Niersverband, West Germany. Thickened and mostly anaerobically stabilized sludge, about 450,000 cu m/year, is applied to land at an application rate of 100 cu m/ha. The sludge is collected from 30 sewage treatment plants and transported by truck to arable or pasture land. Sludge constituents including heavy metals are monitored by the Niersverband laboratory. Sludges with concentrations of metals above limits set by the federal government are not disposed of on land without permission of supervising authorities. A sludge application of 100 cu m/ha using sludge with a total copper content of about 1000 ppm raises the copper content of the soil by about 2 ppm. Better thickening and homogenization of the sludge and optimization of the transport system by using 19 cu m tankers are suggestions for future improvement of the sludge disposal scheme. Sludge pasteurization concentrated at large plants with sufficient digester gas supply is being evaluated. (Small-FRC)

THE TREATMENT OF INDUSTRIAL WASTE WATER SLUDGE FROM A BIOLOGICAL PURIFICATION PLANT WITH COMPLETE N-REMOVAL,
DSM's Central Lab., Geleen (Netherlands). Environmental Research Dept.
E. W. Hendrikx.
Progress in Water Technology, Vol 12, No 5, p 351-357, 1980. 1 Fig, 4 Tab, 2 Ref.

Descriptors: *Sludge treatment, *Sludge disposal, *Neutralization, Lime, *Nitrogen removal, Fertilizers, Industrial wastes, Chemical industry, Dewatering, Drying, Nutrients, Soil disposal fields, *Netherlands.

Sludge treatment and disposal methods used at a chemical plant are reviewed. Purification of waste water from DSM's chemical plants is effected using a low-load activated sludge plant with a capacity of approximately 1 million population equivalents. The quality of the sludge produced depends on the neutralizing agent used. Sludge obtained after the addition of NaOH was less capable of being thickened than when CaO was used. Drying was the only sludge treatment method suitable for a sludge with high lime content. Mechanical dewatering and thermal drying were evaluated. The sludge was analyzed to see if it was suitable for use as a fertilizer. Sludge produced using NaOH was rich in nutrients, but it was decided to use CaO, which produces a larger quantity of sludge with less nutrients. At present the sludge is used as a liming agent for acid soils. Sludge that cannot be spread on land is dried using a thermal drying method. Sludge concentrations are kept below certain levels to avoid pump failures when the sludge is pumped from the water treatment plant to the sludge treatment plant. Also, sludge in the storage tanks is stirred to keep the concentration even. (Small-FRC)

SLUDGE DISPOSAL PRACTICES IN THAMES WATER AUTHORITY,
Thames Water Authority, London (England).
W. J. Dickens.

Progress in Water Technology, Vol 12, No 5, p 341-350, 1980. 1 Fig, 5 Tab, 3 Ref.

Descriptors: *Sludge disposal, *Sludge treatment, *Soil disposal fields, Municipal wastes, Heavy metals, Monitoring, Incineration, Anaerobic digestion, Filtration, *Thames Water Authority, United Kingdom.

The sizes and types of sewage treatment works and the quantities and types of sludge produced are described for the Thames Water Authority. The authority treats 213,200 tons/year of sludge by anaerobic digestion, 25,800 tons/year by filter press, 8900 tons/year by vacuum filter, 4400 tons/year by raw application to land, and 1600 tons/year other. Disposal is by land application for agricultural purposes (123,000 ton/year), sea discharge (131,000 tons/year), and incineration (2400 tons/year). Most of the liquid sludge applied to land is in the digested form, and direct surface spreading has not led to any enviromental problems with respect to odor. There are restrictions on metal concentrations in sludge for zinc, cadmium, lead and mercury. Thus, sludge and soil to which sludge has been applied are monitored for metal content. Sludge is sampled daily and measured for nitrogen, phosphorus, dry solids, total cadmium, copper, lead, zinc, and chromium. (Small-FRC)

THE PRAIRIE PLAN - THE FIRST DECADE, THE SECOND DECADE - THE UNITED STATES' LARGEST RECYCLING SYSTEM,
Metropolitan Sanitary District of Greater Chicago, IL.
N. J. Melas.
Progress in Water Technology, Vol 12, No 5, p 331-340, 1980.

Descriptors: *Soil disposal fields, *Agriculture, *Fertilizers, *Sludge disposal, Municipal wastes, Industrial wastes, Digestion, Nitrogen, Phosphorus, Crop production, Illinois, Metropolitan Sanitary District of Greater Chicago, *Chicago.

Digested waste water solids are recycled at the Metropolitan Sanitary District of Greater Chicago's Prairie Plan site. This water management district is responsible for domestic wastes produced by a population of 5,500,000 and an additional industrial waste load of 2 billion gallons per day. During the 1960's, the district used heat drying to treat sludge and then sold the material as a fertilizer base. This process caused air pollution, and was replaced by a program to use the solids to enrich agricultural lands. Through the end of 1978, 12.9 million wet tons of sludge have been barged to a site in Fulton County. The tandem disc has been the most satisfactory method of incorporating the sludge. The district purchased a 300 HP rock crushing soil stabilizer which may perform better than the tandem disc. The fertilizer is rich in nitrogen and phosphorus. In 1978, the application site produced 36,685 bushels of corn, 2247 bushels of soybeans, 101,797 bales of hay, and 500 bushels of rye. Processing and distribution costs were as follows in 1978: digestion $47/dry ton, barging $48/dry ton, and application $83/dry ton. (Small-FRC)

DISPOSAL OF SECONDARY SLUDGE IN THE KRAFT RECOVERY SYSTEM,
Institute of Paper Chemistry, Appleton, WI.
W. J. Frederick, T. M. Grace, and T. W. Joyce.
Tappi, Vol 64, No 1, p 59-62, January, 1981. 1 Fig, 6 Tab, 6 Ref.

Descriptors: *Disposal, *Pulp wastes, *Incineration, *Sludge disposal, Economics, Waste water treatment, Pulp and paper industry, Cost estimates, Energy, Evaporators.

Secondary sludge from pulp and paper mills was pretreated with white liquor and added to the weak black liquor prior to the evaporation step and subsequent disposal by incineration. Most of the insoluble material (Ca, Mg, and P) was removed with the dregs. Chloride levels in the effluent were low for unbleached kraft mills (0.2 to 88 ppm) but were 297 ppm for bleached kraft mills. These levels were reduced by dewatering the sludge to 5-10% solids. Aluminum accumulation could cause evaporator fouling and interfere with causticizing. This problem was not solved in this study. The rate of evaporator fouling was reduced by 93-99% when the secondary sludge was predigested with the white liquor. Energy balances showed that the energy break-even point for 15 kg of sludge solids per absolutely dry ton added to the weak black liquor was 5.5% solids when predigesting at pH 13 and 100C; 4.4% solids when predigesting at pH 12.3 and 100C. Costs of the process decreased as predigestion temperature dropped and as the pH dropped below 13. Costs also declined with sludge dewatering in the range of 1 to 5%. Dewatering to above 10% was not cost-justified. (Cassar-FRC)

FATE OF PETROLEUM HYDROCARBONS IN SEWAGE SLUDGE AFTER LAND DISPOSAL,
National Water Research Inst., Burlington (Ontario).
D. Liu.
Bulletin of Environmental Contamination and Toxicology, Vol 25, No 4, p 616-622, October, 1980. 3 Fig, 13 Ref.

Descriptors: *Sludge, *Sewage, *Organic compounds, *Agriculture, *Soil disposal fields, Heavy metals, Toxicity, Oil, Soil properties, Soil testing, Gas chromatography, Analytical techniques, Lysimeters, Moisture content.

Results of a study of farmland disposal of sewage sludge are presented. High concentrations of petroleum hydrocarbons have been detected in sewage sludge and are known to be toxic to plants because of their damaging effects on photosynthesis. The vertical distribution of sludge petroleum hydrocarbons observed in silt loam soils one year after application demonstrates a high capacity for the soil to degrade and retain the lipophilic substances. Sludge also enhances the biological activity of the soil, further accelerating the degradation of hydrocarbons. It is thought that under normal sludge application conditions, hydrocarbon buildup to any significant level would be unlikely. Further investigation of long-term effects is recommended. (Titus-FRC)

ROOT ZONE NITROGEN SIMULATION MODEL FOR LAND APPLICATION OF SEWAGE SLUDGES,
Illiois Inst. of Tech., Chicago. Pritzker Dept. of Environmental Engineering.
P. O'Brien, and W. J. Mitsch.
Ecological Modelling, Vol 8, p 233-257, January, 1980. 14 Fig, 3 Tab, 59 Ref.

Descriptors: *Sewage sludge, *Model studies, *Root zone, Nitrogen, Effects, Fertilizers, Nitrate, Leaching, Kinetics, Crop production, Soil amendments, Nitrogen compounds, Sludge treatment, Simulation analysis, Nutrients, Waste disposal.

A root zone nitrogen simulation model was designed to evaluate long term effects of various sewage sludge and ammonia nitrogen fertilizer applications upon soil root zone nitrogen effects. Specific effects studied were root zone nitrogen build-up, crop nitrogen uptake (as a percentage of applied nitrogen), crop yield and nitrate nitrogen leaching. Model results showed that nitrate nitrogen leaching had a direct linear relationship to the simulated sludge application rates. For each metric ton of sludge incorporated into the farm soils, the leaching rate increased 21 kilograms/ha/year. The leaching rate increased 22 kilograms/ha/year for each metric ton of sludge incorporated into the stripmine soils. Leaching rates 50% lower than incorporation amounts resulted from surface application of sludge. The maximum uptake of nitrogen was determined from Michaelis-Menten/Monod kinetics to be 135 kilograms/ha/year for an incorporated loading rate of 25 metric tons/ha/year. Over a 50 year period organic nitrogen in the root zone build-up due to sludge application rates of 25 metric tons/ha/year would range from 8,400 to 10,000 kilograms/ha, depending on the site. Simulated application of 300 kilograms/ha/year of ammonia nitrogen gave a 98 kilogram/ha/year crop nitrogen yield, representative of an average yield for the US corn belt. Most of the model findings were in agreement with literature values. (Geiger-FRC)

PALEOHYDROLOGY OF THE SOUTHERN GREAT BASIN, WITH SPECIAL REFERENCE TO WATER TABLE FLUCTUATIONS BENEATH THE NEVADA TEST SITE DURING THE LATE( ) PLEISTOCENE,
Geological Survey, Reston, VA. Water Resources Div.
I. J. Winograd, and G. C. Doty.
Available from the OFSS, USGS Box 25425, Fed. Ctr., Denver, CO 80225, Price: $12.50 in paper copy, $3.50 in microfiche. Geological Survey Open-File Report 80-569, 1980. 91 p, 23 Fig, 3 Tab, 52 Ref.

Descriptors: *Paleohydrology, *Aquifer characteristics, *Radioactive waste disposal, *Great Basin, *Nevada, Water table, Water level fluctuations, Groundwater movement, Underground waste disposal, Underground storage, Path of pollutants, Hydrogeology, Pleistocene epoch, *Nevada Test Site(NV), *Ash Meadows(NV), Unsaturated zone.

Knowledge of the magnitude of water-table rise during Pleistocene pluvial climates, and of the resultant shortening of groundwater flow path and reduction in unsaturated zone thickness, is mandatory for a technical evaluation of the Nevada Test Site (NTS) or other arid zone sites as repositories for high-level or transuranic radioactive wastes. The distribution of calcitic veins filling fractures in alluvium, and of tufa deposits between the Ash Meadows spring discharge area and the Nevada Test Site indicates that discharge from the regional Paleozoic carbonate aquifer during the Late( ) Pleistocene pluvial periods may have occurred at an altitude about 50 meters higher than at present and 14 kilometers northeast of Ash Meadows. Use of the underflow equation (relating discharge to transmissivity, aquifer width, and hydraulic gradient), and various assumptions regarding pluvial recharge, transmissivity, and altitude of groundwater base level, suggest possible rises in potentiometric level in the carbonate aquifer of about -90 meters beneath central Frenchman Flat. During Wisconsin time the rise probably did not exceed 30 meters. Water-level rises beneath Frenchman Flat during future pluvials are unlikely to exceed 30 meters and might even be 10 meters lower than modern levels. Neither the cited rise in potentiometric level in the regional carbonate aquifer, nor the shortened flow path during the Late( ) Pleistocene preclude utilization of the NTS as a repository for high-level or transuranic-element radioactive wastes provided other requisite conditions are met as this site. Deep water tables, attendant thick (up to several hundred meter) unsaturated zones, and long groundwater flow paths characterized the region during the Wisconsin Stage and probably throughout the Pleistocene Epoch and are likely to so characterize it during future glacial periods. 5F. Water Treatment and Quality Alteration

THE OCCURRENCE OF CLOSTRIDIUM BOTULINUM IN RAW-WATER STORAGE AREAS AND THEIR ELIMINATION IN WATER TREATMENT PLANTS,
Rijsinstituut voor de Volskgezondheid, Bilthoven (Netherlands). Lab. for Zoonosen Lebensmittelmikrobiology.
S. Notermans, A. H. Havelaar, and J. Schellart.
Water Research, Vol 14, No 11, p 1631-1635, November, 1980. 4 Tab, 16 Ref.

Descriptors: *Filters, *Water purification, *Clostridium, *Raw water, Water quality, *Water treatment, Public health, Sludge, Sands, Water quality control, Ozone, Bioassays, *Netherlands, Reservoirs, Potable water.

Large scale outbreaks of waterfowl botulism in 1976 in the Netherlands have raised questions about the effectiveness of Clostridium botulinum removal by three water treatment plants. The Leiduin, Weesperkarspel and Kralingen treatment plants each receive water from three storage areas where C. botulinum was detected in bottom mud samples. The extent of removal of the bacterium by routine treatment operations of the plants was examined, and model experiments were conducted to evaluate the efficiency of slow sand filters in removing Clostridium spores. Samples were taken from coagulation sludge and the upper layers of filters in all three plants and also from the bottom sediments of ozone treatment chambers from the Weesperkarspel plant. The presence of C. botulinum was determined by mouse antiserum bioassays. Results of the three-year investigations (1977-1979) indicated that slow sand filters were adequate for retaining C. sporogenes spores. In two of the plants, the Weesperkarspel and Kralingen plants, C. botulinum was found only in the early purification stages. At the Leiduin facility, Clostridium bacteria were also detected on the slow sand filters, the last step of purification. The bacterium was detected in only the upper sand layers of this plant, and was never found in the filter water of any of the three treatment facilities. (Geiger-FRC)

OPERATING EXPERIENCES WITH DISSOLVED AIR FLOTATION ON VARIOUS RAW WATERS,
Water Research Centre, Marlow (England). Medmenham Lab.
A. J. Rees, D. J. Rodman, and T. F. Zabel.
Aqua, Vol 8, p 0170-0177, 1980. 8 Fig, 10 Tab, 5 Ref.

Descriptors: *Flotation, *Dissolved air flotation, *Water treatment, Filtration, Coagulation, *United Kingdom, Sludge, *Pilot plants, Flocculation, Turbidity, Water quality, Algae, Surface waters, Separation techniques.

Raw surface waters with different characteristics were treated with a 95 cu meter per hour dissolved air flotation process in large-scale pilot plant studies. Five waters underwent primary clarification at five separate treatment works in the United Kingdom. Flotation was especially effective in two types of water--stored water containing heavy algal loads and soft, stored, low turbidity, highly-colored water. Treatment of two low turbidity waters produced difficulties in floc formation. High turbidity water required extra air. Rapidly changing raw water qualities caused difficulties in adjusting doses of chemicals; storage is suggested in this situation. Dissolved air flotation plants can operate at a surface loading of up to 12 meters per hour, with a start-up time of 45 min. Flocculation time was 12-20 min. (Cassar-FRC)

PLAYGROUND AND WTP ARE GOOD NEIGHBORS,
R. P. Baker.
Water and Wastes Engineering, Vol 17, No 11, p 47-50, November, 1980. 1 Fig, 4 Tab.

Descriptors: *Treatment facilities, *Water treatment, *Recreation facilities, Parks, Water softening, Chlorination, Disinfection, Potable water, Ohio, Orbison Park.

A 10 mgd lime-soda softening water treatment plant was built in Orbison Park, a heavily used public park in Sidney, Ohio. The treatment process includes pretreatment with activated carbon, chlorine, or chlorine dioxide; coagulation/flocculation; lime-soda softening; clarification; recarbonation; and disinfection. Water also flows through ozonation basins to be equipped when ozonation becomes justifiable. The raw water pumping station and the sludge lagoon are located in the park. The new plant has a pleasing and unobtrusive design. Tennis courts are built on the clear well, and dust, noise and odor problems are minimized. During its first year of operation, the plant has supplied Sidney with high-quality water at adequate pressures. The park system has also been measurably improved. (Small-FRC)

5G. Water Quality Control

A DILUTION MODEL APPLIED TO A SYSTEM OF SHALLOW EUTROPHIC LAKES AFTER DIVERSION OF SEWAGE EFFLUENTS,
Uppsala Univ. (Sweden). Inst. of Limnology.
I. Ahlgren.
Archiv fur Hydrobiologie, Vol 89, No 1/2, p 17-32, June, 1980. 7 Fig, 5 Tab, 35 Ref.

Descriptors: *Model studies, *Eutrophication, Phosphorus compounds, *Eutrophic lakes, Nitrogen compounds, *Sewage effluents, Waste dilution, *Sweden, Lakes, Limnology, Chlorophyll, Photosynthesis, Nutrients, Mathematical studies, Sediments, Winds, Algae, Water pollution control, Path of pollutants.

A simple hydraulic dilution model was used to compare predicted nitrogen and phosphorus concentrations with those observed in a chain of four heavily eutrophicated shallow lakes north of Stockholm, Sweden, after all sewage effluents were diverted in 1970. Total P loadings were reduced by 80-90%, and total N loadings by 50-90%. The model successfully predicted P concentrations using a sediment retention coefficient of zero, but nitrogen fixation and denitrification produced differences between calculated and observed N concentrations. The average annual amplitudes in P levels were correlated with wind fetch over lake surface divided by mean depth, thus showing that differences among the lakes may depend on wind-generated turbulence at the sediment surface. Nitrogen was the limiting factor in chlorophyll a concentration. The deepest of the four lakes showed decreased chlorphyll contents and increased Secchi disc transparencies since 1974. The other lakes did not have this tendency; in fact, algal blooms have been more severe in recent years. (Cassar-FRC)

NONPOINT POLLUTION CONTROL -- TOOLS AND TECHNIQUES FOR THE FUTURE, PROCEEDINGS OF A TECHNICAL SYMPOSIUM.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-182156. Price codes: A14 in paper copy, A01 in microfiche. Symposium held in Gettysburg, PA, June 11-13, 1980. Interstate Commission on the Potomac River Basin, Rockville, Maryland. Technical Publication 81-1, January, 1981. 299 p. OWRT-C-90054-T(No 9615)(1).

Descriptors: *Nonpoint pollution sources, *Water pollution sources, *Water pollution control, *Potomac River basin, Best management practices, Urban Runoff, Agricultural runoff, Erosion control, Sediments, Land use, Pesticides, Eutrophication, Model studies, Mine drainage, Soil erosion, Farm wastes, Effluents, Virginia.

Thirty-two papers given at the symposium by experienced investigators in nonpoint water pollution are presented. Nonpoint water pollution, pollution from diffuse sources such as runoff from agriculture, forestry, and urban land development, accounts for up to 50% of the pollution in some rivers. Past water pollution control has emphasized point sources, and much progress has been made with these sources. Section 208 of the Federal Water Pollution Control Act Amendments has focused pollution control efforts on the identification and control of nonpoint sources. The papers are classified in five categories: (1) perspectives on nonpoint pollution control, (2) case studies of nonpoint sources of pollution, (3) modeling tools for evaluation of nonpoint pollutants, (4) control measures, and (5) planning and implementation strategies. A majority of the papers deal with the Potomac River basin and, in particular, the Occoquan watershed in Virginia. (See W81-02277 thru W81-02308) (Seigler-IPA)

NONPOINT POLLUTION CONTROL FROM THE STANDPOINT OF RESEARCH,
Office of Water Research and Technology, Washington, DC.
G. Cobb.
In: Nonpoint Pollution Control -- Tools and Techniques for the Future, Proceedings of a Technical Symposium, p 7-10, 1981.

Descriptors: *Nonpoint pollution sources, *Research priorities, *Water pollution control, *Water pollution sources, Acid rain, Erosion, Marshes, Wetlands, Pathways, Pesticides, Urban runoff, Land use, Eutrophication, Environmental effects, Cycling, Sediments.

Nonpoint pollution of the nation's waterways and of groundwater represents a group of research priorities that are recognized by the Department of the Interior's Office of Water Research and Technology (OWRT). OWRT is charged with 'assuring an adequate supply of water of good quality for the nation's needs through water-related research and practical application of R and D results.' OWRT supports 54 water research centers and a focused research program; it also operates the Water Resources Scientific Information Center. Nonpoint pollution research is needed to identify the source, amount, and impacts of the pollutants entering our water resources from a variety of land use activities. A knowledge of the fate and cycling of nitrogen and phosphorus is needed along with more information about the fate and pathways of the over one billion pounds of pesticides manufactured in the United States every year. Other nonpoint pollution research areas include environment transport analysis, the limits of environmental protection, application methods, marshes and wetlands as barriers to contamination, erosion and sediment control, and acid rain. Research is the key to the solution of nonpoint pollution problems. (See also W81-02276) (Seigler-IPA)
W81-02277

NATIONAL PERSPECTIVES ON NONPOINT POLLUTION CONTROL,
Environmental Protection Agency, Washington, DC. Water Planning Div.
C. Myers.
In: Nonpoint Pollution Control -- Tools and Techniques for the Future, Proceedings of a Technical Symposium, p 11-16, 1981.

Descriptors: *Nonpoint pollution sources, *Water pollution sources, *Federal project policy, *Research priorities, Urban runoff, Agriculture, Groundwater, Water pollution control, Best management practices, Grants, Government finance,

Research and development, Pesticides, Government supports.

Nonpoint pollution control is being increasingly recognized in Washington as a problem that needs action. New initiatives are being taken in this area by Congress, the Environmental Protection Agency (EPA), the Agriculture Department, the Department of Interior, and other Federal agencies. EPA's Section 208 and its grant funds are aimed directly at nonpoint pollution with emphasis on urban runoff, agricultural runoff, and groundwater contamination. EPA has developed the National Urban Runoff Program to prepare a data base on the costs and impacts of urban runoff pollution and controls. Thirty prototype projects to test control methods are being supported by Section 208. Initial 208 plans indicate that agricultural runoff is the most widespread cause of nonpoint pollution. Government agencies are aiding farmers and ranchers in the implementation of best management practices. Groundwater protection research is being funded as part of the Water Quality Management Program. The understanding of a wide range of public agencies and public interest is needed for success in nonpoint pollution control. (See also W81-02276) (Seigler-IPA)
W81-02278

A LOCAL RURAL PERSPECTIVE ON NONPOINT POLLUTION CONTROL,
Brooke-Hancock-Jefferson Metropolitan Planning Commission, Weirton, WV.
J. Louthan.
In: Nonpoint Pollution Control -- Tools and Techniques for the Future, Proceedings of a Technical Symposium, p 26-29, 1981.

Descriptors: *Farm wastes, *Nonpoint pollution sources, *Water pollution control, *West Virginia, Agriculture, Best management practices, Soil erosion, Fertilizer, Pesticides, No-till farming, Farm equipment, Domestic animals, Agricultural engineering, Water pollution sources.

The Environmental Protection Agency has approved West Virginia's agriculture 208 plan which addresses nonpoint source pollution in three major areas: land management, nutrient management, and animal wastes management. In the past 40 years much progress has been made in land management and, in Jefferson County, West Virginia, approximately 90% of all row crops are now grown by the no-till methods which produce one tenth the erosion of conventional tillage methods. Despite this progress, more research is needed on chemical application and alternative methods to pest control. Inflation and rising energy costs have done much to promote nutrient management, however, efficient use of fertilizer demands proper calibration of expensive equipment and excellent management practices on the part of the farmer. Animal waste handling systems are working well but they are expensive and cannot be justified through operational efficiency alone. Another area of concern to farmers is that of sludge application to farm land, which is viewed very negatively. (See also W81-02276) (Seigler-IPA)
W81-02281

A LOCAL URBAN PERSPECTIVE ON NONPOINT POLLUTION CONTROL,
Montgomery County Council, Rockville, MD.
N. Potter.
In: Nonpoint Pollution Control -- Tools and Techniques for the Future, Proceedings of a Technical Symposium, p 30-34, 1981. 1 Fig.

Descriptors: *Maryland, *Potomac River, *Nonpoint pollution sources, *Urbanization, Sewage treatment, Effluents, Sludge, Education, Monitoring, Modeling, Water pollution control, Water pollution sources, Regulations, Cities.

Areas requiring attention from the urban perspective on nonpoint pollution control include education, monitoring, modeling, and a more balanced attitude about pollution problems. Montgomery County, Maryland, has experienced many problems in its attempt to reduce the pollution of the Potomac River while still providing needed utility services to this urban area. A major problem area is that of sewage treatment for a large urban area and the resulting effluent and sludge. Past emphasis has been placed almost entirely on point source pollution to the Potomac River while nonpoint pollution has been neglected despite its magnitude. An equitable formula for reducing nonpoint pollution will be difficult to develop. At present, much can be done if farmers and developers use best management practices. There is also a great need for more public and official education so that in the future the programs that are enacted will be more economical, rational, and related to the problem to be solved. (See also W81-02276) (Seigler-IPA)
W81-02282

THE PUBLIC'S PERSPECTIVE ON NONPOINT SOURCES,
Capitol Region Planning and Development Agency, Harrisburg, PA.
R. K. Hoffman.
In: Nonpoint Pollution Control -- Tools and Techniques for the Future, Proceedings of a Technical Symposium, p 35-38, 1981. 2 Tab.

Descriptors: *Pennsylvania, *Nonpoint pollution sources, *Water pollution sources, *Water pollution control, Acid mine water, Urban runoff, Agriculture, Erosion, Construction, Advisory councils, Regulation, Water quality, Coal mine wastes, Coal mines, Water conservation, Education.

Pennsylvania's 208 planning effort, the Comprehensive Water Quality Management Plan (COWAMP) has ranked the five major nonpoint sources of water pollution as: (1) agricultural runoff, (2) urban runoff, (3) construction-site runoff, (4) contamination from malfunctioning on-lot disposal systems, and (5) acid mine drainage. COWAMP uses three public information devices, advisory committee meetings, public workshops on the county level, and a bimonthly water quality newsletter. Input from the workshops and from the advisory councils shows that the public's perspective on nonpoint sources depends upon where they live. To farmers, the preservation of prime farmland in a time of increasing development is a major concern. Those in urban areas feel that better planning and enforcement of the Stormwater Management and Floodplains Management Acts will help to control urban and construction-site runoff. The advisory committees recommend an intensive public education program coupled with more stringent enforcement of existing regulations on nonpoint source pollution. (See also W81-02276) (Seigler-IPA)
W81-02283

STRATEGIES FOR CONSIDERING POINT AND NONPOINT CONTROL TRADEOFFS FOR THE UPPER POTOMAC ESTUARY,
National Capitol Region Transportation Board, Washington, DC. Dept. of Environmental Programs.
M. Sullivan, S. Freudberg, and C. Wiegand.
In: Nonpoint Pollution Control -- Tools and Techniques for the Future, Proceedings of a Technical Symposium, p 225-244, 1981. 8 Fig, 1 Tab, 13 Ref.

Descriptors: *Nonpoint pollution sources, *Potomac River, *Optimization, *Efficiencies, *Cost-benefit analysis, Feasibility studies, Federal funding, Upstream loading, Point sources, Effluents, Water pollution sources, Water pollution, Urbanization, Cities.

The Metropolitan Washington Council of Governments (MWCOG) is investigating the possibilities for cost-effective tradeoffs between further control of point source effluents versus nonpoint pollution control in order to determine the optimal blend of controls for the Potomac estuary. Over the last decade point source loadings have been decreased significantly in accordance with the Clean Water Act. This decrease has increased the importance of local nonpoint and upstream loadings. As part of MWCOG's investigation, average annual pollutant loads and the effectiveness of nonpoint control alternatives were compared to currently mandated point source controls. The comparison shows that upstream loading from beyond the metropolitan area is the largest of all loading sources for the estuary, indicating that State nonpoint source control programs are needed. Tradeoffs between local point and nonpoint control alternatives may be cost-effective and further analysis is warranted. Non-structural practices appear to be very cost-effective. Should tradeoff analysis indicate the need for nonpoint source control programs, Federal funding will be needed for local jurisdictions. (See also W81-02276) (Seigler-IPA)
W81-02301

THE DEVELOPMENT AND CONTENT OF THE AGRICULTURAL COMPONENT OF THE MARYLAND 208 PLAN,
Soil Conservation Service, College Park, MD.
W. A. Knight.
In: Nonpoint Pollution Control -- Tools and Techniques for the Future, Proceedings of a Technical Symposium, p 245-251, 1981. 7 Ref.

Descriptors: *Agricultural runoff, *Nonpoint pollution sources, *208 plans, *Maryland, Mapping, Soil conservation, Erosion, Farm wastes, Water pollution sources, Water pollution, Programs, Planning, Best management practices, Workshops, Information systems, Watershed protection.

The program for management of agricultural nonpoint sources in Maryland consists of a voluntary effort with the State Soil Conservation Committe and soil conservation districts, with The Maryland Water Resources Adminiistration having the enforcement authority. The program is identifying critical erosion and animal waste problem areas where soil conservation and water quality plans will be implemented. The program has developed assessment procedures and best management practices so that landowners can prepare their own individual plans. An information management system has been developed to help identify critical areas, to aid in the refinement of the implementation program, and to report progress. As part of this information system a mapped inventory of managerial and physical information on State farmland has been developed. Through the use of color codes, the maps provide an instantaneous overview of the conservation treatment status of any watershed. Maryland has received tentative Environmental Protection Agency approval of its agricultural 208 plan. (See also W81-02276) (Seigler-IPA)

THE STATEWIDE 208 NONPOINT SOURCE CONTROL PROGRAM FOR VIRGINIA,
Virginia Polytechic Inst. and State Univ., Blacksburg. Dept. of Civil Engineering.
E. Sutherland.
In: Nonpoint Pollution Control--Tools and Techniques for the Future, Proceedings of a Technical Symposium, p 294-299, 1981. 10 Ref.

Descriptors: *Virginia, *Nonpoint pollution sources, *Best management practices, Urban runoff, Agricultural runoff, Forest management, Dredging, Mining, Stormwater runoff, Erosion control, Sedimentation, Water pollution control, Water pollution sources, Saltwater intrusion, Handbooks.

The Virginia State Water Control Board has developed six handbooks outlining the Best Management Practices (BMP) to reduce nonpoint pollution from various land use catergories. The handbooks provide planning considerations, design criteria, and recommended construction specifications for every practice. The Agricultural BMP Handbook considers three practices: erosion and sediment control, pesticide and fertilizer control, and animal waste management methods. The Forestry BMP Handbook gives information of access roads and trails, site preparation, harvesting control, and pesticide controls. The Urban BMP Handbook covers good housekeeping methods, stormwater runoff controls, and sewer system management. The Hydrologic Modification Handbook covers the reduction of the ecological impact of channel modifications, dredging, spoil disposal, and good reservoir management. The Sources Affecting Groundwater Handbook includes the prevention

of saltwater intrusion. The Surface Mining Hankbook covers sediment runoff from coal and other mineral mining. (See also W81-02276) (Seigler-IPA)

CONTROL OF TOXICS IN THE UNITED STATES,
Corvallis Environmental Research Lab. OR.
J. C. McCarty.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-173825, Price codes: A13 in paper copy, A01 in microfiche. In: Management of Bottom Sediments Containing Toxic Substances, Proceedings of the Fifth United States-Japan Experts Meeting, Nov., 1979, New Orleans, LA. Environmental Protection Agency Report EPA-600/9-80-044, Sep., 1980, p37-44. 1 Tab, 11 Ref.

Descriptors: *Legislation, *Federal jurisdiction, *Water pollution control, *Toxins, *Water pollution standards, Toxicity, Pollution abatement, Environmental control, Industrial wastes, Air pollution, Water pollution, Soil contamination, Ecosystems, Waste disposal.

In recent years many federal laws have been enacted, and existing laws amended, in response to increasing incidents of toxic substances appearing in the food, air, water, and soil of the United States. The early legislation focused on controlling pollution in a medium after the pollutant had been generated. The methods included setting ambient air standards or receiving water standards and specific emission or discharge standards to limit the amount of a pollutant allowed into the environment. More recent legislation supports a preventive philosophy, in that chemicals are to be tested before they can be manufactured for commercial use. The evolving toxic control philosophy emphasizes the need to protect total ecological systems and to integrate the regulation of industrial discharges to insure that the requirements for air, water and solid waste discharges are compatible. The responsibility for this coordination currently rests with the Council on Environmental Quality. The problems facing this process include the enormous number of chemicals which need testing, the lack of knowledge of long-term effects of chemicals, and the difficulty of deciding on final disposal sites and methods. SEDIMENT PROBLEMS AND LAKE RESTORATION IN WISCONSIN,
Wisconsin Dept. of Natural Resources, Madison. Office of Inland Lake Renewal.
R. C. Dunst.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-173825, Price codes: A13 in paper copy, A01 in microfiche. In: Management of Bottom Sediments Containing Toxic Substances, Proceedings of the Fifth United States-Japan Experts Meeting, Nov 1979, New Orleans, LA. Environmental Protection Agency Rpt EPA-600/9-80-044, Sep 1980, p 103-113. 4 Fig, 3 Tab, 15 Ref.

Descriptors: *Lilly Lake(WI), *Water quality control, *Lake sediments, Dredging, *Lake restoration, *Sediment control, Sediments, Disposal, *Wisconsin, Lakes, Natural resources, Water resources, Reclamation, Heavy metals, Arsenic.

Concern for the water quality and future well-being of Wisconsin's lakes led to the creation of the Office of Inland Lake Renewal, with the responsibility of protecting and rehabilitating the lakes. Twelve dredging projects are underway or will begin soon, including lakes up to 205 hectares and sediment removal of up to 1,720,250 cubic meters. Solids content of the sediments range from 1-5 to 70-80%. The lack of disposal sites for the sediments has limited project implementation. Arsenic in sediments is a special problem. Organic sediments from Lilly Lake were deposited in an inactive gravel pit and within diked areas on agricultural land. Passage through a spray irrigation system proved impractical because of blockage by fibrous material. Rapid infiltration into the bottom and sides of the setting basins was short-lived due to the sealing characteristics of the sediments. Studies are underway to determine the effect of lake sediment application to upland soil on corn production. (Brambley-SRC)

AN EXPLORATORY APPLICATION OF ENTROPY MINIMAX TO WEATHER PREDICTION: ESTIMATING THE LIKELIHOOD OF MULTI-YEAR DROUGHTS IN CALIFORNIA,
Entropy Ltd., Lincoln, MA.
R. Christensen, R. Eilbert, O. Lindgren, and L. Rans.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-182255, Price codes: A06 in paper copy, A01 in microfiche. Technical Report, Sept. 5, 1980. 105 p, 21 Fig, 13 Tab, 3 Append. OWRT-C-80049-P(No 8409)(1), 14-34-001-8409.

Descriptors: *Forecasting, *Weather forecasting, *Drought, Precipitation, Prediction, *California, *Time series analysis.

A new information theoretic technique was tested for long range forecasting of the probability of extended drought. Time-series data were obtained describing precipitation, stream flow, tree ring indices, atmospheric temperature and pressure, sea surface temperature, Palmer drought severity index, and other variables. The geographical region includes Far Western North America, and mid- and north Pacific Ocean; the time span extends from about 1850 to 1977. These time-series were analyzed for patterns enabling long range prediction of annual precipitation in a 7-station Sacramento-Tahoe region in California. Patterns were found in a randomly selected (training) half of the years enabling prediction of wet versus dry probabilities for the other (test) half with lead times of one, two or three years. The accuracy of the predictions on the test half of the data is 63%, statistically significant at the 94% confidence level. For comparison, the accuracy obtained for a random predictor is 50%, and the accuracy for a one-year persistence hypothesis is 54%, with negligible statistical significance. On extreme years (extremely wet or extremely dry), the predictive accuracy of the patterns rises to 78%, evidence of their physical meaningfulness. On extreme years, the accuracy of the persistence hypothesis, on the other hand, degrades to 51%. (Christensen-EL)

INTEGRATED ASSESSMENT AND MANAGEMENT OF WATER QUANTITY AND WATER QUALITY IN THE MERRIMACK RIVER BASIN, NEW HAMPSHIRE,
New Hampshire Univ., Durham. Inst. of Natural and Environmental Resources.
S. L. Dingman, and B. E. Lindsay.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-182214, Price codes: A07 in paper copy, A01 in microfiche. Water Resource Research Center, University of New Hampshire Research Report No 33, 1981. 116 p, 20 Fig, 7 Tab, 47 Ref, 9 Append. OWRT-A-050-NH(1), 14-34-0001-8031.

Descriptors: Water quantity, *Water quality, *Model studies, *Economic aspects, Water supply, *Available water, Water demand, *Merrimack River Basin, Water resource management, Supply and demand, *New Hampshire, Water resource planning, Water resource problems, Water supply sources.

Sound management of water-resource problems has four major requisites: (1) precise definition of the problem; (2) consideration of all potential alternative solutions; (3) appropriate objectives and criteria for choosing among alternatives; and (4) ability to analyze the alternatives with respect to the choice criteria. This report contributes to these objectives in ways that will be of practical use in water-resource planning in the New Hampshire portion of the Merrimack River Basin and in New England. It does this by separately considering the hydrologic and economic aspects. These two components can be combined into a single framework. The hydrologic analysis examines the nature of supply and demand in the context of water resources. Additionally, a quantitative planning-level framework for identifying the existence and nature of water-resource problems is developed. This framework allows evaluation of the degree to which any proposed management strategy will contribute to the solution of such problems. This model constitutes a simulation model that can accommodate any combination of alternatives, including those that affect demand as well as those that increase supply. The economic aspect of this study emphasizes a mixed-integer multiperiod programming model that utilizes hydrologic and economic data for identifying the discounted least cost of water supply, distribution, and scheduling for three communities. Preliminary sample data were used. This model can identify present water-supply sources that are economically feasible for the future, as well as new reservoirs, based upon projected water demands.

HSPF: A COMPREHENSIVE PACKAGE FOR SIMULATION OF WATERSHED HYDROLOGY AND WATER QUALITY,
Environmental Research Lab., Athens, GA.
T. O. Barnwell, and R. Johanson.
In: Nonpoint Pollution Control – Tools and Techniques for the Future, Proceedings of a Technical Symposium, p 135-153, 1981. 10 Fig, 38 Ref.

Descriptors: *Model studies, *Computer models, *Nonpoint pollution sources, *Forecasting, Estimating, Mathematical models, Rainfall-runoff relationships, Pesticides, Erosion, Land use, Watersheds(Basins), Computer programs, Environmental effects, Soil types.

HSPF, the Hydrologic Simulation Program-Fortran, uses data about rainfall, temperature, solar radiation, land use, soil type, and agricultural practices to simulate the processes that occur in a watershed. Simulation with HSPF produces a time history of the quantity and quality of runoff with predictions of flow rate, sediment load, and nutrients and pesticide concentrations. From this prediction, the model simulates the processes that occur in stream channels in the watershed. HSPF has a data management system so that it can handle large amounts of input data and simulation output. HSPF's ability to simulate the continuous behavior of time-varying physical processes with statistical summaries allows it to be applicable to a wide variety of water resource problems. The model's

software designs include structural programming and top-down design. HSPF incorporates two runoff models, the Agriculture Runoff Management Model and the Nonpoint Source Model. (See also W81-02276) (Seigler-IPA)

A METHODOLOGY FOR ESTIMATING THE LOADS AND IMPACTS OF NONPOINT SOURCES ON LAKE AND STREAM WATER QUALITY,
Center for the Environment and Man, Inc., Hartford, CT.
R. Ahmed, and R. W. Schiller.
In: Nonpoint Pollution Control -- Tools and Techniques for the Future, Proceedings of a Technical Symposium, p 154-162, 1981. 1 Fig, 3 Tab, 19 Ref.

Descriptors: *Model studies, *Nonpoint pollution sources, *Massachusetts, *Connecticut, Urban runoff, Erosion, Planning, Water pollution sources, Runoff forecasting, Surface runoff, Lakes, Lake stages, Phosphorus, Nutrients.

A model for computing loading estimates from nonpoint sources in a watershed (CLENS) was used to quantify the phosphorus in 16 lakes in Connecticut and Massachusetts as part of the development of preliminary management plans. The model is simple and can be used to develop quantitative estimates of nonpoint sources of pollution and their impact on water bodies. It can also be used to develop cost-effective management planning. CLENS is not computer-based although it is amenable to the use of computers. CLENS considers the following nonpoint sources: washoff from urban areas, erosion from other areas, washoff from barnyards and feedlots, leachate from landfills, washoff from roads, leachate from septic systems, and wet and dry fallout. CLENS was recently applied to Lake Waramaug, the second largest lake in Connecticut. Data from this application are given. CLENS has several advantages over a sampling program, it provides long-term estimates and it locates the specific sources and details the primary causes of the pollution. NEW METHODOLOGIES TO EVALUATE BEST MANAGEMENT PRACTICES,
CH2M/Hill, Reston, VA.
F. W. Ellis, R. C. Sutherland, and W. M. Alley.
In: Nonpoint Pollution Control -- Tools and Techniques for the Future, Proceedings of a Technical Symposium, p 163-174, 1981. 8 Fig, 3 Tab, 11 Ref.

Descriptors: *Model studies, *Nonpoint pollution sources, *Urban runoff, *Computer models, Street cleaning, Detention ponds, Sediments, Transport, Best management practices, Particle size distribution, Water pollution, Water pollution sources, Erosion, Estimating, Runoff forecasting.

The Particulate Transport Model (PTM), the Street Cleaning Analysis Model (SCAM), and the Deposition Performance of Sediment in Trap Structures model (DEPOSITS) are new approaches for evaluating the particulate nature of many urban nonpoint source pollutants. They are valuable tools in predicting the effectiveness of Best Management Practices. PTM simulates the buildup of pollutants on urban surfaces, the transport of the sediment portion of the pollutants, and the effectiveness of runoff controls on transport. SCAM simulates the removal of accumulated pollutants by street sweeping. DEPOSITS accounts for the removal of transported particulate pollutants by detention ponds. All three approaches were used to perform a sensitivity analysis on a hypothetical catchment. Simulated were the impacts of catchment slope, initial particle size distribution, street sweeping impacts, and detention basin impacts. (See also W81-02276) (Seigler-IPA)

COST-EFFECTIVENESS FACTORS FOR URBAN BEST MANAGEMENT PRACTICES,
Northern Virginia Planning District Commission, Falls Church.
J. P. Hartigan, D. J. Biggers, H. A. Bonuccelli, and B. E. Wentink.
In: Nonpoint Pollution Control -- Tools and Techniques for the Future, Proceedings of a Technical Symposium, p 199-212, 1981. 2 Fig, 18 Ref.

Descriptors: *Urban runoff, *Model studies, *Nonpoint pollution sources, *Best Management Practices, *Virginia, Urbanization, Occoquan River, Potomac River, Monitoring, Water sampling, Land use, Development, Water pollution, Water pollution sources, *Cost analysis, Water quality.

Continuous simulation studies of urban nonpoint pollution control measures were conducted for the Occoquan River basin, a major tributary of the Potomac estuary. The basin encompasses 580 sq mi and is located in the southern periphery of the Washington, DC, metropolitan area. An intensive monitoring study was used to develop nonpoint pollution loading factors. Twenty-one watersheds with homogeneous land use patterns were monitored for twenty-nine pollutants. The Nonpoint Pollution Sources model was used to derive 'land use-nonpoint pollution' relationships from the monitoring study data base. Using this base, best management practices (BMP) efficiency estimates were made for four categories of controls: source controls, detention basin controls, volume controls, and physical-chemical treatment controls. Results show that multipurpose stormwater management BMP can achieve substantial reductions in pollutants at a lower cost than other control measures such as sweeping and physical-chemical treatment. Multipurpose stormwater management BMP should be capable of minimizing additional deterioration of receiving water quality in urban development areas. (See also W81-02276) (Seigler-IPA)

COMPUTER-MODEL ANALYSIS OF THE USE OF DELAWARE RIVER WATER TO SUPPLEMENT WATER FROM THE POTOMAC-RARITAN-MAGOTHY AQUIFER SYSTEM IN SOUTHERN NEW JERSEY,
Geological Survey, Trenton, NJ. Water Resources Div.
A. W. Harbaugh, J. E. Luzier, and F. Stellerine.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-123259, Price codes: A03 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 80-31, May, 1980. 41 p, 21 Fig, 4 Tab, 20 Ref.

Descriptors: Simulation analysis, Computer models, *Artificial recharge, *Delaware River, *New Jersey, *Model studies, Groundwater resources, Water supply, Aquifers, Forecasting, Potentiometric level, Saline water, Hydrogeology, Hydrographs, Coastal Plain(NJ), Southern New Jersey.

A computer model of the Potomac-Raritan-Magothy aquifer system in southern New Jersey was used to simulate the effects of supplementing groundwater with water from the Delaware River. Replacement of ground water pumpage with surface in a 150-square-mile area near Camden, N.J., was simulated. Artificial recharge of surface water was also simulated in the same area. A series of nine simulations was made. The simulations include the period 1974 to 2000. Two projections for water use were used. Also, in some of the model simulations a line of injection wells was simulated to prevent movement of saline water into pumping centers. The simulations indicate that heads will be as much as 100 feet higher in the year 2000 near the 150-square-mile area than they would be if no surface water had been used. In the model simulations, heads recover upon application of surface water, but start declining again within 2 years. The rate of head decline after surface-water application is slower than before surface-water application. (USGS)
W81-02348

PLANNING REPORT FOR THE SOUTHWEST ALLUVIAL BASINS (EAST) REGIONAL AQUIFER-SYSTEM ANALYSIS, PARTS OF COLORADO, NEW MEXICO, AND TEXAS,
Geological Survey, Albuquerque, NM. Water Resources Div.
D. W. Wilkins, W. B. Scott, and C. A. Kaehler.
Available from the OFSS, USGS Box 25425, Fed. Ctr., Denver, CO 80225, Price: $5.50 in paper copy, $3.50 in microfiche. Geological Survey Open-File Report 80-564, 1980. 39 p, 6 Fig, 75 Ref.

Descriptors: *Project planning, *Aquifer management, *Regional analysis, *Aquifer systems, *Alluvial aquifers, Aquifer characteristics, Model studies, Flow system, Geochemistry, Hydrogeology, Water utilization, Surface-groundwater relationships, Water quality, Data collections, Colorado, New Mexico, Texas, *Rio Grande, Regional Aquifer System Analysis program.

The study of the Southwest alluvial basins (east) will involve an analysis of the regional aquifer system in parts of Colorado, New Mexico, and Texas. This area has been divided into 22 basins. The study of the alluvial aquifer-system will be made in the following stages: (1) project planning, (2) literature searches, (3) compiling existing data, (4) data collection, (5) basin modeling, (6) regional aquifer modeling, and (7) reports. The regional aquifer study will be accomplished through studying each of the 22 basins. Data compilation and limited data collection will be part of each basin study. Digital computer models will be made for those basins where data are sufficient. A regional aquifer model will be developed from the basin models. In addition to this report, there will be basin hydrology reports and the final regional report. Included in the final report will be a description of the regional hydrology and geology. (USGS)

6B. Evaluation Process

ENGINEERING PLANNING AND EVALUATION OF POTENTIAL RESERVOIR SITES.
Arkansas Univ., Fayetteville. Coll. of Engineering.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-175960, Price codes: A06 in paper copy, A01 in microfiche. 1980. 116 p, 5 Fig, 3 Tab, 17 Ref. OWRT-A-999-ARK(3).

Descriptors: *Arkansas, *Engineers estimates, *Sites, *Planning, *Reservoir sites, Evaluation, Surface waters, Topography, Geology, Impoundments, Streamflow, Water table, Drainage, Damsites, Surveys.

Potential reservoir sites in Arkansas were investigated based on hydrology, geology, and other engineering factors. The investigation was designed to identify sites where water may be impounded most effectively and economically to help insure adequate quantity for state, municipal, industrial and agricultural uses, plus export to other areas where water is scarce. Potential sites were selected based on terrain, streamflow, geological characteristics, storage requirements and present usage of the area to be inundated. In order of quantity of water availability, the most feasible undeveloped surfacewater was found in the basins of the White, Arkansas, Ouachita and Red Rivers. These have a combined total drainage area of 7,616 square miles, with a mean annual flow of 5,678,674 acre feet and a maximum volume of 9,539,783 acre feet. (Garrison-Omniplan)

EVALUATION AND REVISION OF SEDIMENT AND EROSION CONTROL PROGRAMS IN URBANIZING AREAS FOR NONPOINT SOURCE MANAGEMENT,
Regional Planning Council, Baltimore, MD.

S. R. Martin, and J. M. Helm.
In: Nonpoint Pollution Control -- Tools and Techniques for the Future, Proceedings of a Technical Symposium, p 175-187, 1981. 1 Fig, 2 Tab, 19 Ref.

Descriptors: *Maryland, *Nonpoint pollution sources, *Pollution control, *Programs, *Evaluation, Performance, Erosion, Sedimentation, Regulations, Water pollution, Water pollution sources, Monitoring, Management, Optimization, Systems analysis, Urbanization, Urban runoff.

The Baltimore Regional Planning Council has reviewed Maryland's sediment control laws and has recommended program redesign strategies to modify existing programs to meet nonpoint source guidelines and to optimize program effectiveness. Evaluation results are grouped under major categories including: legal authority; policies and procedures; education and public participation; guidelines, standards, and specifications; plan preparation; plan review; program monitoring; and general findings. Evaluation results show that an evaluation team composed of sediment and erosion control pro fessionals, elected officials, and citizens is realistic and effective. Federal 208 regulations were found to be generally applicable and reasonable, however, regulations do not allow sufficient time for proper design. Some officials in local jurisdictions were reluctant to publicize findings and recommendations. Periodic, intensive evaluations and modifications of programs for nonpoint source control must become part of program operations to optimize effectiveness. (See also W81-02276) (Seigler-IPA)

SELECTION OF POTENTIALLY CRITICAL AREAS FOR AGRICULTURAL LIVESTOCK WASTE IN MARYLAND,
Cooperative Extension Service, Centerville, MD.
H. L. Brodie, M. L. Rodevick, and R. J. Adkins.
In: Nonpoint Pollution Control -- Tools and Techniques for the Future, Proceedings of a Technical Symposium, p 252-258, 1981. 2 Fig, 1 Tab, 4 Ref.

Descriptors: *Maryland, *Nonpoint pollution sources, *Agricultural runoff, *Manure, *Farm wastes, Animal wastes(Wildlife), Livestock, Cattle, Domestic animals, Feed lots, Poultry, Horses, Sheep, Water pollution sources, Ranking, Economic evaluation.

Watersheds in Maryland were ranked for potential nonpoint pollution impact based on livestock and poultry manure production. Manure production was based on average population inventory on any one given date. Annual production was used to indicate housing capacity when more than one group of animals was produced annually. Population data were refined by dividing poultry into broilers and chickens, and cattle into dairy, beef, and other cattle. Swine were divided into breeding and feeding swine. Assumed annual wet manure product in pounds per animal per year was: dairy cows, 36,000; beef cows, 23,000; other cattle, 15,500; breeding swine, 3,407; feeding swine, 2,227; broilers, 51; chickens, 77; horses, 16,425; and sheep, 1,460. Land use areas were delineated using computerized data from Maryland's geographic information system. Bacterial impact and severity factors were considered and a severity index was developed. Watersheds were ranked by the Animal Waste Factor = Bacterial Severity X Bacterial Impact X Manure Equivalent Density per Acre of Cropland and Pastureland within the watersheed. (See also W81-02276) (Seigler-IPA)

NONPOINT POLLUTION: FUTURE ECONOMIC AND FINANCIAL ISSUES,
Virginia Water Resources Research Center, Blacksburg.
W. R. Kerns.
In: Nonpoint Pollution Control -- Tools and Techniques for the Future, Proceedings of a Technical Symposium, p 267-273, 1981. 10 Ref.

Descriptors: *Nonpoint pollution sources, *Control programs, *Cost-benefit analysis, *Economic analysis, Incentives, Regulation, Voluntary actions, Penalties, *Water pollution control, Water pollution sources, Management, Agencies, Funding, Alternative costs, Cost sharing.

Due to the extreme expense of a nonpoint pollution program based on the traditional regulation and control techniques, alternatives, and trade-offs must be considered in the development and implementation of a control program. Tools and techniques are being developed to determine the socially desirable level of pollution and what trade-offs are needed. Innovative incentive programs are needed to combat nonpoint pollution since those who bear the major costs of control are not the ones who enjoy the major benefit. An implementation program for controlling nonpoint pollution must consider the best way to change the behavior of land users, by regulation, incentives, penalties, or voluntary action. Approaches other than regulation and control are more effective and acceptable. Financial aspects must be considered and priorities for funding must be established. All alternatives for nonpoint pollution control programs must be carefully analyzed in order to obtain desired levels of water quality at a reasonable cost to everyone. (See also W81-02276) (Seigler-IPA)
W81-02305

ECONOMETRIC AND PROGRAMMING TOOLS FOR EVALUATION OF THE ECONOMIC IMPACTS OF NONPOINT POLLUTION,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Agricultural Economics.
K. H. Baum, D. Seal, and W. R. Kerns.
In: Nonpoint Pollution Control--Tools and Techniques for the Future, Proceedings of a Technical Symposium, p 274-284, 1981. 1 Fig, 1 Tab, 20 Ref.

Descriptors: *Nonpoint pollution sources, *Computer models, *Model studies, *Economic impact, Best management practices, Linear programming, Dynamic programming, Recursive programming, Environmental effects, Computer programs, Simulation analysis, Numerical analysis, Water pollution.

Methodological procedures for modeling economic and environmental impacts resulting from the implementation of Best Management Practices to control nonpoint pollution are discussed. The methodologies considered are: linear programming, dynamic programming, econometric and simulation techniques, and recursive interactive or adaptive programming. Each procedure offers environmental modeling advantages, but each is also limited in the types of analyses which may need to be performed. Linear programming requires detailed crop and livestock budgets, technical input-output coefficients, and the relevant constraints system. Dynamic programming includes time within the modeling format and implicitly assumes a simultaneous feedback mechanism. Recursive programming models are in the general class of dynamic models where planning is determined by a single optimizing decision. Recursive interactive or adaptive programming models are superior due to their dynamic capability to investigate the normative and positive policy questions involved in environmental management, and due to their compatibility with other computer programs. DREDGING ON A COMPETITIVE BASIS,
Corps of Engineers, Fort Belvoir, VA. Dredging Div.
W. R. Murden, Jr.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-173825, Price codes: A13 in paper copy, A01 in microfiche.
In: Management of Bottom Sediments Containing Toxic Substances, Proceedings of the Fifth United States-Japan Experts Meeting, November, 1979, New Orleans, Louisiana. Environmental Protection Agency Report EPA-600/9-80-044, September, 1980, p 1-17.

Descriptors: *Dredging, *Sediments, *Channel improvement, Investment, Legislation, Unit costs, Equipment, Federal project policy, Dredges, Sediment control, Harbors, River beds, River training, *Costs, Bids, *Dredging equipment, Economics.

A rapid and significant decrease in workload and the relatively constant unit costs from 1963 to 1978 caused reluctance to invest in new equipment by the dredging industry and a reassessment of dredging equipment needs by the Corps of Engineers. The Industry Capability Program, which provides an opportunity for industry dredges to compete with Corps dredges, was implemented to encourage the industry to invest in new equipment, particularly seagoing hopper dredges. The background to the enactment of Public Law 95-269 in 1978 is presented. The law requires that the Corps of Engineers determine the minimum Corps fleet of dredges required to perform emergency and national defense work; that industry dredges be used only when Corps dredges are not available and within specific cost limits; and that the Corps retain a modern minimum fleet for emergency and defense purposes and sufficient other equipment to allow it and industry to carry out projects for improvements of rivers and harbors. The minimum Corps dredge fleet should be one large, four medium and three small class hopper dredges while the existing and planned industry dredge fleet consists of two large, six medium, and three small class hopper dredges. (Brambley-SRC)

STAFF REVIEW OF PROPOSED LOCK HAVEN FLOOD PROTECTION PROJECT.
Susquehanna River Basin Commission, Harrisburg, PA. Planning and Operations Div.
Publication No 71, November, 1980. 21 p, 1 Tab, 2 Maps.

Descriptors: *Pennsylvania, *Flood protection, *Civil engineering, *Dams, *Regional flood, Flood plains, Flood damage, Flood control, Diversion, Multi-purpose projects, Water resources development, Regional development, River regulation, Abatement, Hydraulic structures, *Lock Haven.

Since 1847 when recording of flood information was initiated, the city of Lock Haven, PA, has been flooded nineteen times with major floods occurring in 1889, 1936, 1946, 1950 and 1972. This review of the U.S. Corps of Engineers' proposed Lock Haven Flood Protection Project identifies relevant issues including a history of proposed regional flood control measures, consideration of alternatives to the project, project impact, upstream-downstream concerns, economic factors, and public response. The staff recommends that the project be included in the Susquehanna River Basin Commission's Comprehensive Plan for funding and construction, but suggests there be continuing consideration of a regional solution to flood control rather than a piecemeal approach. They also recommend that the Corps' final report acknowledge the remaining widespread vulnerability of communities along the West Branch of the Susquehanna River to flood damage after the Lock Haven project is completed. To determine flood impacts, an elevation-damage relationship was obtained with stage-damage relationship updated to 1980. Total existing average annual flood damages throughout the project area are estimated to be approximately $4.54 million. However, the staff report stresses that once the Lock Haven project is in place, future opportunity to develop upstream structures may be precluded. (Garrison-Omniplan)

6C. Cost Allocation, Cost Sharing, Pricing/Repayment

BENEFIT TAXATION AND COST SHARING: MECHANISMS FOR ENCOURGAGING ACCEPTANCE OF NONPOINT POLLUTION CONTROL STRATEGIES,
Tennessee Univ., Knoxville. Dept. of Agricultural Economics and Rural Sociology.
W. Park, and L. Shabman.
In: Nonpoint Pollution Control--Tools and Techniques for the Future, Proceedings of a Technical Symposium, p 285-293, 1981. 2 Tab, 4 Ref.

Descriptors: *Virginia, *Cost sharing, *Nonpoint pollution sources, *Best management practices, Land use, *Cost-benefit analysis, Cost-benefit ratio, Economics, Economic analysis, Water pollution sources, Water pollution, Urban runoff, Agricultural runoff.

Economic incentives and compensations are being considered in the Occoquan River basin to solve the problem of the economic inequity of nonpoint pollution control programs. With nonpoint pollution controls, the area bearing the most cost of control is not the area receiving the most benefit from the control. The Occoquan River basin encompasses parts of four counties in northern Virginia. Fauquier County with 70,592 acres of the area's agricultural land stands to gain only 1 to 3% of the water quality benefits from the implementation of Best Management Practices. Fairfax County, with only 6,775 acres of agricultural land, will gain 40 to 67% of the improved water quality benefits. Two scenarios, OPTIMISTIC and PESSIMISTIC can be applied to determine cost sharing predictions needed to make nonpoint pollution controls fair and acceptable to all counties. One appropriate mechanism for raising cost sharing funds would be a fee for recreational fishing. (See also W81-02276) (Seigler-IPA)

THE UNITED NATIONS INTERNATIONAL DRINKING WATER SUPPLY AND SANITATION DECADE,
United Nations Educational Scientific and Cultural Organization, Paris (France). United Nations Development Programme.
P. G. Bourne.
Aqua, Vol 8, p 17-20, 1980.

Descriptors: *United Nations, *Potable water, *International Drinking Water Supply and Sanitation Decade, *Environmental sanitation, *Water supply development, Public health, Resources, Water resources development, Human diseases, Diseases, Water policy, Project planning, Planning, Water users, Costs, Estimated costs.

The Decade, formally launched at a Special Session of the United Nations General Assembly, Nov. 10, 1980, was established to provide clean drinking water and sanitation for all by 1990. Achievement of this goal would cut infant mortality in half and revolutionize the role of women in rural areas. At the international level the U.N. provides the overall framework, the technical support, the momentum, and the publicity for this project. Agencies involved are the World Health Organization, World Bank, UNICEF, Food and Agriculture Organization, International Labor Organization, and UNESCO. A steering committee composed of representatives from these groups meets every 3 months. The U.N. Development Program is responsible for collecting and distributing funds. At the national level the Development Program resident representative coordinates all the project's activities within this nation, stimulates the government in the aims of the Decade, provides technical assistance, and works with the diplomatic community. On the local level a total of half a million skilled persons are needed--from PhD hydrologist to pump repairman. Technical training, health education, and community involvement are important goals. A global cost of 20 to 100 billion dollars has been estimated. (Cassar-FRC)

DEVELOPMENTS IN EEC WATER POLICY,
Thames Polytechnic, London (England).
R. C. Denney.
Water Services, Vol 84, No 1015, p S23-S24, September, 1980. 22 Ref.

Descriptors: *Water policy, *Governments, *Regulation, Law enforcement, Water permits, EEC water policy, Future planning, *Europe.

Changes in the EEC water policy during the past two years are reviewed. Increasing concern demonstrated by the European Parliament has had far-reaching effects on EEC water policy. Steps are now underway to determine which member states are not complying with various environmental directives, such as those concerned with the quality of bathing water. Many of the EEC programs are long-term. EEC legislation which is under consideration aims at harmonizing pollution control throughout member states so that no single state will gain an industrial or exporting cost advantage due to inadequate environmental controls. EEC legislation on prevention of water pollution is becoming increasingly more stringent. Legislation is now under consideration, aimed at protecting groundwaters from pollution. Legislation is expected to be passed concerning water pollution by certain industries. (Baker-FRC)

WATER QUALITY MANAGEMENT PLANNING: THE STATE PERSPECTIVE,
Association of State and Interstate Water Pollution Control Administrators, Washington, DC.
R. J. Savage.
In: Nonpoint Pollution Control -- Tools and Techniques for the Future, Proceedings of a Technical Symposium, p 17-21, 1981.

Descriptors: *Water quality management, *Federal government, *State governments, *Local governments, *Nonpoint pollution sources, Water pollution sources, Administration, Planning, Government finance, Governmental interrelations, Legislation, Management, Federal Water Pollution Control Act.

From the viewpoint of the States, it appears that all too often Federal water pollution programs have been a 'revolving carousel of priorities' and management changes rather than reasoned, deliberate, and consistent programs with well defined management and an adequate stable flow of funds. The role of State officials in water quality management is often unclear with Governors being given assignments but little or no implemention authority. Section 208 of the Federal Water Pollution Control Act of 1972 has been an issue since its passage. It took the Environmental Protection Agency (EPA) more than a year and a half after passage to develop program regulation for Section 208 implementation. EPA focused initial efforts on the construction of waste water treatment facilities, which pushed construction ahead of planning. After much conflict and internal trouble, the 208 plan is moving ahead. States and Locals are paying more attention to nonpoint sources and best management practices are being introduced. Several states such as North Carolina, South Carolina, Utah, and Illinois have begun planning programs. Cooperation between officials at all levels is needed to give a possibility of success to water quality programs. (See also W81-02276) (Seigler-IPA)

ENVIRONMENTAL LEGISLATION AND NONPOINT POLLUTION: THE PENNSYLVANIA EXPERIENCE,
Pennsylvania Joint Legislative Air and Water Pollution Control and Conservation Committee, Harrisburg.
L. J. Schweiger.
In: Nonpoint Pollution Control -- Tools and Techniques for the Future, Proceedings of a Technical Symposium, p 22-25, 1981.

Descriptors: *Nonpoint pollution sources, *Pennsylvania, *Water pollution control, *Legislation, Coals, Strip mine wastes, Mine drainage, Coal mine wastes, Acidic water, Urban runoff, Erosion, Regulation, Water law, Water resources development.

After 20 years of significant accomplishments in pollution control and conservation, Pennsylvania will take care in the 1980's to preserve their progress in the face of concerns about energy. A series of legislative actions in the 1960's and 1970's dealt with such areas as solid waste management, air pollution, water pollution, mines and industries, scenic rivers, pesticides, wild resources, and endangered plants. Nonpoint pollution remains Pennsylvania's single largest and most widespread water pollution problem. Approximately 90% of all seriously polluted streams in the State are affected by mine drainage from abandoned mines. The State itself is estimated to have 40% of the entire nation's abandoned mine scars. Despite current laws, erosion from active strip mining is also a problem. Agricultural and urban runoff contribute to the nonpoint source problem. The 1980's will be a difficult period and regulations must be scrutinized to weed out unnecessary requirements. Regulations of the future must be flexible and in proportion to the problem they attempt to solve. (See also 81-02276) (Seigler-IPA)

DISTRIBUTION AND CONCENTRATION OF PCB IN THE HUDSON RIVER AND ASSOCIATED MANAGEMENT PROBLEMS,
New York State Dept. of Environmental Conservation, Albany. Bureau of Water Research.
I. G. Carcich, and T. J. Tofflemire.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-173825, Price codes: A13 in paper copy, A01 in microfiche.
In: Management of Bottom Sediments Containing Toxic Substances, Proceedings of the Fifth United States-Japan Experts Meeting, Nov. 1979, New Orleans, LA. Environmental Protection Agency Rpt EPA-600/9-80-044, Sep. 1980, p61-86. 6 Fig, 8 Tab, 15 Ref.

Descriptors: *Polychlorinated biphenyls, *Hudson River, *Water quality control, *River beds, *Sediments, Water pollution sources, Toxicity, Economic impact, Dredging, Water pollution, Soil contamination, Pollutants, Sediment control, Environmental effects.

The Hudson River is contaminated with an estimated 640,000 lb of PCB's and a remedial program has been formulated by New York State to cope with this toxic pollutant. Over $3 million has been spent to fully document the extent of PCB contamination in the Upper Hudson River. Over 60% of the PCB's seem to be contained in 40 'hot spot' areas, which have PCB concentrations of over 50 ppm. After evaluating all the decontamination choices, the PCB Reclamation Project was formulated which consists of mechanically or hydraulically dredging the 40 'hot spots' and placing the sediments in an uncapsulated land burial facility. The short and long term environmental impacts are presented for the various decontamination choices. New York is seeking to finance this remedial project through the use of Federal funds, that could be obtained through the Clean Water Act or through special Congressional legislation or through the Superfund Bill, once it is enacted. The PCB Reclamation Project, if funded this spring as is presently anticipated, could be completed by 1982. (Brambley-SRC)

THE SECTION 404 DREDGE AND FILL PROGRAM,
Environmental Protection Agency, Washington, DC.
J. P. Crowder.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-173825, Price codes; A13 in paper copy, A01 in microfiche.
In: Management of Bottom Sediments Containing Toxic Substances, Proceedings of the Fifth United States-Japan Experts Meeting, Nov. 1979, New Orleans, LA. Environmental Protection Agency Report EPA-600/9-80-044, Sep. 1980, p 87-101. 1 Tab, 6 Ref.

Descriptors: *Water pollution control, *Dredging, *Legislation, *Water quality control, *Navigable waters, Water policy, Recreation, Industrial water, Fisheries, Agriculture, Federal jurisdiction, Disposal, Environmental effects, Testing.

In 1975 the jurisdiction of Section 404 of the Federal Water Pollution Control Act of 1972 was extended to cover all waters subject to use for navigation; recreational use; production of fish and shellfish; production of agricultural products; industrial water supply; or for any other purpose which involves the use of the waters for interstate or foreign commerce purposes. Dredge and fill operations in some waters are subject to section 10 of the 1899 Rivers and Harbors Act supervised by the Army Corps of Engineers, who share supervisory responsiblity for section 404 with the EPA. Section 404 states that consideration must be given to the need for the proposed discharge and the availability of alternative sites and methods of disposal that are less damaging to the environment. Chemical and/or bilogical testing of material proposed for discharge may be required in order to assess the impact of disposal. (Brambley-SRC)

TECHNIQUE FOR ESTIMATING THE MAGNITUDE AND FREQUENCY OF FLOODS IN THE HOUSTON, TEXAS, METROPOLITAN AREA,
Geological Survey, Houston, TX. Water Resources Div.
F. Liscum, and B. C. Massey.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A089 495, Price codes: A03 in paper copy, A01 in microfiche.
Geological Survey Water-Resources Investigations 80-17, April, 1980. 29 p, 2 Fig, 11 Tab, 11 Ref.

Descriptors: *Flood forecasting, *Peak discharge, *Urbanization, *Model studies, Texas, *Urban runoff, Rainfall, Streams, Flow, Flood frequency, Flood recurrence interval, Flood peak, Regression analysis, Estimating, Annual peak discharge, Flood plains, Flood plain insurance, *Houston(TX).

A technique for estimating the magnitude and frequency of floods in the Houston, Tex., metropolitan area was developed by use of a multiple-regression flood-frequency analysis of flow data from unregulated streams in the area. A digital model, relating flood-peak discharge to concurrent rainfall and antecedent soil moisture conditions, was used to simulate 67-year records of annual peak discharges. Flood-frequency characteristics were determined for the simulated annual peaks and for the observed annual peaks at each of 22 gaging-station sites. Relationships applicable to unregulated streams were developed for predicting floods with recurrence intervals of 2, 5, 10, 25, 50, 100, and 500 years. The relationships indicate that as a basin changes from a completely natural state to one of complete urbanization, the magnitude of a 2-year peak discharge is increased by a factor of 4.2, the magnitude of a 50-year peak is increased by a factor of 4.9, and the magnitude of a 100-year peak is increased by a factor of 4.9. PROPOSED TRINITY RIVER BASIN FISH AND WILDLIFE MANAGEMENT PROGRAM, SUMMARY REPORT, FINAL.
Frederiksen, Kamine and Associates, Inc., Sacramento, CA.
Report prepared for Water and Power Resources Service, October, 1980. 89 p, 16 Fig, 6 Tab. 8-07-02-V0035.

Descriptors: *Wildlife management, *Fish management, *Watershed management, *River basin development, California, Land use, Habitat improvement, Chinook salmon, Coho salmon, Steelhead trout, Commercial fishing, Sport fishing, Deer, Road construction, Lumbering, Aquatic habitats, Discharge(Water), Marine fisheries, *Trinity River Basin.

Since completion of the Trinity River Division of the Central Valley Project in California in 1963, salmon and steelhead trout have declined in the river, and physical changes have occurred in the river. The major factors which caused the declines in anadromous fish are: habitat deterioration because of the combined effects of the Trinity Project, logging and associated road building, construction, and elimination of major flood events; overfishing because of the combined catch by ocean and instream fishing; hatchery inefficiencies; and complexities of fishery management. Deterioration of wildlife habitat is attributed to land use, and deer management practices. Restoration and management of king salmon, silver salmon, steelhead trout, and black-tailed deer can be accomplished. Specific production goals and fish harvest regulations that provide for adequate spawning escapement need to be established. Present minimum releases from Lewiston Reservoir are inadequate even if sediment yeilds are reduced. A comprehensive watershed rehabilitation program is required if instream habitat is to be improved. Habitat manipulation for wildlife management should include consideration of both nongame and game species. Based on the findings, a comprehensive management program was formulated, consisting of 14 program actions, none of which can be considered optional or discretionary. (Moore-SRC)
W81-02328

PROPOSED TRINITY RIVER BASIN FISH AND WILDLIFE MANAGEMENT PROGRAM, MAIN REPORT, FINAL.
Frederiksen, Kamine and Associates, Sacramento, CA.
Report prepared for Water and Power Resources Service, October, 1980. 336 p, 61 Fig, 21 Tab. 8-07-02-V0035.

Descriptors: *Fish management, *Wildlife management, *River flow, *Watersheds, *River basin development, *California, Land use, Environmental effects, Diversion, Chinook salmon, Coho salmon, Steelhead trout, Habitat improvement, Commercial fishing, Sport fishing, Lumbering, Road construction, Construction, Sediments, Fish hatcheries, Deer, *Trinity River Basin.

The management program is to constitute the guide for actions to restore the population of salmon and steelhead from the river, and wildlife of the basin and ultimately through proper management to maintain these at an adopted level. The problems confronting the fish resource consist of: habitat deterioration because of the combined effects of the diversion of 90% of the water originating above Lewiston Dam, logging and associated road building, construction and elimination of major flood events; overfishing because of the combined catch by commercial, sport, and Indian fishing; complexities of management; and hatchery inefficiencies because of inadequate facilities and lack of good biological data. The problem for deer consist of: habitat deterioration because of suppression of wildfires, water impoundments, building, and road construction; and inadequate management. A program to provide for the restoration and long-range management of the fish and wildlife resources of the basin is proposed, consisting of the following 14 actions: establish institutional organization; regulate catch; rehabilitate and maintain tributaries in the upper Trinity River; rehabilitate watersheds; rehabilitate Grass Valley Creek Watershed; set criteria for roads and general construction; remove river sand and modify channel; monitor fishery and operations; monitor stream conditions; restrict floodplain development; monitor land use; manage fish production; formulate a comprehensive wildlife management program; and conduct wildlife habitat manipulation program. (Moore-SRC)
W81-02329

PROPOSED TRINITY RIVER BASIN FISH AND WILDLIFE MANAGEMENT PROGRAM, APPENDIX A, SOCIOECONOMIC ANALYSIS, FINAL.
Frederiksen, Kamine and Associates, Sacramento, CA.
Report prepared for Water and Power Resources Service, October, 1980. 156 p, 8 Fig, 35 Tab, 39 Ref. 8-07-02-V0035.

Descriptors: *Economic impact, *Social impact, *Fish management, *Wildlife management, *California, *River basin development, Land use, Indian reservation, Lumbering, Agriculture, Irrigation, Commercial fishing, Sport fishing, Discharge(Water), Water resources, *Trinity River Basin.

A demographic profile is presented for Trinity County and a portion of Humboldt County, California, which are located in the Trinity River Basin. The lumber industry is the main industry in

Trinity County, but it is being hurt by the limited amount of forestlands available. Recreation related tourism is another mainstay of the economy, but it has been depressed for the past several years. The primary economic problem is unemployment, which is particularly severe during the winter months because the lumber industry and recreation are seasonal. Forestlands constitute the predominant land use, with more than 90% of the land in forests. Other major land uses are: recreation, agriculture, housing, mining, and roads. As part of the fish and wildlife management program proposed for the Trinity River Basin, minimum flow release schedules for the Trinity River Project may be modified, and modification will affect the Central Valley Project. The relative value of economic trade-offs that will result from increasing water releases to the Trinity River was estimated for the irrigation, power and energy, and fisheries sectors. The economic impact to the agriculture sector and the power sector will be negative for increases in releases to the river. The sports and commercial fishery instream and in the ocean should benefit from increases in water releases. The Indian subsistence fishery has cultural values beyond simply the food value, and thus it is difficult to assign an economic value to it. (Moore-SRC)
W81-02330

PROPOSED TRINITY RIVER BASIN FISH AND WILDLIFE MANAGEMENT PROGRAM, APPENDIX B, SEDIMENT AND RELATED ANALYSIS, FINAL.
Frederiksen, Kamine and Associates, Sacramento, CA.
Report prepared for Water and Power Resources Service, October, 1980. 345 p, 45 Fig, 56 Tab, 8-07-02-V0035.

Descriptors: *Aquatic habitat, *Sediment yield, *River basin development, *California, Anadromous fish, *Sediment control, Hydrology, Sedimentation rates, River flow, Watershed management, Environmental effects, *Trinity River Basin.

The flow characteristics of the Trinity River in California has been affected by the Trinity River Project which was made operational in 1963. Since then, approximately 90% of the average annual runoff upstream of Lewiston has been diverted out of the Trinity River Basin. Pre-project and post-project hydrological changes, overall visual changes in river regime, sediment sources and yields, and components of the river regime considered to be most important to anadromous fish habitat were evaluated. The present flow conditions at Lewiston and the present excessive subbasin sediment yields have negatively impacted some aspects of the anadromous fish habitat, and the negative impacts will continue. The greatly reduced mean annual water discharges and the large volume of sediment entering the Trinity River system have degraded the usefulness of many pool and riffle areas. Any remedial actions must include extensive watershed management to reduce the amount of sediment entering the river. With the reduction of present sediment yields, maintenance of pool areas would be possible through either one or a combination of Lewiston flushing releases and debris dams on major sediment producing tributaries. Under present flow conditions, the occurrence of flows with sufficient magnitude to initate riffle bed movement has been elimiated from Lewiston Dam to Grass Valley Creek, and the frequency of such flows has been drastically reduced to the North Fork. (Moore-SRC)
W81-02331

PROPOSED TRINITY RIVER BASIN FISH AND WILDLIFE MANAGEMENT PROGRAM, APPENDIX C, FISH AND WILDLIFE ANALYSIS, FINAL, VOLUME 1.
Frederiksen, Kamine and Associates, Sacramento, CA.
Report prepared for Water and Power Resources Service, October, 1980. 389 p, 53 Fig, 65 Tab. 8-07-02-V0035.

Descriptors: *Fish management, *Anadromous fish, *Aquatic habitat, River flow, *California, Chinook salmon, Coho salmon, Steelhead trout, Environmental effects, Fish populations, Habitat improvement, Diversion, Sediments, River basin development, Fish hatcheries, Commercial fishing, Sport fishing, Land use, *Trinity River Basin.

As part of an effort to define and correct the fish resource declines in the Trinity River Basin, California, attributable to the Trinity River Division, Central Valley Project and to other causes, fish resources within the basin are examined and changes that have occurred over time are identified. The anadromous fish of principal interest include the king salmon, silver salmon, and steelhead trout. Major factors which are found to affect fish populations include: both sport and commercial fishing in the ocean; sport fishing and Indian fishing instream, habitat deterioration since construction of the Trinity River Project; land use changes; predation; fish culture and hatchery operations. The main items affecting the fish habitat in the upper Trinity River include: closure of the river at Lewiston, changed flow regime, changed temperature regime, continual or increased sediment production, changed channel configuration, and changed substrate. The effects of alternative flow release schedules on trout and salmon habitat are evaluated in terms of costs and benefits. The recommended management option for fish production consists of 50% artifical production below Lewston Dam, a total annual release of about 260,000 acre-feet of water, and allowable harvest of 11,900 king salmon in spring, 148,000 to 155,000 in fall, 10,100 silver salmon, 32,500 adult steelhead, and 30,000 half-pounders. Modifications in fish culture technology and hatchery facilities are recommended, including timing and size of release, construction of release ponds, diet, and hatchery environment. (Moore-SRC)
W81-02332

PROPOSED TRINITY RIVER BASIN FISH AND WILDLIFE MANGEMENT PROGRAM, APPENDIX C, FISH AND WILDLIFE ANALYSIS, FINAL, VOLUME 2.
Frederiksen, Kamine and Associates, Sacramento, CA.
Report prepared for Water and Power Resources Service, October, 1980. 358 p, 11 Fig, 39 Tab, 530 Ref., est. 8-07-02-V0035.

Descriptors: *Invertebrates, *Wildlife, *Fish management, *Aquatic populations, Fish food organisms, *California, Benthos, Aquatic habitat, Wildlife management, Habitat improvement, Silting, Low flow, River flow, Streambeds, Bottom sediments, *Trinity River Basin.

The Trinity River flow regime was significantly altered by the construction of Lewiston and Trinity Dams and since their construction the river has been subjected to heavy siltation. Changing flows and siltation can adversely affect aquatic invertebrate populations and subsequent fish production. A comparative study of the benthic organisms of the Trinity River System and the Smith River was carried out using a Surber sampler and a screen sampler, and fish stomach contents were analyzed. The Smith and Trinity systems are comparable in benthic population type and density, and similar in bottom structure, sand, gravel and boulder size. The variability in benthic population density from the lower Trinity and Smith Rivers to the upper Trinity seems to be due to altitudinal differences. The benthic fauna production capability of the Trinity River systems is good when compared with the Smith River and North Fork, which have not been as adversely impacted by diversions and siltation. Increased benthic populations in the Trinity River above the North Fork should be very responsive to the cleansing of the substrate. Wildlife problems in the Trinity River Basin appear to be associated with both habitat deficiencies and policy matters. The habitat problems stem from the loss of land resulting from the inundation of more than 20,000 acres to create the reservoirs. A comprehensive wildlife management program including a habitat manipulation and management plan, should be developed and implemented for the entire Trinity River basin. (Moore-SRC)

PROPOSED TRINITY RIVER BASIN FISH AND WILDLIFE MANAGEMENT PROGRAM, APPENDIX D, DRAFT REPORT COMMENTS AND RESPONSES, FINAL, VOLUME 1.
Frederiksen, Kamine and Associates, Sacramento, CA.
Report prepared for Water and Power Resources Service, October, 1980. 559 p. 8-07-02-V0035.

Descriptors: *Fish management, *Wildlife management, *Habitat improvement, *Water resources, *California, Aquatic habitat, Land management, Instream flows, *Trinity River Basin, Economics, River flows, Diversion.

The comments of the Trinity River Basin Fish and Wildlife Task Force on the Draft Report on the Proposed Trinity River Basin Fish and Wildlife Management Program and the responses by the contractor are presented. The Task Force consists of the following agencies which have land or natural resources management responsibilities in the Trinity River Basin in California: Water and Power Resources Service; Fish and Wildlife Service; Bureau of Land Management; Bureau of Indian Affairs; Soil Conservation Service; Forest Service; National Marine Fisheries Service; Department of Water Resources; California Department of Fish and Game; State Water Resources Control Board; Trinity County; Humboldt County; Hoopa Valley Tribe. Major points of disagreement include the following: recommended instream flows; organizational structure; fishery problems; construction of a debris dam on Grass Valley Creek; logging practices; the study of wildlife problems; and the economic values for water diverted to the Central Valley, and for fish. (Moore-SRC)

Toxic Substances, Proceedings of the Fifth United States-Japan Experts Meeting, Nov., 1979, New Orleans, LA. EPA Report EPA-600/9-80-044, Sep., 1980, p 259-272. 2 Fig, 2 Tab, 17 Ref. R805885010.

Descriptors: *Sediments, *Sampling, *Analytical techniques, *Testing procedures, Water quality standards, Water quality control, Dredging, Preservation, Hydrology, Water resources, Decision making, Regulation, Sediment control.

Increasing regulatory concern over the effects of sediments on water quality will require expanded sediment sampling, and standardized methods of sediment collection, sample handling and analysis to insure comparability of data. This paper presents a procedure based on an awareness of the interrelated nature of the decisions to be made. The first step in the approach is an explicit statement of the purpose of the study so that testing procedures can be selected that are the most efficient and simplify the selection of sample handling and storage requirements. Selection of sample collection techniques and locations is the most difficult area to provide definitive guidance because of the importance of point sources, local hydrology, study purposes, and financial resources. Bias that can be introduced as a result of collection and location decisions is discussed. By being aware of the present limitations of available sampling techniques and analytical procedures, project managers can define the best sampling program for their specific need. (Brambley-SRC)

RESISTANCE OF NUTRIENT CYCLING SYSTEMS TO PERTURBATIONS OF THE FLOW RATES,
Georgia Univ., Athens. Dept. of Mathematics.
G. W. Harrison, and S. Fekete.
Ecological Modelling, Vol 10, p 227-241, August, 1980. 4 Fig, 1 Tab, 12 Ref.

Descriptors: *Flow rates, *Nutrients, Equilibrium, Model studies, Mathematical models, Pollutants, *Ecosystems.

A linear model is used to measure the resistance of a nutrient system to changes in flow rates. This is applicable to situations such as continual harvesting, drought, and gradual discharge of pollutants rather than catastrophic events such as floods or dumping pollutants. The theory was tested on 8 hypothetical ecosystems: tundra, grassland, temperate forests, tropical forests, ocean, lake, salt marsh, and stream. Some of the hypotheses obtained were: (1) The ratio of the net imbalance in the perturbed flow rates to the total outflow determines the ultimate displacement of nutrient levels relative to their original equilibrium levels. (2) The rate of displacement caused by a small disturbance in flow rate is about the same as the rate of return following a perturbation of the nutrient concentrations. (3) The rate of displacement is measured by eigenvalues, which are greater at high flow rates and fast turnover times. (4) The critical root is approximately total outflow divided by total nutrients in systems with relatively small outflows. (5) Aquatic systems have faster response rates than terrestrial systems. (6) Any terrestrial system which has been disturbed within the last 1,000 years may not be in equilibrium; therefore it cannot be assumed that inflows and outflows are in balance. (Cassar-FRC)

EVALUATION OF A DISTRIBUTED PARAMETER AND A LUMPED PARAMETER MODEL FOR USE IN WATER QUALITY MODELING
Maryland Univ., College Park. Dept. of Agricultural Engineering.
M. Yarmanoglu, J. E. Ayars, and G. K. Felton.
In: Nonpoint Pollution Control -- Tools and Techniques for the Future, Proceedings of a Technical Symposium, p 119-128, 1981. 7 Fig, 7 Ref.

Descriptors: *Hydrographs, *Model studies, *Water quality, *Mathematical models, Estimating, Flow characteristics, Cultivation, Land use, Planting management, Soil management, Erosion, Watersheds(Basins), Computer models, Storm runoff.

A comparison of a Distributed Parameter Model (DPM) for simulating hydrographs from natural watersheds and the University of Maryland version of the USDAHL model, a quasi-lumped continuous simulation model, shows that the DPM does a better job of simulating storm hydrographs. DPM, a distributed parameter watershed model, has three main components: overland flow, subsurface flow, and channel flow. DPM uses the finite element method with kinematic wave approximations to solve one-dimensional flow equations. USDAHL treats a watershed as a topographical sequence of response zones. Its two main components are overland flow and subsurface flow. DMP is basically a research model while USDAHL is an applications oriented model. Both models, were applied to two research watersheds, one with conventional tilling and one with 'no-till'. DPM has a high degree of simulation accuracy which justifies its relatively high computing costs. The use of DPM to simulate storm hydrographs from within the USDAHL would combine the advantages of both models. (See also W81-02276) (Seigler-IPA)

PREDICTABILITY OF CHANGE IN SOIL REFLECTANCE ON WETTING,
Purdue Univ., IN. Water Resources Research Center, Lafayette, IN.
J. B. Peterson, B. F. Robinson, and R. H. Beck.
In: Machine Processing of Remotely Sensed Data Symposium, p 264-273, 1979. Institute of Electrical and Electronic Engineers, 345 East 47th St, NY. Catlog No 79 Ch 1430-8 MPRSD. Symposium held June 27-29, 1979, Purdue University, West Lafayette, Indiana. OWRT-A-061-IND(1).

Descriptors: *Soil moisture, *Moisture tension, Forecasting, *Remote sensing, *Reflectance, Soil water, Wetting, Soil wetting, Soil reflectance.

The loss of reflectance from the oven dry state to field capacity for 15 surface soils from Central Indiana, representative of the Mollisol and Alfisol great soil groups, is definitely related to the oven dry reflectances of the soils. A regression analysis of the relationship of the darkening effect of wetting on the reflectance of the soils when dry results in regression curves with R super 2 values ranging from .9914 to .9291 over the five wavelength bands used, .52-.58 mu, .71 mu, .76-.90 mu, .90-1.22 mu and 1.50-1.73 mu. Furthermore, striking evidence of the predictability of soil moisture tensions from reflectance data was noted when the regression curves at .71 mu were run for the reflectance values of the 15 soils at 15 bar and 1/3 bar against their reflectances when oven dry. When the reflectances at 15 bar were plotted against those of the same samples when oven dry an R super 2 of 0.95 was found. Similarly, when data for reflectances of the 15 soils at 1.3 bar were plotted against the oven dry reflectances, an R super 2 of .96 was computed. This evidence strongly supports the thesis that moisture tensions of soils can be predicted from reflectance measurements.

WATER RESOURCES DATA FOR FLORIDA, WATER YEAR 1979--VOLUME 2B. SOUTH FLORIDA GROUNDWATER.
Geological Survey, Tallahassee, FL. Water Resources Div.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-183493, Price codes: A24 in paper copy, A01 in microfiche. Geological Survey Water-Data Report FL-79-2B, December 1980. 558 p, 18 Fig, 1 Tab, 9 Ref.

Descriptors: *Florida, *Hydrologic data, *Groundwater, *Water quality, Water analysis, Water temperature, Chemical analysis, Water wells, Water levels, Data collections, Sites, *South Florida.

Water resources data for the 1979 water year for south Florida include continuous groundwater levels for 192 wells, periodic groundwater levels for 808 wells, and quality of water for 358 wells. These data represent the National Water Data System records collected by the U.S. Geological Survey and cooperating local, State, and Federal agencies in Florida. (USGS)
W81-02342

CHEMICAL ANALYSES FOR SELECTED WELLS IN SAN JOAQUIN COUNTY AND PART OF CONTRA COSTA COUNTY, CALIFORNIA,
Geological Survey, Menlo Park, CA. Water Resources Div.
G. L. Keeter.
Available from the OFSS, USGS Box 25425, Fed. Ctr., Denver, CO 80225, Price: $9.50 in paper copy, $3.50 in microfiche. Geological Survey Open-File Report 80-420, 1980. 70 p, 3 Fig, 50 Maps, 3 Tab.

Descriptors: *Chemical analysis, *Groundwater, *Water wells, *California, Water chemistry, Well data, *San Joaquin Valley(CA), *San Joaquin County(CA), *Contra Costa County(CA).

The study area of this report includes the eastern valley area of Contra Costa County and all of San Joaquin County, an area of approximately 1,600 square miles in the northern part of the San Joaquin Valley, Calif. Between December 1977 and December 1978, 1,489 wells were selectively canvassed. During May and June in 1978 and 1979, water samples were collected for chemical analysis from 321 of these wells. Field determinations of alkalinity, conductance, pH, and temperature were made, and individual constituents were analyzed. This report is the fourth in a series of baseline data reports on wells in the Sacramento and San Joaquin Valleys. (USGS)

SIMULATION OF WATER-QUALITY DATA AT SELECTED STREAM SITES IN THE MISSOURI RIVER BASIN, MONTANA,
Geological Survey, Helena, MT. Water Resources Div.
J. R. Knapton, and M. A. Jacobson.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-125023, Price codes: A03 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 80-76, September, 1980. 30 p, 2 Fig, 4 Tab, 5 Ref.

Descriptors: *Water quality, Hydrologic data, *Model studies, *Missouri River, *Montana, Simulation analysis, Specific conductivity, Simulated solute concentrations.

Modification of sampling programs at some water-quality stations in the Missouri River basin in Montana has eleminated the means by which solute loads have been directly obtained in past years. To compensate for this loss, water-quality and streamflow data were statistically analyzed and solute loads were simulated using computer techniques. Functional relationships existing between specific conductance and solute concentration for monthly samples were used to develop linear regression models. The models were then used to simulate daily solute concentrations using daily specific conductance as the independent variable. Once simulated, the solute concentrations, in milligrams per liter, were transformed into daily solute loads, in tons, using mean daily streamflow records. Computer output was formatted into tables listing simulated mean monthly solute concentrations, in milligrams per liter, and the monthly and annual solute loads, in tons, for water years 1975-78. (USGS)

HYDROLOGIC MONITORING PROGRAM IN ELDRIDGE-WILDE AND EAST LAKE ROAD WELL-FIELD AREAS, PINELLAS AND HILLSBOROUGH COUNTIES, FLORIDA, 1978,
Geological Survey, Tallahassee, FL. Water Resources Div.
L. R. Mills.
Available from the OFSS, USGS Box 25425, Fed. Ctr., Denver, CO 80225, Price: $3.50 in paper copy, $3.50 in microfiche. Geological Survey Open-File Report 80-1195, 1980. 23 p, 15 Fig, 4 Tab, 9 Ref.

Descriptors: *Hydrologic data, *Monitoring, *Saline water-freshwater interface, *Florida, *Observation wells, Water levels, Pumping, Drawdown, Regulation, Groundwater, Aquifers, Rainfall, Water table, Potentiometric level, Water quality, Chlorides, *Floridan aquifer, Pinellas County(FL), Hillsborough County(FL), Well fields.

This report describes the observation-well network in Eldridge-Wilde and East Lake Road well-field areas, Pinellas and Hillsborough Counties, Florida. Data obtained in 1978 from the network in and adjacent to the two well fields, as well as rainfall and pumpage records, are presented. The Southwest Florida Water Management District has established regulatory water-level limits in four observation wells and water-quality limits in three observation wells. Water levels dropped below regulatory limits in the spring of 1978 in three wells. Chloride concentrations in 1978 remained above regulatory limits for the entire year in one well and exceeded the limit during the late spring in the other two deep wells, both west of Eldridge-Wilde well field. APPROXIMATE LAND-SURFACE SUBSIDENCE IN THE HOUSTON-GALVESTON REGION, TEXAS, 1906-78, 1943-78, AND 1973-78,
Geological Survey, Houston, TX. Water Resources Div.
R. K. Gabrysch.
Available from the OFSS, USGS Box 25425, Fed. Ctr., Denver, CO 80225, Price: $1.00 in paper copy, $3.50 in microfiche. Geological Survey Open-File Report 80-338, March, 1980. 3 Fig, 1 Ref, 3 Sheets.

Descriptors: *Maps, *Land subsidence, *Groundwater, *Aquifers, *Texas, Compaction, Harris County(TX), Artesian pressures, Water-level declines.

This report consists of three maps that show approximate land-surface subsidence in the Houston-Galveston region, Texas, during the periods 1906-78, 1943-78, and 1973-78. The data, which are based on releveling by the National Geodetic Survey, show that subsidence has accelerated in the western part of Harris County. (USGS)

HYDROGEOLOGIC DATA FOR SOUTH CENTRAL CONNECTICUT,
Geological Survey, Hartford, CT. Water Resources Div.
F. P. Haeni, and H. R. Anderson.
Connecticut Department of Environmental Protection Water Resources Bulletin No 32, 1980. 43 p, 3 Fig, 2 Tab, 4 Ref, 1 Plate.

Descriptors: *Groundwater resources, *Water wells, Data collections, *Well data, *Connecticut, Hydrogeology, Aquifer characteristics, Water yield, Test wells, Water levels, *Hydrologic data, Drillers logs, Geophysics, Porosity, Velocity, Hydrographs, Maps, *South-central Connecticut.

Subsurface hydrogeologic data for selected stratified-drift aquifers in south-central Connecticut was collected during the period 1974 to 1980, as part of a program to determine their water-yielding potential. This report includes: (1) Geologic logs, describing the aquifer materials in 233 test holes and 18 test wells, (2) the interpretation of three, seismic refraction profiles, one of which indicates that the stratified drift may be as much as 425 feet thick in Plainville, Conn., (3) hydrographs showing water-level fluctuations in 11 observation wells, and (4) the porosites and compressional velocities of fifteen core samples of Triassic-Jurassic sedimentary rocks that underlie the stratified drift. (USGS)

PRINCIPAL AQUIFERS AND WELL YIELDS IN WASHINGTON,
Geological Survey, Tacoma, WA. Water Resources Div.
D. Molenaar, P. Grimstad, and K. L. Walters.
Washington Department of Ecology, Geohydrologic Monograph 5, 1980. 38 Ref, 1 Sheet.

Descriptors: *Groundwater, *Aquifers, *Water wells, *Water yield, *Washington, Aquifer characteristics, Basalts, Sedimentary rocks, Glacial drift, Alluvium, Maps.

The principal aquifers supplying water to wells in Washington State are (1) basalt and associated sedimentary interbeds of the Columbia River Basalt Group of Miocene age, (2) sedimentary deposits of Miocene to early Pleistocene age, (3) glacial drift of Pleistocene age, and (4) alluvium of Quaternary age. Yields of wells tapping these aquifers range from a few gallons per minute to more than 3,000 gal/min (gallons per minute) from the basalt and alluvium, to 1,000 gal/min from the sedimentary deposits, and as much as 10,000 gal/min from the glacial drift. W81-02358

GROUNDWATER DATA, 1969-77, VANDENBERG AIR FORCE BASE AREA, SANTA BARBARA COUNTY, CALIFORNIA,
Geological Survey, Menlo Park, CA. Water Resources Div.
C. E. Lamb.
Available from the OFSS, USGS Box 25425, Fed. Ctr., Denver, CO 80225, Price: $9.50 in paper copy, $4.00 in microfiche. Geological Survey Open-File Report 80-736, June, 1980. 50 p, 3 Fig, 2 Tab, 6 Ref, 1 Plate.

Descriptors: *Groundwater resources, *Water wells, Pumping, *Water yield, *Water levels, *Water quality, Chemical analysis, Water analysis, Data collections, Water level fluctuations, California, *San Antonio Valley(CA), *Santa Barbara County(CA), Lompoc Plain(CA), *Vandenberg Air Force Base(CA).

The water supply for Vandenberg Air Force Base is obtained from wells in the Lompoc Plain, San Antonio Valley, and Lompoc Terrace groundwater basins. Metered pumpage during the period 1969-77 from the Lompoc Plain decreased from a high of 3,670 acre-feet in 1969 to a low of 2,441 acre-feet in 1977, while pumpage from the San Antonio Valley increased from a low of 1,020 acre-feet in 1969 to a high of 1,829 acre-feet in 1977. Pumpage from the Lompoc Terrace has remained relatively constant and was 187 acre-feet in 1977. In the Barka Slough area of the San Antonio Valley, water levels in four shallow wells declined during 1976 and 1977. Water levels in observation wells in the two aquifers of the Lompoc Terrace ground-water basin fluctuated during the period, but show no long term trends. Chemical analyses or field determinations of temperature and specific conductance were made of 219 water samples collected from 53 wells. In the Lompoc Plain the dissolved-solids concentration in all water samples was more than 625 milligrams per liter, and in most was more than 1,000 milligrams per liter. The manganese concentration in analyzed samples equaled or exceeded the recommended limit of 50 micrograms per liter for public water supplies. Dissolved-solids concentrations increased with time in water samples from two wells east of the Air Force Base in San Antonio Valley. In the base well-field area, concentrations of dissolved solids ranged from 290 to 566 milligrams per liter. Eight analyses show manganese at or above the recommended limit of 50 milligrams per liter. In the Lompoc Terrace area dissolved-solids concentrations ranged from 470 to 824 milligrams per liter. Five new supply wells, nine observation wells, and two exploratory/observation wells were drilled on the base during the period 1972-77. (USGS)
W81-02359

DRAINAGE AREAS OF SELECTED SURFACE-WATER SITES IN FLORIDA,
Geological Survey, Tallahassee, FL. Water Resources Div.
D. W. Foose.
Available from the OFSS, USGS Box 25425, Fed. Ctr., Denver, CO 80225, Price: $11.00 in paper copy, $3.50 in microfiche. Geological Survey Open-File Report 80-957, 1980. 81 p, 1 Fig, 3 Tab, 3 Ref.

Descriptors: *Drainage areas, *Surface waters, *Florida, *Streams, *Lakes, Sites, Hydrologic data.

Drainage areas for about 1,500 surface-water sites on streams and lakes in Florida are contained in this report. Sites are described in relation to a nearby city or town, and are located by county, by latitude-longitude, and by topographic map on which it is located. In addition, the surface areas of lakes are shown for the elevation given on the topographic map. These data were retrieved from the Surface Water Index developed and maintained by the Hydrologic Records Section of the Florida District office of the U.S. Geological Survey.
W81-02371

POTENTIOMETRIC SURFACE MAP OF WATER IN THE MADISON GROUP, MONTANA,
Geological Survey, Billings, MT. Water Resources Div.
R. D. Feltis.
Available from the Mont. Bureau of Mines and Geology, Butte, Mont., Price: $2.50 in paper copy. Montana Bureau of Mines and Geology Hydrogeologic Map 2, 1980. 1 Sheet, 1 Ref.

Descriptors: *Maps, *Potentiometric level, *Geohydrologic units, *Groundwater, *Montana, Water levels, Hydrogeology, Carbonate rocks, Deep wells, Hydraulic gradient, Madison Group (MT).

The configuration of the potentiometric surface of water in the Madison Group, of Mississippian age, is shown by contours on a base map at a scale of 1:1,000,000. The map is one of a series of maps produced as part of a regional study of the geohydrology of the Madison Group in Montana. Other maps in the series show the general quality of water in the Madison aquifer at a scale of 1:1,000,000 and the configuration of the top of the Madison Group at a scale of 1:250,000. The configuration map shows that the hydraulic gradient is away from the principal recharge areas in several mountain ranges and toward the northwestern, north-central and northeastern parts of the State. Data are from oil tests or production wells, water wells, and springs. The altitude of the potentiometric surface at most sites was calculated from oil well drill-stem-test data. The data range in age from 1940 to 1977. (USGS)

SUMMARY GROUNDWATER RESOURCES OF CENTRE COUNTY, PENNSYLVANIA,
Geological Survey, Harrisburg, PA. Water Resources Div.
C. R. Wood.
Pennsylvania Department of Environmental Resources, Harrisburg. Water Resources Report 48, 1980. 60 p, 5 Fig, 1 Plate, 7 Tab, 62 Ref.

Descriptors: *Groundwater resources, *Aquifer characteristics, *Hydrogeology, *Water yield, *Pennsylvania, Water quality, Well data, Water levels, Petrology, Drawdown, Groundwater recharge, Water analysis, Water wells, Surface groundwater relationships, Centre County(PA).

The northwest third of Centre County, Pa., lies in the Appalachian Plateaus physiographic province. The principal aquifers are the Allegheny Group, Pottsville Group, and Burgoon Sandstone. The average yield of nondomestic wells is 20 gal/min (gallons per minute) in the Allegheny, 100 gal/min in the Pottsville, and 70 gal/min in the Burgoon. Water from the Allegheny and Pottsville Groups is commonly high in iron. The southeast two-thirds of the county lies in the Appalachian Mountain section of the Valley and Ridge physiographic province. The average yield of nondomestic wells is less than 100 gal/min from most of the 33 formations in this section. However, average yields of 200 gal/min or more can be obtained from the Old Port, Keyser, Tonoloway, Wills Creek, Nittany, and Gatesburg Formations. The water occurs in fractures, solution-enlarged in carbonate rocks. Thus, the noncarbonate rocks are susceptible to overpumping, and the carbonate-rock aquifers are easily contaminated. At least 10 springs have average discharges in excess of 1,000 gal/min. Wells along fracture traces generally have much higher yields than those off the fracture traces. Wells in valleys generally have higher yields than those on hillsides and hilltops. (USGS)

WATER-RESOURCES INVESTIGATIONS OF THE U.S. GEOLOGICAL SURVEY IN MISSOURI--FISCAL YEAR 1980.
Geological Survey, Rolla, MO. Water Resources Div.
Available from the OFSS, USGS Box 25425, Fed. Ctr., Denver, CO 80225, Price: $8.50 in paper copy, $3.50 in microfiche. Geological Survey Open-File Report 80-1019, August, 1980. 64 p, 2 Fig, 5 Tab, (Compiled by Kratzer, W. M.).

Descriptors: *Water resources, *Projects, Programs, *Water quality, *Missouri, Publications, *Streamflow, Bibliographies, Data collections, Sites, Hydrologic data, Networks, Gaging stations, Crest-stage gages, Low flow, Urban runoff, Reviews, Rainfall, Runoff, Flow rates, Low flow.

Water-resources investigations of the U.S. Geological Survey in Missouri consist of collecting hydrologic data and conducting interpretative investigations. The data and the results of the investigations are published or released by either the U.S. Geoloogical Survey or by cooperating agencies. The report describes the data-collection activities and investigations in Missouri for the 1980 fiscal year and provides an extensive list of water-resources references for the State. (USGS)

QUALITY OF WATER IN THE PEARL RIVER, JACKSON TO BYRAM, MISSISSIPPI, SEPTEMBER 21-22, 1976,
Geological Survey, Jackson, MS. Water Resources Div.
G. A. Bednar.
Available from the OFSS, USGS Box 25425, Fed. Ctr., Denver, CO 80225, Price: $5.00 in paper copy, $3.50 in microfiche. Geological Survey Open-File Report 80-575, 1980. 36 p, 6 Fig, 2 Tab, 14 Ref.

Descriptors: *Water quality, *Data collections, *Streamflow, *Water resources, *Mississippi, Surface waters, Low flow, Water utilization, Water analysis, Water properties, Bacteria, Water pollution, Pesticides, Hydrologic data, *Pearl River(MS), Hinds County(MS), Rankin County(MS).

The Pearl River in Mississippi, entering the study reach at site 1 at Jackson, was generally higher in dissolved-oxygen concentrations and lower in dissolved-solids, nutrients, and biochemical oxygen demands than at site 13 at Byram 11.8 miles downstream of site 1 and about 11 river miles downstream of treated sewage inflow. The dissolved oxygen concentrations of the water ranged from 6.4 to 7.8 milligrams per liter at site 1, and from 4.9 to 7.4 milligrams per liter at site 13. The average dissolved-solids concentrations were 60 and 97 milligrams per liter at sites 1 and 13, respectively. The average dissolved-solids load increased downstream about 35 tons per day. The average loads of 5-day biochemical oxygen demand, total phosphorus, and ammonia increased downstream about 2, 0.7, and 0.6 tons per day, respectively. The water in the study reach contained color, total iron, and manganese concentrations that exceeded limits recommended for public water supplies. Trace amounts of some pesticides and minor elements were present in both the water and bottom material at sites 1 and 13. The concentrations of most dissolved constituents were below recommended limits during the study and the Pearl River in the study reach may be considered usable for many purposes. (USGS)
W81-02392

SUMMARY OF WATER-QUALITY DATA FOR SELECTED STREAMS IN COLORADO,
Geological Survey, Lakewood, CO. Water Resources Div.
M. W. Gaydos.
Available from the OFSS, USGS Box 25425, Fed. Ctr., Denver, CO 80225, Price: $23.25 in paper copy, $4.50 in microfiche. Geological Survey Open-File Report 80-682 (WRI), 1980. 148 p, 9 Fig, 2 Tab, 7 Ref, 2 Plates.

Descriptors: *Water quality, *Data collections, *Rivers, *Colorado, Surface waters, Sampling, Sites, Regression analysis, Chemical analysis, Inorganic compounds, *Trace elements, Nutrients, Specific conductivity.

This report presents the first statewide summary of water-quality data for selected streams in Colorado. Included in the report are a tabulation of the 165 surface-water-sampling sites for which five or more analyses of major chemical constituents were available at the end of the 1978 water year and a tabulation of the types--major chemical constituents, trace or minor elements, biological constituents, pesticides, or radio-chemicals--and number of water-quality analyses available at each of the 165 sites. Also included are statistical summaries, including regression summaries showing the relation between specific conductance and major chemical constituents, for 117 sites for which 20 or more analyses of major chemical constituents are available. Examples of linear-regression plots of specific conductance and selected major chemical constituents based on data from the Eagle River at Gypsum, Colo., are presented. Decisions to modify the frequency of collection or the types of constituents determined at many sites are facilitated by the statistal summaries. (USGS)

RIVER SEVERN SUPPLY SCHEME - DEVELOPMENT OF UPTON INTAKE WORKS,
Water Services, Vol 84, No 1015, p 561-563, September, 1980. 3 Fig.

Descriptors: *Severn River, *Severn Trent Waterway, *Intakes, Hydraulic structures, Engineering structures, Pumps, Intake structures, *Water supply, *England, Coventry area.

The River Severn Scheme for water source control is divided into five major components: Upton intake works, Strensham Treatment Works, River Severn pipeline, Henley in Arden booster station, and Meriden service reservoirs. The Upton Intake Works forms the foundation of the whole system and is described in depth, with information offered concerning the River Severn, the intake structure, the tunnel and the sump. At peak demands high abstraction rates were seen to draw the water level down dangerously near to the minimum pumping level, indicating that proposed increases in the quantity of water could not be met by the existing intake works. During a recent study areas of high head losses were identified, and modifications were undertaken to increase the maximum possible abstraction rate. With the changes the complete flow system, including the intake structure with new bandscreens, tunnel and the existing sump, was able to sustain a throughput in the region of 200 million liters/day. The abstraction rate was now limited by the physical size of the pumps. Changes in the pumps themselves allowed the capacity of the system to be increased. (Baker-FRC)

CONTAINMENT AREA DESIGN FOR SEDIMENTATION OF FINE-GRAINED DREDGED MATERIAL,
Army Engineers Waterways Experiment Station, Vicksburg, MS. Environmental Lab.
R. L. Montgomery.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-173825, Price codes: A13 in paper copy, A01 in microfiche. In: Management of Bottom Sediments Containing Toxic Substances, Proceedings of the Fifth United States-Japan Experts Meeting, Nov 1979, New Orleans, LA. Environmental Protection Agency Rpt EPA-600/9-80-044, Sep 1980, p 229-257. 13 Fig, 2 Tab, 9 Ref.

Descriptors: *Sediments, *Dredging, *Water quality control, *Water quality standards, Waste disposal, *Settling basins, Suspended solids, Ponding, Flocculation, Particle size, Sediment load, Organic matter, Specific gravity, Physical properties.

Procedures are developed for designing fine-grained dredged material sedimentation basins to provide adequate retention of suspended solids so that required effluent suspended solids levels can be met. Separate design procedures for freshwater and saltwater sediments provide for determination of the respective surface area or detention time required to accommodate continuous dredged material disposal. Procedures are also given for esti-

mation of the storage volume required for a single disposal activity and the corresponding ponding depths, freeboard requirements, and dike heights. Laboratory tests required to obtain data for sediment charactarization, containment area design, and estimates of long term storage capacity are described. These tests include salinity determination of near bottom water and natural water content, Atterburg limits, organic content, specific gravity, and grain size analysis of the sediments. Flocculent setting tests, generally applicable to freshwater sediments, are described. (Brambley-SRC)

8B. Hydraulics

DYNAMIC-WAVE MODELING OF STORM SEWERS WITH SURCHARGE.
Illinois Univ. at Urbana-Champaign. Dept. of Civil Engineering.
N. Pansic.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-182206, Price codes: A06 in paper copy, A01 in microfiche. MS Thesis, 1980. 102 p, 45 Fig, 12 Tab, 11 Ref. OWRT-A-086-ILL(3), 14-31-0001-9015.

Descriptors: Computer models, Conduit flow, Drainage systems, Flood routing, *Storm sewers, Hydraulics, Hydrographs, Mathematical models, Open-channel flow, *Dynamics, *Sewers, Sewer systems, *Storm drains, Storm runoff, *Unsteady flow, Urban drainage.

Although storm sewers are normally designed for open-channel flow, the sewers may flow under pressure, i.e. surcharge, for a number of reasons. This study investigates the surcharge problem in small dendritic networks. The theory of storm sewer hydraulics is briefly reviewed. The application of the theoretical equations to the surcharge problem, through the use of numerical techniques, is described. A computer simulation model of open-channel, surcharge and transitional flows in networks is developed . The model capabilities are demonstrated by two example applications. The simulation results are presented and discussed.

8H. Rapid Excavation

GROUND FREEZING HALTS SEWER COLLAPSE.
American City and County, Vol 95, No 9, p 85, September, 1980.

Descriptors: *Freezing, *Interceptor sewers, *Ice-brine systems, Engineering structures, Calcium chloride, Temperature, Brines, Sewerage, Coolants, Methodology, Excavation, Tunneling, Nitrogen, Maintenance, Groundwater, *Sewer repairs, Detroit, Pipelines.

Refrigerated calcium chloride brine was injected into the ground to stabilize soil and stop groundwater flow during repair of a large interceptor sewer in Detroit. The technique was developed for use in Welsh coal mines in the nineteenth century. Calcium chloride can be replaced by liquid nitrogen to reduce the time required to freeze the soil. The method has little or no long term effect on soil or the water table. The freeze used to repair the sewer in Detroit consumed 500 tons of liquid nitrogen and required 54 days. This method has very high costs and may be unsuitable for some groundwater regimes.

AN ANNOTATED BIBLIOGRAPHY OF DEVICES DEVELOPED FOR DIRECT MEASUREMENT OF SEEPAGE,
Geological Survey, Denver, CO. Water Resources Div.
M. R. Carr, and T. C. Winter.
Available from the OFSS, USGS Box 25425, Fed. Ctr., Denver, CO 80225, Price: $5.25 in paper copy, $3.50 in microfiche. Geological Survey Open-File Report 80-344, January, 1980. 38 p, 14 Fig.

Descriptors: *Bibliographies, *Instrumentation, *Seepage, *Measurement, Lake beds, Percolation, Surface-groundwater relationships, Groundwater movement, Seepage meters, Hydraulic potential probes, Seepage measurement.

The need for information on the interrelationship of groundwater and surface water is causing a growing interest in methods used for direct measurement of seepage to and from surface-water bodies. Instruments developed for measurement of seepage date from about the mid 1940's largely in response to the need for knowing the quantity of seepage loss from canals. This bibliography includes abstracts, summaries, or conclusions from papers describing seepage measurement devices. Illustrations of the instruments are included. (USGS)

SUBJECT INDEX

2

Degradation of the Herbicide 2,4-D in River Water - I. Description of Study Area and Survey of Rate Determing Factors,
W81-02152 5B

Degradation of the Herbicide 2,4-D in River Water - II. The Role of Suspended Sediment, Nutrients and Water Temperature,
W81-02153 5B

208 PLANS

The Development and Content of the Agricultural Component of the Maryland 208 Plan,
W81-02302 5G

ABSORPTION

Efficiency and Rate of Elimination of Polychlorinatd Biphenyls from Waste Waters by Means of Algae,
W81-02227 5D

Spectral Absorption Properties of Natural Waters: Contribution of the Soluble and Particulate Fractions to Light Absorption in Some Inland Waters of South-Eastern Australia,
W81-02235 2H

ACTIVATED CARBON

Design and Economics of Powdered Activated Carbon in the Activated Sludge Process,
W81-02158 5D

ACTIVATED SLUDGE

Design and Economics of Powdered Activated Carbon in the Activated Sludge Process,
W81-02158 5D

Experience in Operating the Deep Shaft Activated Sludge Process,
W81-02159 5D

The Activated Sludge Process Part 2. Application of the General Kinetic Model to the Contact Stabilization Process,
W81-02160 5D

Intensified Biological Waste Water Treatment City of Frankfurt AM Main,
W81-02162 5D

Control of Nitrification in the Oxygen Activated Sludge Process,
W81-02163 5D

Odours Emitted by BASF AG's Activated Sludge Plant Treating Chemical Works Effluent in Ludwigshafen/Rhine,
W81-02169 5D

The Design of Two Plants for Biological Removal of Nutrients,
W81-02175 5D

Component Mix Meets Tough Standards,
W81-02187 5D

Nonlinear Models of Biological Treatment Processes,
W81-02196 5D

Reduced-Order Modelling of the Activated-Sludge Process,
W81-02197 5D

The Treatment of Mixed Industrial and Domestic Sewage Using Chemical and Biological Treatment at Davyhulme Advanced Waste Water Treatment Pilot Plant,
W81-02203 5D

AERATION

Development Trends in Construction and Chemical Engineering of Biological Waste Water Treatment Plants, Taking Hoechstag as an Example,
W81-02168 5D

On the Reduction of Odour Emissions by Covering Surface Aeration Tanks,
W81-02173 5D

Hydraulic Losses in Biological Reactors with Circulating Flows,
W81-02176 5D

AGRICULTURAL RUNOFF

Nonpoint Pollution Data Collection Problems on Low Flat Coastal Topography,
W81-02285 5B

A Field-Scale Model for Nonpoint Source Pollution Evaluation,
W81-02290 5A

Pollutant Export from Small Catchments Exhibiting Different Agricultural Uses and Management Practices,
W81-02298 5B

The Development and Content of the Agricultural Component of the Maryland 208 Plan,
W81-02302 5G

Selection of Potentially Critical Areas for Agricultural Livestock Waste in Maryland,
W81-02303 6B

AGRICULTURAL WATERSHEDS

Nonpoint Contributions from Agricultural Activities in the Maryland Piedmont,
W81-02288 5B

AGRICULTURE

The Prairie Plan - The First Decade, The Second Decade - The United States' Largest Recycling System,
W81-02172 5E

Fate of Petroleum Hydrocarbons in Sewage Sludge After Land Disposal,
W81-02226 5E

AIR POLLUTION EFFECTS

Airborne Organic Contaminants in the Great Lakes Ecosystem,
W81-02202 5B

ALASKA

Kinetic Study of the Biodegradation of Biphenyl and its Monochlorinated Analogues by a Mixed Marine Microbial Community,
W81-02199 5B

Data from a Hydrologic Reconnaissance of the Beluga, Peters Creek, and Healy Coal Areas, Alaska,
W81-02385 5B

ALGAE

The Composition and Ecology of Periphyton Communities in Freshwaters. I. The Influence of Host Type and External Environment on Community Composition,
W81-02182 5C

Use of an In Situ Artificial Substrate for Biological Accumulation and Monitoring of Aqueous Trace Metals--A Preliminary Field Investigation,
W81-02192 5A

Nonlinear Models of Biological Treatment Processes,
W81-02196 5D

Significance of Algal Extracellular Products to Bacteria in Lakes and in Cultures,
W81-02216 2H

Differential Filtration Studies of Carbon Flux from Living Algae to Microheterotrophs, Microplankton Size Distribution and Respiration in Lake Kinneret,
W81-02217 2H

Algal Assay Studies of Waste Water Polluted Lakes,
W81-02224 5A

Efficiency and Rate of Elimination of Polychlorinatd Biphenyls from Waste Waters by Means of Algae,
W81-02227 5D

ALGAE CONTROL

Magnesium Coagulation of Oxidation Pond Effluent,
W81-02267 5D

ALLUVIAL AQUIFERS

Planning Report for the Southwest Alluvial Basins (East) Regional Aquifer-System Analysis, Parts of Colorado, New Mexico, and Texas,
W81-02360 6A

ALUMINUM INDUSTRY

Advanced Treatment of Aluminum Industry Effluent for Non-Potable Reuse,
W81-02263 5D

AMMONIA

Reliability of an Electrode and a Water Analysis Kit for Determination of Ammonia in Aquaculture Systems,
W81-02180 5A

ANADROMOUS FISH

Proposed Trinity River Basin Fish and Wildlife Management Program, Appendix C, Fish and Wildlife Analysis, Final, Volume 1.
W81-02332 6G

ANAEROBIC CONDITIONS

Anaerobic Metabolism of Particulate Organic Matter in the Sediments of a Hypereutrophic Lake,
W81-02241 2H

ANALYTICAL TECHNIQUE

Flow Injection Analysis Using Potassium Permanganate: An Approach for Measuring Chemical Oxygen Demand in Organic Wastes and Waters,
W81-02165 5A

ANALYTICAL TECHNIQUES

Adhesion-Binding of 2,2',4,4',5'5'-Hexachlorobiphenyl to Glass and Plastic: A Possible Source of Error for PCB Analysis,
W81-02229 5A

Semiautomated Determination of Total Phosphorus and Total Kjeldahl Nitrogen in Surface Waters,
W81-02248 5A

Determination of Uranium by Thermal and Epithermal Neutron Activation in Natural Waters and in Human Urine,
W81-02249 5A

Sampling, Preservation, and Analysis of Sediment Samples: State-of-the-Art Limitations,
W81-02325 7A

AQUACULTURE

Reliability of an Electrode and a Water Analysis Kit for Determination of Ammonia in Aquaculture Systems,
W81-02180 5A

AQUATIC ANIMALS

Mercury Accumulation in Biota of Thunder Creek, Saskatchewan,
W81-02228 5A

AQUATIC HABITAT

Proposed Trinity River Basin Fish and Wildlife Management Program, Appendix B, Sediment and Related Analysis, Final.
W81-02331 6G

AQUATIC HABITAT

Proposed Trinity River Basin Fish and Wildlife Management Program, Appendix C, Fish and Wildlife Analysis, Final, Volume 1.
W81-02332 6G

AQUATIC LIFE
Biology of the North Arm,
W81-02309 5C

AQUATIC PLANTS
Aquatic Macrophytes as Indicator for Heavy Metal Pollution in the River Leine (West Germany). (Makrophytische Wasserpflanzen Als Bioindikatoren Fur Die Schwermetall-Belastung Der Oberen Leine),
W81-02252 5A

AQUATIC POPULATIONS
Proposed Trinity River Basin Fish and Wildlife Mangement Program, Appendix C, Fish and Wildlife Analysis, Final, Volume 2.
W81-02333 6G

AQUIFER CHARACTERISTICS
Paleohydrology of the Southern Great Basin, with Special Reference to Water Table Fluctuations Beneath the Nevada Test Site During the Late( ) Pleistocene,
W81-02372 5E

Summary Groundwater Resources of Centre County, Pennsylvania,
W81-02375 7C

AQUIFER MANAGEMENT
Planning Report for the Southwest Alluvial Basins (East) Regional Aquifer-System Analysis, Parts of Colorado, New Mexico, and Texas,
W81-02360 6A

AQUIFER SYSTEMS
Planning Report for the Southwest Alluvial Basins (East) Regional Aquifer-System Analysis, Parts of Colorado, New Mexico, and Texas,
W81-02360 6A

AQUIFER TESTING
Aquifer Tests in the Gallup Sandstone Near Yah-Ta-Hey, New Mexico,
W81-02397 2F

AQUIFERS
Analytical Study of the Ogallala Aquifer in Hansford County, Texas, Projections of Saturated Thickness, Volume of Water in Storage, Pumpage Rates, Pumping Lifts, and Well Yields,
W81-02336 4B

Analytical Study of the Ogallala Aquifer in Ochiltree County, Texas, Projections of Saturated Thickness, Volume of Water in Storage, Pumpage Rates, Pumping Lifts, and Well Yields,
W81-02337 4B

Approximate Land-Surface Subsidence in the Houston-Galveston Region, Texas, 1906-78, 1943-78, and 1973-78,
W81-02355 7C

Hydrogeology of the Town of North Hempstead, Nassau County, Long Island, New York,
W81-02357 2F

Principal Aquifers and Well Yields in Washington,
W81-02358 7C

Cape Code Aquifer, Cape Cod, Massachusetts,
W81-02364 2F

Reconnaissance of Groundwater in the Vicinity of Gunnison and Crested Butte, West-Central Colorado,
W81-02381 4B

Saline Water at the Base of the Glacial-Outwash Aquifer Near Vincennes, Knox County, Indiana,
W81-02396 2F

Geohydrology and Digital-Simulation Model of the Farrington Aquifer in the Northern Coastal Plain of New Jersey,
W81-02398 2F

Groundwater in the Piedmont Upland of Central Maryland,
W81-02400 2F

ARCHITECTURE
Winning Design Satisfies Diverse Needs,
W81-02188 5D

ARCTIC
Vertical Migrations of Zooplankton in the Arctic: A Test of the Environmental Controls,
W81-02312 2H

ARID LANDS
Runoff Calculation on Semi-Arid Watersheds Using a Rotadisk Rainulator,
W81-02155 2E

ARIZONA
Runoff Calculation on Semi-Arid Watersheds Using a Rotadisk Rainulator,
W81-02155 2E

Applications of the Compartmented Reservoir in Arizona,
W81-02265 4A

Genotype Evaluation and Moisture Requirements for Cultivated Jojoba,
W81-02266 3F

Barren Area Evapotranspiration Estimates Generated from Energy Budget Measurements in the Gila River Valley of Arizona,
W81-02387 2D

ARKANSAS
Engineering Planning and Evaluation of Potential Reservoir Sites.
W81-02151 6B

Discharge Data at Water-Quality Monitoring Stations in Arkansas, 1979 Water Year,
W81-02386 2E

ARKANSAS RIVER (CO)
Calibration and Potential Uses of a Digital Water-Quality Model for the Arkansas River in Pueblo County, Colorado,
W81-02395 5B

ARTIFICIAL RECHARGE
Computer-Model Analysis of the Use of Delaware River Water to Supplement Water From the Potomac-Raritan-Magothy Aquifer System in Southern New Jersey,
W81-02348 6A

Chemical and Microbiological Monitoring of a Sole-Source Aquifer Intended for Artifical Recharge, Nassau County, New York,
W81-02393 4B

ASH MEADOWS (NV)
Paleohydrology of the Southern Great Basin, with Special Reference to Water Table Fluctuations Beneath the Nevada Test Site During the Late( ) Pleistocene,
W81-02372 5E

ATTENUATION
Relationship Between Nephelometric Turbidity and Scattering Coefficients in Certain Australian Waters,
W81-02236 5A

AUSTRALIA
Degradation of the Herbicide 2,4-D in River Water - I. Description of Study Area and Survey of Rate Determing Factors,
W81-02152 5B

Relationships Between Forms of Nitrogen and Hydrological Characteristics in a Small Stream Near Adelaide, South Australia,
W81-02234 5B

AVAILABLE WATER
Integrated Assessment and Management of Water Quantity and Water Quality in the Merrimack River Basin, New Hampshire,
W81-02268 6A

BACTERIA
Growth Kinetics of Freshwater Bacterial Populations and Isolated Strains,
W81-02206 5C

Significance of Algal Extracellular Products to Bacteria in Lakes and in Cultures,
W81-02216 2H

Differential Filtration Studies of Carbon Flux from Living Algae to Microheterotrophs, Microplankton Size Distribution and Respiration in Lake Kinneret,
W81-02217 2H

Heterotrophic Microflora of the Reservoir at Lubachow. 2. Vertical Distribution of Bacteria Predominating in the Reservoir at Lubachow in the Annual Cycle,
W81-02247 5B

BANBURY HOT SPRINGS (ID)
Geothermal Resources in the Banbury Hot Springs Area, Twin Falls County, Idaho,
W81-02367 1A

BASE FLOW
Relationships Between Forms of Nitrogen and Hydrological Characteristics in a Small Stream Near Adelaide, South Australia,
W81-02234 5B

BED LOAD
Stochastic Estimation of Bed Load Yield in Pool-and-Riffle Mountain Streams,
W81-02207 2J

BEST MANAGEMENT PRACTICES
Cost-Effectiveness Factors for Urban Best Management Practices,
W81-02299 6A

Effectiveness of Best Management Practices in Controlling Nonpoint Pollution from Commercial Clearcuts,
W81-02300 4D

Benefit Taxation and Cost Sharing: Mechanisms for Encourgaging Acceptance of Nonpoint Pollution Control Strategies,
W81-02307 6C

The Statewide 208 Nonpoint Source Control Program for Virginia,
W81-02308 5G

BIALA PRZEMSZA RIVER
Hydrochemical Characteristics and Pollution of the River Biala Przemsza Catchment Basin,
W81-02245 5B

BIBLIOGRAPHIES
An Annotated Bibliography of Devices Developed for Direct Measurement of Seepage,
W81-02370 10C

BIOASSAY
A Bioassay Application for Quantitative Toxicity Measurements, Using the Green Algae Selenastrum Capricornutum,
W81-02194 5A

Availability and Plant Uptake of Heavy Metals From Contaminated Dredged Material Placed in Flooded and Upland Disposal Environments,
W81-02316 5A

BIODEGRADATION
Kinetic Study of the Biodegradation of Biphenyl and its Monochlorinated Analogues by a Mixed Marine Microbial Community,
W81-02199 5B

BIOINDICATORS
Use of an In Situ Artificial Substrate for Biological Accumulation and Monitoring of Aqueous Trace Metals--A Preliminary Field Investigation,
W81-02192 5A

A Bioassay Application for Quantitative Toxicity Measurements, Using the Green Algae Selenastrum Capricornutum,
W81-02194 5A

Ecological Studies of the Kelp, Laminaria Hyperborea, and its Associated Fauna in Southwest Ireland,
W81-02215 2L

Aquatic Macrophytes as Indicator for Heavy Metal Pollution in the River Leine (West Germany). (Makrophytische Wasserpflanzen Als Bioindikatoren Fur Die Schwermetall-Belastung Der Oberen Leine),
W81-02252 5A

BIOLOGICAL TREATMENT
Periodic Parameter Variation in a Full Scale Treatment Plant with Alternating Operation,
W81-02164 5D

The Design of Two Plants for Biological Removal of Nutrients,
W81-02175 5D

Hydraulic Losses in Biological Reactors with Circulating Flows,
W81-02176 5D

The New Industrial Waste Water Treatment Plant at the Chemical Works of DSM (Netherlands): Design and Practical Experience,
W81-02177 5D

Nonlinear Models of Biological Treatment Processes,
W81-02196 5D

BIOLOGICAL WASTE WATER TREATMENT
Intensified Biological Waste Water Treatment City of Frankfurt AM Main,
W81-02162 5D

Development Trends in Construction and Chemical Engineering of Biological Waste Water Treatment Plants, Taking Hoechstag as an Example,
W81-02168 5D

CALIFORNIA
Winning Design Satisfies Diverse Needs,
W81-02188 5D

Flexible System Saves Energy,
W81-02189 5D

An Exploratory Application of Entropy Minimax to Weather Prediction: Estimating the Likelihood of Multi-Year Droughts in California,
W81-02264 6A

Proposed Trinity River Basin Fish and Wildlife Management Program, Main Report, Final.
W81-02329 6G

Proposed Trinity River Basin Fish and Wildlife Management Program, Appendix A, Socioeconomic Analysis, Final.
W81-02330 6G

Proposed Trinity River Basin Fish and Wildlife Management Program, Appendix B, Sediment and Related Analysis, Final.
W81-02331 6G

Proposed Trinity River Basin Fish and Wildlife Management Program, Appendix C, Fish and Wildlife Analysis, Final, Volume 1.
W81-02332 6G

Proposed Trinity River Basin Fish and Wildlife Mangement Program, Appendix C, Fish and Wildlife Analysis, Final, Volume 2.
W81-02333 6G

Proposed Trinity River Basin Fish and Wildlife Management Program, Appendix D, Draft Report Comments and Responses, Final, Volume 1.
W81-02334 6G

Proposed Trinity River Basin Fish and Wildlife Management Program, Appendix D, Draft Report Comments and Responses, Final, Volume 2.
W81-02335 6G

Chemical Analyses for Selected Wells in San Joaquin County and Part of Contra Costa County, California,
W81-02343 7C

Irrigation Water Supply for the Coast Indian Community, Resighini Rancheria, Klamath, California,
W81-02352 6D

Groundwater-Level Monitoring for Earthquake Prediction--A Progress Report Based on Data Collected in Southern California, 1976-79,
W81-02382 2F

CANNERIES
Flexible System Saves Energy,
W81-02189 5D

CAPE COD (MA)
Cape Code Aquifer, Cape Cod, Massachusetts,
W81-02364 2F

CHANNEL IMPROVEMENT
Dredging on a Competitive Basis,
W81-02314 6B

The Salinity Effects of Deepening the Dredged Channels in the Chesapeake Bay,
W81-02326 2L

CHEMICAL ANALYSIS
Chemical Analyses for Selected Wells in San Joaquin County and Part of Contra Costa County, California,
W81-02343 7C

Chemical and Physical Characteristics of Natural Groundwaters in Michigan: A Preliminary Report,
W81-02345 2F

Chemical and Microbiological Monitoring of a Sole-Source Aquifer Intended for Artifical Recharge, Nassau County, New York,
W81-02393 4B

CHEMICAL OXYGEN DEMAND
Flow Injection Analysis Using Potassium Permanganate: An Approach for Measuring Chemical Oxygen Demand in Organic Wastes and Waters,
W81-02165 5A

The Oxygen Demand of Sewage,
W81-02237 5D

CHEMICAL PRECIPITATION
The Treatment of Mixed Industrial and Domestic Sewage Using Chemical and Biological Treatment at Davyhulme Advanced Waste Water Treatment Pilot Plant,
W81-02203 5D

Oxygen-rich Gas Domes of Microbial Origin in the Salt Crust of the Great Salt Lake, Utah,
W81-02310 5A

CHEMICAL WASTES
Odours Emitted by BASF AG's Activated Sludge Plant Treating Chemical Works Effluent in Ludwigshafen/Rhine,
W81-02169 5D

The New Industrial Waste Water Treatment Plant at the Chemical Works of DSM (Netherlands): Design and Practical Experience,
W81-02177 5D

CHESAPEAKE BAY
Quantification of Nutrient Loadings to the Chesapeake Bay: A Strategy,
W81-02284 5A

Nonpoint Sources and Impacts in a Small Coastal Plain Estuary: A Case Study of the Ware River Basin, Virginia,
W81-02286 5B

Evaluation of Nonpoint Source Sampling, Loading Rates, and Data Transferability for an Estuarine Drainage Basin of Chesapeake Bay,
W81-02287 5A

The Salinity Effects of Deepening the Dredged Channels in the Chesapeake Bay,
W81-02326 2L

CHICAGO
The Prairie Plan - The First Decade, The Second Decade - The United States' Largest Recycling System,
W81-02172 5E

CHINA
Estimation of Small-Watershed Peak Flows in China,
W81-02208 2E

CHLORINATION
Avoidance Response of Juvenile Chromis Punctipinnis to Chlorinated Seawater,
W81-02230 5C

CHLORINE
Chlorine Dynamics during Inactivation of Coliforms, Acid-Fast Bacteria and Yeasts,
W81-02186 5D

CHLOROBENZENES
Determination of Chlorobenzenes in Water by Capillary Gas Chromatography,
W81-02154 5A

CHLOROPHENOLS
Degradation of Chlorophenols in Soil, Sediment, and Water at Low Temperature,
W81-02193 5C

CHLOROPHYTA
A Bioassay Application for Quantitative Toxicity Measurements, Using the Green Algae Selenastrum Capricornutum,
W81-02194 5A

CHROMIUM
Granulometric Dependence of Chromium Accumulation in Estuarine Sediments in Maine,
W81-02157 2L

Long-term Effects of Chromium and Copper on the Rotating Biological Contactor,
W81-02269 5D

CIVIL ENGINEERING
Staff Review of Proposed Lock Haven Flood Protection Project.
W81-02339 6B

CLASSIFICATION
Eutrophication Parameters and Trophic State Indices in 30 Swedish Waste-Receiving Lakes,
W81-02223 5C

CLOSTRIDIUM
The Occurrence of Clostridium Botulinum in Raw-Water Storage Areas and Their Elimination in Water Treatment Plants,
W81-02191 5F

COAGULATION
Magnesium Coagulation of Oxidation Pond Effluent,
W81-02267 5D

COAL GASIFICATION
Evaluation of Treatment Technologies for Water Reuse in Coal Gasification,
W81-02262 5D

COAL MINING
Data from a Hydrologic Reconnaissance of the Beluga, Peters Creek, and Healy Coal Areas, Alaska,
W81-02385 5B

COASTAL PLAINS
Geohydrology and Digital-Simulation Model of the Farrington Aquifer in the Northern Coastal Plain of New Jersey,
W81-02398 2F

COASTAL WATERS
Kinetic Study of the Biodegradation of Biphenyl and its Monochlorinated Analogues by a Mixed Marine Microbial Community,
W81-02199 5B

COLD RESISTANCE
Genotype Evaluation and Moisture Requirements for Cultivated Jojoba,
W81-02266 3F

COLIFORMS
Chlorine Dynamics during Inactivation of Coliforms, Acid-Fast Bacteria and Yeasts,
W81-02186 5D

COLORADO
Balancing Public and Private Controls at the Suburban County Level,
W81-02304 4D

Hydrogeochemistry and Simulated Solute Transport, Piceance Basin, Northwestern Colorado,
W81-02366 5B

Water-Quality Characteristics of Selected Lakes and Reservoirs in Colorado,
W81-02378 2H

Reconnaissance of Groundwater in the Vicinity of Gunnison and Crested Butte, West-Central Colorado,
W81-02381 4B

Summary of Water-Quality Data For Selected Streams in Colorado,
W81-02394 7C

Calibration and Potential Uses of a Digital Water-Quality Model for the Arkansas River in Pueblo County, Colorado,
W81-02395 5B

COMPLEXATION
Comparison of Spectrofluorometry and Ion-Selective Electrode Potentiometry for Determination of Complexes between Fulvic Acid and Heavy-Metal Ions,
W81-02260 5A

COMPUTER MODELS
A Field-Scale Model for Nonpoint Source Pollution Evaluation,
W81-02290 5A

Modeling Dairy Farm Operator Response to Nonpoint Source Control Regulations,
W81-02291 5B

Building Water Quality Objectives into Conservation Planning Models,
W81-02293 4D

HSPF: A Comprehensive Package for Simulation of Watershed Hydrology and Water Quality,
W81-02294 6A

New Methodologies to Evaluate Best Management Practices,
W81-02296 6A

Econometric and Programming Tools for Evaluation of the Economic Impacts of Nonpoint Pollution,
W81-02306 6B

CONNECTICUT
A Methodology for Estimating the Loads and Impacts of Nonpoint Sources on Lake and Stream Water Quality,
W81-02295 6A

Hydrogeologic Data for South Central Connecticut,
W81-02356 7C

CONTRA COSTA COUNTY (CA)
Chemical Analyses for Selected Wells in San Joaquin County and Part of Contra Costa County, California,
W81-02343 7C

CONTROL
Control of Nitrification in the Oxygen Activated Sludge Process,
W81-02163 5D

CONTROL PROGRAMS
Nonpoint Pollution: Future Economic and Financial Issues,
W81-02305 6B

COPPER
Estimated Safe Zinc and Copper Levels for Chinook Salmon, Oncorhynchus Tshawytscha, in the Upper Sacramento River, California,
W81-02225 5C

Long-term Effects of Chromium and Copper on the Rotating Biological Contactor,
W81-02269 5D

CORN
Simulating the Water Requirements and Economic Feasibility of Corn in the Midwest,
W81-02273 3F

COST ANALYSIS
Cost-Effectiveness Factors for Urban Best Management Practices,
W81-02299 6A

COST-BENEFIT ANALYSIS
Strategies for Considering Point and Nonpoint Control Tradeoffs for the Upper Potomac Estuary,
W81-02301 5G

Nonpoint Pollution: Future Economic and Financial Issues,
W81-02305 6B

Benefit Taxation and Cost Sharing: Mechanisms for Encourgaging Acceptance of Nonpoint Pollution Control Strategies,
W81-02307 6C

COST SHARING
Benefit Taxation and Cost Sharing: Mechanisms for Encourgaging Acceptance of Nonpoint Pollution Control Strategies,
W81-02307 6C

COSTS
Dredging on a Competitive Basis,
W81-02314 6B

CRAYFISH
Mercury Accumulation in Biota of Thunder Creek, Saskatchewan,
W81-02228 5A

CROP RESPONSE
Genotype Evaluation and Moisture Requirements for Cultivated Jojoba,
W81-02266 3F

Simulating the Water Requirements and Economic Feasibility of Corn in the Midwest,
W81-02273 3F

DAIRY FARMS
Modeling Dairy Farm Operator Response to Nonpoint Source Control Regulations,
W81-02291 5B

DAMS
Dissolved Oxygen and Temperature Survey of the Lower Susquehanna River, August 9th and 10th, 1979,
W81-02338 5A

Staff Review of Proposed Lock Haven Flood Protection Project,
W81-02339 6B

DATA COLLECTIONS
Water-Quality Reconnaissance of the Pascagoula and Escatawpa Rivers, Jackson County, Mississippi-May 1974 to July 1978,
W81-02362 5B

Quality of Water in the Pearl River, Jackson to Byram, Mississippi, September 21-22, 1976,
W81-02392 7C

Summary of Water-Quality Data For Selected Streams in Colorado,
W81-02394 7C

DATA STORAGE AND RETRIEVAL
Identification Codes for Organizations Listed in Computerized Data Systems of the U.S. Geological Survey,
W81-02344 10D

Directory of Member Organizations of the National Water Data Exchange (NAWDEX),
W81-02389 10D

DELAWARE RIVER
Computer-Model Analysis of the Use of Delaware River Water to Supplement Water From the Potomac-Raritan-Magothy Aquifer System in Southern New Jersey,
W81-02348 6A

Report of the River Master of the Delaware River for the Period December 1, 1978--November 30, 1979,
W81-02373 4A

DEMINERALIZATION
Advanced Treatment of Aluminum Industry Effluent for Non-Potable Reuse,
W81-02263 5D

DEVILS HOLE AREA (NV)
Water-Resources Data Collected in the Devils Hole Area, Nye County, Nevada, 1977-78,
W81-02391 4B

DIEL MIGRATION
Vertical Migrations of Zooplankton in the Arctic: A Test of the Environmental Controls,
W81-02312 2H

DIFFUSION
Evaluation of Selected Processes Controlling Nitrogen Loss in a Flooded Soil,
W81-02212 2K

DIRECTORIES
Directory of Member Organizations of the National Water Data Exchange (NAWDEX),
W81-02389 10D

DISCHARGE (WATER)
Discharge Data at Water-Quality Monitoring Stations in Arkansas, 1979 Water Year,
W81-02386 2E

DISPERSION
A Reactor Network Model of the Passaic River,
W81-02195 5B

DISPOSAL
Disposal of Secondary Sludge in the Kraft Recovery System,
W81-02178 5E

DISSOLVED AIR FLOTATION
Operating Experiences with Dissolved Air Flotation on Various Raw Waters,
W81-02251 5F

DISSOLVED OXYGEN
Effect of Oxygen Reduction Rate and Constant Low Dissolved Oxygen Concentrations on Two Estuarine Fish,
W81-02185 5C

Dissolved Oxygen and Temperature Survey of the Lower Susquehanna River, August 9th and 10th, 1979,
W81-02338 5A

DIURNAL DISTRIBUTION
In Situ Measurement of the Settling Velocity of Organic Carbon Particles and 10 Species of Phytoplankton,
W81-02219 2H

Diurnal Fluctuations within a Littoral Plankton Community in Oligotrophic Lake Paajarvi, Southern Finland,
W81-02240 2H

DOMESTIC WASTES
Leachate Quality from Lysimeters Treating Domestic Sewage,
W81-02275 5D

DRAINAGE
Simple Method for Predicting Drainage from Field Plots,
W81-02211 2G

DRAINAGE AREAS
Drainage Areas of Selected Surface-Water Sites in Florida,
W81-02371 7C

DREDGING
Dredging on a Competitive Basis,
W81-02314 6B

Availability and Plant Uptake of Heavy Metals From Contaminated Dredged Material Placed in Flooded and Upland Disposal Environments,
W81-02316 5A

The Section 404 Dredge and Fill Program,
W81-02318 6E

Release, Distribution, and Impacts of Polychlorinated Biphenyls (PCB) Induced by Dredged Material Disposal Activities at a Deepwater Estuarine Site,
W81-02321 5B

Contaminant Mobility in Diked Containment Areas,
W81-02322 5B

Containment Area Design for Sedimentation of Fine-Grained Dredged Material,
W81-02324 8A

The Salinity Effects of Deepening the Dredged Channels in the Chesapeake Bay,
W81-02326 2L

Preliminary Simulated Tidal Flow and Circulation Patterns in Hillsborough Bay, Florida,
W81-02363 2L

DREDGING EQUIPMENT
Dredging on a Competitive Basis,
W81-02314 6B

DROUGHT
An Exploratory Application of Entropy Minimax to Weather Prediction: Estimating the Likelihood of Multi-Year Droughts in California,
W81-02264 6A

DYNAMICS
Dynamic-Wave Modeling of Storm Sewers with Surcharge.
W81-02270 8B

EARTHQUAKES
Groundwater-Level Monitoring for Earthquake Prediction--A Progress Report Based on Data Collected in Southern California, 1976-79,
W81-02382 2F

EASTERN SHORE
Nonpoint Pollution Data Collection Problems on Low Flat Coastal Topography,
W81-02285 5B

ECONOMIC ANALYSIS
Nonpoint Pollution: Future Economic and Financial Issues,
W81-02305 6B

ECONOMIC ASPECTS
Integrated Assessment and Management of Water Quantity and Water Quality in the Merrimack River Basin, New Hampshire,
W81-02268 6A

ECONOMIC FEASIBILITY
Simulating the Water Requirements and Economic Feasibility of Corn in the Midwest,
W81-02273 3F

ECONOMIC IMPACT
Econometric and Programming Tools for Evaluation of the Economic Impacts of Nonpoint Pollution,
W81-02306 6B

Proposed Trinity River Basin Fish and Wildlife Management Program, Appendix A, Socioeconomic Analysis, Final.
W81-02330 6G

ECOSYSTEMS
Resistance of Nutrient Cycling Systems to Perturbations of the Flow Rates,
W81-02258 7B

EFFICIENCIES
Strategies for Considering Point and Nonpoint Control Tradeoffs for the Upper Potomac Estuary,
W81-02301 5G

EFFLUENTS
Avoidance Response of Juvenile Chromis Punctipinnis to Chlorinated Seawater,
W81-02230 5C

ELECTRODES
Reliability of an Electrode and a Water Analysis Kit for Determination of Ammonia in Aquaculture Systems,
W81-02180 5A

ELECTRODIALYSIS
Advanced Treatment of Aluminum Industry Effluent for Non-Potable Reuse,
W81-02263 5D

ENERGY BUDGET
Barren Area Evapotranspiration Estimates Generated from Energy Budget Measurements in the Gila River Valley of Arizona,
W81-02387 2D

ENGINEERS ESTIMATES
Engineering Planning and Evaluation of Potential Reservoir Sites.
W81-02151 6B

ENGLAND
The Tertiary Treatment of Sewages,
W81-02238 5D

River Severn Supply Scheme - Development of Upton Intake Works,
W81-02257 8A

ENTISOLS
Leachate Quality from Lysimeters Treating Domestic Sewage,
W81-02275 5D

ENVIRONMENTAL CONTROLS
Vertical Migrations of Zooplankton in the Arctic: A Test of the Environmental Controls,
W81-02312 2H

ENVIRONMENTAL EFFECTS
Biology of the North Arm,
W81-02309 5C

Release, Distribution, and Impacts of Polychlorinated Biphenyls (PCB) Induced by Dredged Material Disposal Activities at a Deepwater Estuarine Site,
W81-02321 5B

Water-Resources Data Collected in the Devils Hole Area, Nye County, Nevada, 1977-78,
W81-02391 4B

ENVIRONMENTAL SANITATION
The United Nations International Drinking Water Supply and Sanitation Decade,
W81-02250 6E

EQUIPMENT
Flow Injection Analysis Using Potassium Permanganate: An Approach for Measuring Chemical Oxygen Demand in Organic Wastes and Waters,
W81-02165 5A

Heat-Powered Water Pump,
W81-02340 3F

EROSION CONTROL
Building Water Quality Objectives into Conservation Planning Models,
W81-02293 4D

Balancing Public and Private Controls at the Suburban County Level,
W81-02304 4D

ESTIMATING
Estimation of Background Loadings and Concentrations of Phosphorus for Lakes in the Puget Sound Region, Washington,
W81-02383 5A

ESTUARIES
Granulometric Dependence of Chromium Accumulation in Estuarine Sediments in Maine,
W81-02157 2L

Effect of Oxygen Reduction Rate and Constant Low Dissolved Oxygen Concentrations on Two Estuarine Fish,
W81-02185 5C

Environmental Study of the Tagus Estuary,
W81-02205 5C

Evaluation of Nonpoint Source Sampling, Loading Rates, and Data Transferability for an Estuarine Drainage Basin of Chesapeake Bay,
W81-02287 5A

Studies of Salinity Stratification in Southern Lake Pontchartrain Near the Inner Harbor Navigation Canal,
W81-02311 2L

Release, Distribution, and Impacts of Polychlorinated Biphenyls (PCB) Induced by Dredged Material Disposal Activities at a Deepwater Estuarine Site,
W81-02321 5B

The Salinity Effects of Deepening the Dredged Channels in the Chesapeake Bay,
W81-02326 2L

Water-Quality Reconnaissance of the Pascagoula and Escatawpa Rivers, Jackson County, Mississippi-May 1974 to July 1978,
W81-02362 5B

Preliminary Simulated Tidal Flow and Circulation Patterns in Hillsborough Bay, Florida,
W81-02363 2L

ESTUARINE ENVIRONMENT
Studies of Salinity Stratification in Southern Lake Pontchartrain Near the Inner Harbor Navigation Canal,
W81-02311 2L

EUROPE
Developments in EEC Water Policy,
W81-02256 6E

EUTROPHIC LAKES
A Dilution Model Applied to a System of Shallow Eutrophic Lakes After Diversion of Sewage Effluents,
W81-02231 5G

EUTROPHICATION
Physical Variability and Phytoplankton Communities: I. The Descriptive Limnology of Hamilton Harbour,
W81-02181 5C

The Composition and Ecology of Periphyton Communities in Freshwaters. I. The Influence of Host Type and External Environment on Community Composition,
W81-02182 5C

Phytoplankton Response to Sewage Reduction in Vattern, A Large Oligotrophic Lake in Central Sweden,
W81-02222 5C

Eutrophication Parameters and Trophic State Indices in 30 Swedish Waste-Receiving Lakes,
W81-02223 5C

Algal Assay Studies of Waste Water Polluted Lakes,
W81-02224 5A

A Dilution Model Applied to a System of Shallow Eutrophic Lakes After Diversion of Sewage Effluents,
W81-02231 5G

Anaerobic Metabolism of Particulate Organic Matter in the Sediments of a Hypereutrophic Lake,
W81-02241 2H

Quantification and Characterization of Sedimenting Particulate Organic Matter in a Shallow Hypereutrophic Lake,
W81-02242 2H

Release of Phosphorus from Lake Sediments,
W81-02320 5C

EVALUATION
Evaluation and Revision of Sediment and Erosion Control Programs in Urbanizing Areas for Nonpoint Source Management,
W81-02297 6B

EVAPORATION
Oxygen-rich Gas Domes of Microbial Origin in the Salt Crust of the Great Salt Lake, Utah,
W81-02310 5A

EVAPOTRANSPIRATION
Deficit, High-Frequency Irrigation of Sugarbeets With the Line Source Technique,
W81-02213 3F

Barren Area Evapotranspiration Estimates Generated from Energy Budget Measurements in the Gila River Valley of Arizona,
W81-02387 2D

FALLOUT
Concentrations of Pu-239,240, Cs-137, and Sr-90 in the Waters of the Laurentian Great Lakes, Comparison of 1973 and 1976 Values,
W81-02198 5B

FARM WASTES
A Local Rural Perspective on Nonpoint Pollution Control,
W81-02281 5G

Selection of Potentially Critical Areas for Agricultural Livestock Waste in Maryland,
W81-02303 6B

FEDERAL GOVERNMENT
Water Quality Management Planning: The State Perspective,
W81-02279 6E

FEDERAL JURISDICTION
Control of Toxics in the United States,
W81-02315 5G

FEDERAL PROJECT POLICY
National Perspectives on Nonpoint Pollution Control,
W81-02278 5G

FEDERAL REPUBLIC OF GERMANY
Odours Emitted by BASF AG's Activated Sludge Plant Treating Chemical Works Effluent in Ludwigshafen/Rhine,
W81-02169 5D

FERTILIZERS
The Prairie Plan - The First Decade, The Second Decade - The United States' Largest Recycling System,
W81-02172 5E

FILTERS
The Occurrence of Clostridium Botulinum in Raw-Water Storage Areas and Their Elimination in Water Treatment Plants,
W81-02191 5F

FINLAND
Diurnal Fluctuations within a Littoral Plankton Community in Oligotrophic Lake Paajarvi, Southern Finland,
W81-02240 2H

FISH
Mercury Accumulation in Biota of Thunder Creek, Saskatchewan,
W81-02228 5A

Effect of 20- to 30-Day Continuous Exposure of Treated Bleached Kraft Mill Effluent on Selected Freshwater Species,
W81-02232 5C

FISH BEHAVIOR
Avoidance Response of Juvenile Chromis Punctipinnis to Chlorinated Seawater,
W81-02230 5C

FISH FOOD
Sewage Sludge and Carrot Wastes as Supplementary Feed for the Common Carp Cyprinus Carpio,
W81-02239 3C

FISH MANAGEMENT
Proposed Trinity River Basin Fish and Wildlife Management Program, Summary Report, Final.
W81-02328 6G

Proposed Trinity River Basin Fish and Wildlife Management Program, Main Report, Final.
W81-02329 6G

Proposed Trinity River Basin Fish and Wildlife Management Program, Appendix A, Socioeconomic Analysis, Final.
W81-02330 6G

Proposed Trinity River Basin Fish and Wildlife Management Program, Appendix C, Fish and Wildlife Analysis, Final, Volume 1.
W81-02332 6G

Proposed Trinity River Basin Fish and Wildlife Mangement Program, Appendix C, Fish and Wildlife Analysis, Final, Volume 2.
W81-02333 6G

Proposed Trinity River Basin Fish and Wildlife Management Program, Appendix D, Draft Report Comments and Responses, Final, Volume 1
W81-02334 6G

Proposed Trinity River Basin Fish and Wildlife Management Program, Appendix D, Draft Report Comments and Responses, Final, Volume 2.
W81-02335 6G

FISHKILL
Effect of Oxygen Reduction Rate and Constant Low Dissolved Oxygen Concentrations on Two Estuarine Fish,
W81-02185 5C

Fish Kills Caused by Pollution in 1977; Eighteenth Report.
W81-02327 5C

FLEXIBILITY
Flexible System Saves Energy,
W81-02189 5D

FLOCCULATION
Magnesium Coagulation of Oxidation Pond Effluent,
W81-02267 5D

FLOOD FORECASTING
Technique for Estimating the Magnitude and Frequency of Floods in the Houston, Texas, Metropolitan Area,
W81-02347 6F

Flood Depth-Frequency Relations for Louisiana.
W81-02349 2E

FLOOD PLAINS
Flood Depth-Frequency Relations for Louisiana.
W81-02349 2E

FLOOD PROTECTION
Staff Review of Proposed Lock Haven Flood Protection Project.
W81-02339 6B

FLOODS
Flood of February 20, 1979, in Hilo, Kau, and Puna Districts, Island of Hawaii,
W81-02376 2E

FLORIDA
Water Resources Data for Florida, Water Year 1979--Volume 2A. South Florida Surface Water.
W81-02341 7C

Water Resources Data for Florida, Water Year 1979--Volume 2B. South Florida Groundwater.
W81-02342 7C

Hydrologic Monitoring Program in Eldridge-Wilde and East Lake Road Well-Field Areas, Pinellas and Hillsborough Counties, Florida, 1978,
W81-02350 7C

Preliminary Simulated Tidal Flow and Circulation Patterns in Hillsborough Bay, Florida,
W81-02363 2L

Drainage Areas of Selected Surface-Water Sites in Florida,
W81-02371 7C

FLORIDAN AQUIFER
Hydrologic Monitoring Program in Eldridge-Wilde and East Lake Road Well-Field Areas, Pinellas and Hillsborough Counties, Florida, 1978,
W81-02350 7C

FLOTATION
Operating Experiences with Dissolved Air Flotation on Various Raw Waters,
W81-02251 5F

15 Years Practical Experience with Dissolved Air Flotation (DAF),
W81-02255 5D

FLOW RATES
Resistance of Nutrient Cycling Systems to Perturbations of the Flow Rates,
W81-02258 7B

Discharge Data at Water-Quality Monitoring Stations in Arkansas, 1979 Water Year,
W81-02386 2E

FOOD CHAINS
Mercury Accumulation in Biota of Thunder Creek, Saskatchewan,
W81-02228 5A

FOOD PROCESSING INDUSTRY
Component Mix Meets Tough Standards,
W81-02187 5D

FORECASTING
An Exploratory Application of Entropy Minimax to Weather Prediction: Estimating the Likelihood of Multi-Year Droughts in California,
W81-02264 6A

HSPF: A Comprehensive Package for Simulation of Watershed Hydrology and Water Quality,
W81-02294 6A

Groundwater-Level Monitoring for Earthquake Prediction--A Progress Report Based on Data Collected in Southern California, 1976-79,
W81-02382 2F

FOREST MANAGEMENT
Effectiveness of Best Management Practices in Controlling Nonpoint Pollution from Commercial Clearcuts,
W81-02300 4D

FRAIN'S LAKE
The Dominating Higher Order Vertical Modes of the Internal Seiche in a Small Lake,
W81-02218 2H

FRANKFURT
Intensified Biological Waste Water Treatment City of Frankfurt AM Main,
W81-02162 5D

FREEZING
Ground Freezing Halts Sewer Collapse.
W81-02220 8H

FULVIC ACIDS
Comparison of Spectrofluorometry and Ion-Selective Electrode Potentiometry for Determination of Complexes between Fulvic Acid and Heavy-Metal Ions,
W81-02260 5A

GALLUP SANDSTONE (NM)
Aquifer Tests in the Gallup Sandstone Near Yah-Ta-Hey, New Mexico,
W81-02397 2F

GAS CHROMATOGRAPHY
Determination of Chlorobenzenes in Water by Capillary Gas Chromatography,
W81-02154 5A

GAS DOMES
Oxygen-rich Gas Domes of Microbial Origin in the Salt Crust of the Great Salt Lake, Utah,
W81-02310 5A

GEOHYDROLOGIC UNITS
Potentiometric Surface Map of Water in the Madison Group, Montana,
W81-02374 7C

GEOLOGIC FORMATIONS
Hydrogeology of the Town of North Hempstead, Nassau County, Long Island, New York,
W81-02357 2F

GEOLOGY
Groundwater Availability and Surficial Geology of the Royal, Upper Presumpscot, and Upper Saco River Basins, Maine,
W81-02380 2F

GEOTHERMAL STUDIES
Geothermal Resources in the Banbury Hot Springs Area, Twin Falls County, Idaho,
W81-02367 1A

GERMANY
On the Reduction of Odour Emissions by Covering Surface Aeration Tanks,
W81-02173 5D

GILA RIVER PHREATOPHYTE PROJECT
Barren Area Evapotranspiration Estimates Generated from Energy Budget Measurements in the Gila River Valley of Arizona,
W81-02387 2D

GOVERNMENTS
Developments in EEC Water Policy,
W81-02256 6E

GRANULES
Design and Economics of Powdered Activated Carbon in the Activated Sludge Process,
W81-02158 5D

GREAT BASIN
Paleohydrology of the Southern Great Basin, with Special Reference to Water Table Fluctuations Beneath the Nevada Test Site During the Late( ) Pleistocene,
W81-02372 5E

GREAT LAKES
Concentrations of Pu-239,240, Cs-137, and Sr-90 in the Waters of the Laurentian Great Lakes, Comparison of 1973 and 1976 Values,
W81-02198 5B

Airborne Organic Contaminants in the Great Lakes Ecosystem,
W81-02202 5B

GREAT SALT LAKE
Biology of the North Arm,
W81-02309 5C

Oxygen-rich Gas Domes of Microbial Origin in the Salt Crust of the Great Salt Lake, Utah,
W81-02310 5A

Water Budget and Water-Surface Fluctuations, Great Salt Lake, Utah,
W81-02361 2H

GROUNDWATER
Trace Organics in Groundwater,
W81-02201 5B

Poliovirus Interaction with Montmorillonite Clay: Electron Microscopy and Flocculation Studies,
W81-02271 5B

Poliovirus Type I Adsorption to Crushed Ottawa Sand at High Titres,
W81-02272 5B

Analytical Study of the Ogallala Aquifer in Hansford County, Texas, Projections of Saturated Thickness, Volume of Water in Storage, Pumpage Rates, Pumping Lifts, and Well Yields,
W81-02336 4B

Analytical Study of the Ogallala Aquifer in Ochiltree County, Texas, Projections of Saturated Thickness, Volume of Water in Storage, Pumpage Rates, Pumping Lifts, and Well Yields,
W81-02337 4B

Water Resources Data for Florida, Water Year 1979--Volume 2B. South Florida Groundwater.
W81-02342 7C

Chemical Analyses for Selected Wells in San Joaquin County and Part of Contra Costa County, California,
W81-02343 7C

Chemical and Physical Characteristics of Natural Groundwaters in Michigan: A Preliminary Report,
W81-02345 2F

Approximate Land-Surface Subsidence in the Houston-Galveston Region, Texas, 1906-78, 1943-78, and 1973-78,
W81-02355 7C

Principal Aquifers and Well Yields in Washington,
W81-02358 7C

Cape Code Aquifer, Cape Cod, Massachusetts,
W81-02364 2F

Hydrogeochemistry and Simulated Solute Transport, Piceance Basin, Northwestern Colorado,
W81-02366 5B

Potentiometric Surface Map of Water in the Madison Group, Montana,
W81-02374 7C

Groundwater Quality in North Idaho,
W81-02377 2F

Groundwater-Level Monitoring for Earthquake Prediction--A Progress Report Based on Data Collected in Southern California, 1976-79,
W81-02382 2F

Data from a Hydrologic Reconnaissance of the Beluga, Peters Creek, and Healy Coal Areas, Alaska,
W81-02385 5B

Saline Water at the Base of the Glacial-Outwash Aquifer Near Vincennes, Knox County, Indiana,
W81-02396 2F

Groundwater in the Piedmont Upland of Central Maryland,
W81-02400 2F

GROUNDWATER AVAILABILITY
Groundwater Availability and Surficial Geology of the Royal, Upper Presumpscot, and Upper Saco River Basins, Maine,
W81-02380 2F

Groundwater in the Piedmont Upland of Central Maryland,
W81-02400 2F

GROUNDWATER MOVEMENT
Is Transport in Porous Media Always Diffusive. A Counterexample,
W81-02209 2F

Hydraulic Characteristics of an Underdrained Irrigation Circle, Muskegon County Waste Water Disposal System, Michigan,
W81-02388 5B

GROUNDWATER RESOURCES
Annual Water-Resources Review, White Sands Missile Range, New Mexico, 1979,
W81-02353 2F

Hydrogeologic Data for South Central Connecticut,
W81-02356 7C

Groundwater Data, 1969-77, Vandenberg Air Force Base Area, Santa Barbara County, California,
W81-02359 7C

Summary Groundwater Resources of Centre County, Pennsylvania,
W81-02375 7C

Groundwater Availability and Surficial Geology of the Royal, Upper Presumpscot, and Upper Saco River Basins, Maine,
W81-02380 2F

Reconnaissance of Groundwater in the Vicinity of Gunnison and Crested Butte, West-Central Colorado,
W81-02381 4B

GROWTH RATES
Growth Kinetics of Freshwater Bacterial Populations and Isolated Strains,
W81-02206 5C

HABITAT IMPROVEMENT
Proposed Trinity River Basin Fish and Wildlife Management Program, Appendix D, Draft Report Comments and Responses, Final, Volume 1.
W81-02334 6G

Proposed Trinity River Basin Fish and Wildlife Management Program, Appendix D, Draft Report Comments and Responses, Final, Volume 2.
W81-02335 6G

HAMILTON HARBOUR
Physical Variability and Phytoplankton Communities: I. The Descriptive Limnology of Hamilton Harbour,
W81-02181 5C

HAWAII
Leachate Quality from Lysimeters Treating Domestic Sewage,
W81-02275 5D

Flood of February 20, 1979, in Hilo, Kau, and Puna Districts, Island of Hawaii,
W81-02376 2E

HEAD LOSS
Hydraulic Losses in Biological Reactors with Circulating Flows,
W81-02176 5D

HEAT BALANCE
Barren Area Evapotranspiration Estimates Generated from Energy Budget Measurements in the Gila River Valley of Arizona,
W81-02387 2D

HEAT PUMPS
Heat-Powered Water Pump,
W81-02340 3F

HEAVY METALS
Use of an In Situ Artificial Substrate for Biological Accumulation and Monitoring of Aqueous Trace Metals--A Preliminary Field Investigation,
W81-02192 5A

Hydrochemical Characteristics and Pollution of the River Biala Przemsza Catchment Basin,
W81-02245 5B

Aquatic Macrophytes as Indicator for Heavy Metal Pollution in the River Leine (West Germany). (Makrophytische Wasserpflanzen Als Bioindikatoren Fur Die Schwermetall-Belastung Der Oberen Leine),
W81-02252 5A

Availability and Plant Uptake of Heavy Metals From Contaminated Dredged Material Placed in Flooded and Upland Disposal Environments,
W81-02316 5A

HERBICIDES
Degradation of the Herbicide 2,4-D in River Water - I. Description of Study Area and Survey of Rate Determing Factors,
W81-02152 5B

Degradation of the Herbicide 2,4-D in River Water - II. The Role of Suspended Sediment, Nutrients and Water Temperature,
W81-02153 5B

HILLSBOROUGH BAY (FL)
Preliminary Simulated Tidal Flow and Circulation Patterns in Hillsborough Bay, Florida,
W81-02363 2L

HOUSTON
Control of Nitrification in the Oxygen Activated Sludge Process,
W81-02163 5D

HOUSTON (TX)
Technique for Estimating the Magnitude and Frequency of Floods in the Houston, Texas, Metropolitan Area,
W81-02347 6F

HOWARD COUNTY
Nonpoint Contributions from Agricultural Activities in the Maryland Piedmont,
W81-02288 5B

HUDSON RIVER
Distribution and Concentration of PCB in the Hudson River and Associated Management Problems,
W81-02317 6E

HYDRAULIC CONDUCTIVITY
Simple Method for Predicting Drainage from Field Plots,
W81-02211 2G

Hydraulic Characteristics of an Underdrained Irrigation Circle, Muskegon County Waste Water Disposal System, Michigan,
W81-02388 5B

Aquifer Tests in the Gallup Sandstone Near Yah-Ta-Hey, New Mexico,
W81-02397 2F

HYDROELECTRIC POWER
Dissolved Oxygen and Temperature Survey of the Lower Susquehanna River, August 9th and 10th, 1979,
W81-02338 5A

HYDROGEN PEROXIDE
Odour Control With Hydrogen Peroxide,
W81-02174 5D

HYDROGEOLOGY
Hydrogeology of the Town of North Hempstead, Nassau County, Long Island, New York,
W81-02357 2F

Summary Groundwater Resources of Centre County, Pennsylvania,
W81-02375 7C

Water-Resources Data Collected in the Devils Hole Area, Nye County, Nevada, 1977-78,
W81-02391 4B

Geohydrology and Digital-Simulation Model of the Farrington Aquifer in the Northern Coastal Plain of New Jersey,
W81-02398 2F

Groundwater in the Piedmont Upland of Central Maryland,
W81-02400 2F

HYDROGRAPHS
Evaluation of a Distributed Parameter and a Lumped Parameter Model for Use in Water Quality Modeling
W81-02292 7B

HYDROLOGIC BUDGET
Water Budget and Water-Surface Fluctuations, Great Salt Lake, Utah,
W81-02361 2H

HYDROLOGIC DATA
Water Resources Data for Florida, Water Year 1979--Volume 2A. South Florida Surface Water.
W81-02341 7C

Water Resources Data for Florida, Water Year 1979--Volume 2B. South Florida Groundwater.
W81-02342 7C

Hydrologic Monitoring Program in Eldridge-Wilde and East Lake Road Well-Field Areas, Pinellas and Hillsborough Counties, Florida, 1978,
W81-02350 7C

Hydrogeologic Data for South Central Connecticut,
W81-02356 7C

Directory of Member Organizations of the National Water Data Exchange (NAWDEX),
W81-02389 10D

ICE-BRINE SYSTEMS
Ground Freezing Halts Sewer Collapse.
W81-02220 8H

IDAHO
Geothermal Resources in the Banbury Hot Springs Area, Twin Falls County, Idaho,
W81-02367 1A

Groundwater Quality in North Idaho,
W81-02377 2F

INCEPTISOLS
Leachate Quality from Lysimeters Treating Domestic Sewage,
W81-02275 5D

INCINERATION
Disposal of Secondary Sludge in the Kraft Recovery System,
W81-02178 5E

INDIA
Irrigation Efficiency in Sugarcane,
W81-02243 3F

INDIAN RESERVATIONS
Water Resources of the Port Gamble Indian Reservation, Washington,
W81-02365 4B

INDIANA
Quality of Surface Water in the Coal-Mining Region, Southwestern Indiana, March and May 1979,
W81-02384 5B

Saline Water at the Base of the Glacial-Outwash Aquifer Near Vincennes, Knox County, Indiana,
W81-02396 2F

INDUSTRIAL WASTES
Thames Water Authority Riverside Waste Water Treatment Works - Trade Effluent Treatment Plant Operating Problems and Their Resolution,
W81-02167 5D

The Treatment of Mixed Industrial and Domestic Sewage Using Chemical and Biological Treatment at Davyhulme Advanced Waste Water Treatment Pilot Plant,
W81-02203 5D

Treatment of Combined Domestic and Industrial Waste Water in Garland, Texas,
W81-02204 5D

Effect of 20- to 30-Day Continuous Exposure of Treated Bleached Kraft Mill Effluent on Selected Freshwater Species,
W81-02232 5C

Hydrochemical Characteristics and Pollution of the River Biala Przemsza Catchment Basin,
W81-02245 5B

Advanced Treatment of Aluminum Industry Effluent for Non-Potable Reuse,
W81-02263 5D

INFILTRATION
Trace Organic Behavior in Soil Columns during Rapid Infiltration of Secondary Waste water,
W81-02190 5D

Simple Method for Predicting Drainage from Field Plots,
W81-02211 2G

INFORMATION EXCHANGE
Identification Codes for Organizations Listed in Computerized Data Systems of the U.S. Geological Survey,
W81-02344 10D

INSTRUMENTATION
A Sequencing Sediment Trap for Time-Series Studies of Fragile Particles,
W81-02244 5A

An Annotated Bibliography of Devices Developed for Direct Measurement of Seepage,
W81-02370 10C

INTAKES
River Severn Supply Scheme - Development of Upton Intake Works,
W81-02257 8A

INTERCEPTOR SEWERS
Ground Freezing Halts Sewer Collapse.
W81-02220 8H

INTERNATIONAL DRINKING WATER SUPPLY AND SANITATION DECADE
The United Nations International Drinking Water Supply and Sanitation Decade,
W81-02250 6E

INVERTEBRATES
Proposed Trinity River Basin Fish and Wildlife Mangement Program, Appendix C, Fish and Wildlife Analysis, Final, Volume 2.
W81-02333 6G

IRELAND
Ecological Studies of the Kelp, Laminaria Hyperborea, and its Associated Fauna in Southwest Ireland,
W81-02215 2L

IRRIGATION
Analytical Study of the Ogallala Aquifer in Hansford County, Texas, Projections of Saturated Thickness, Volume of Water in Storage, Pumpage Rates, Pumping Lifts, and Well Yields,
W81-02336 4B

IRRIGATION DESIGN
Simulating the Water Requirements and Economic Feasibility of Corn in the Midwest,
W81-02273 3F

IRRIGATION EFFECTS
Dependence of Dioscorea Tuber Growth Rate on Water Content of an Andept Soil,
W81-02214 2I

IRRIGATION EFFICIENCY
Deficit, High-Frequency Irrigation of Sugarbeets With the Line Source Technique,
W81-02213 3F

Irrigation Efficiency in Sugarcane,
W81-02243 3F

IRRIGATION PROGRAMS
Simulating the Water Requirements and Economic Feasibility of Corn in the Midwest,
W81-02273 3F

IRRIGATION WATER
Irrigation Water Supply for the Coast Indian Community, Resighini Rancheria, Klamath, California,
W81-02352 6D

IRRIGATION WELLS
Water-Resources Data Collected in the Devils Hole Area, Nye County, Nevada, 1977-78,

Trace Organics in Groundwater,
W81-02201 5B

Quality of Surface Water in the Coal-Mining Region, Southwestern Indiana, March and May 1979,
W81-02384 5B

PEAK DISCHARGE
Estimation of Small-Watershed Peak Flows in China,
W81-02208 2E

Technique for Estimating the Magnitude and Frequency of Floods in the Houston, Texas, Metropolitan Area,
W81-02347 6F

Flood Depth-Frequency Relations for Louisiana,
W81-02349 2E

Flood of February 20, 1979, in Hilo, Kau, and Puna Districts, Island of Hawaii,
W81-02376 2E

PEARL RIVER (MS)
Quality of Water in the Pearl River, Jackson to Byram, Mississippi, September 21-22, 1976,
W81-02392 7C

PENNSYLVANIA
Environmental Legislation and Nonpoint Pollution: The Pennsylvania Experience,
W81-02280 6E

The Public's Perspective on Nonpoint Sources,
W81-02283 5G

Building Water Quality Objectives into Conservation Planning Models,
W81-02293 4D

PENNSYLVANIA

Effectiveness of Best Management Practices in Controlling Nonpoint Pollution from Commercial Clearcuts.
W81-02300 4D

Dissolved Oxygen and Temperature Survey of the Lower Susquehanna River, August 9th and 10th, 1979.
W81-02338 5A

Staff Review of Proposed Lock Haven Flood Protection Project.
W81-02339 6B

Summary Groundwater Resources of Centre County, Pennsylvania.
W81-02375 7C

PERIPHYTON
The Composition and Ecology of Periphyton Communities in Freshwaters. I. The Influence of Host Type and External Environment on Community Composition.
W81-02182 5C

PERMEABILITY
Chlorine Dynamics during Inactivation of Coliforms, Acid-Fast Bacteria and Yeasts.
W81-02186 5D

PHENOLS
Degradation of Chlorophenols in Soil, Sediment, and Water at Low Temperature.
W81-02193 5C

PHILADELPHIA
Evaluation of Urban Stormwater Quality and Nonstructural Best Management Practices.
W81-02289 5B

PHOENIX
Trace Organic Behavior in Soil Columns during Rapid Infiltration of Secondary Waste water.
W81-02190 5D

PHOSPHORUS
Semiautomated Determination of Total Phosphorus and Total Kjeldahl Nitrogen in Surface Waters.
W81-02248 5A

Evaluation of Nonpoint Source Sampling, Loading Rates, and Data Transferability for an Estuarine Drainage Basin of Chesapeake Bay.
W81-02287 5A

Release of Phosphorus from Lake Sediments.
W81-02320 5C

Mathematical Model of Phosphorus Release from Lake Sediment.
W81-02323 5C

Estimation of Background Loadings and Concentrations of Phosphorus for Lakes in the Puget Sound Region, Washington.
W81-02383 5A

PHOSPHORUS COMPOUNDS
The Management of the Catchment Area of the Goczalkowice Reservoir and its Effect on the Amount of Nitrogen and Phosphorus Migration from it.
W81-02246 5B

PHYTOPLANKTON
Phytoplankton from Swedish Lakes. III. Lake Hundsjon and Other Kettle Lakes of Central Sweden.
W81-02184 2H

In Situ Measurement of the Settling Velocity of Organic Carbon Particles and 10 Species of Phytoplankton.
W81-02219 2H

Phytoplankton Response to Sewage Reduction in Vattern, A Large Oligotrophic Lake in Central Sweden.
W81-02222 5C

Spectral Absorption Properties of Natural Waters: Contribution of the Soluble and Particulate Fractions to Light Absorption in Some Inland Waters of South-Eastern Australia.
W81-02235 2H

Quantification and Characterization of Sedimenting Particulate Organic Matter in a Shallow Hypereutrophic Lake.
W81-02242 2H

PHYTOTOXICITY
Availability and Plant Uptake of Heavy Metals From Contaminated Dredged Material Placed in Flooded and Upland Disposal Environments.
W81-02316 5A

PICEANCE BASIN (CO)
Hydrogeochemistry and Simulated Solute Transport, Piceance Basin, Northwestern Colorado.
W81-02366 5B

PILOT PLANTS
Operating Experiences with Dissolved Air Flotation on Various Raw Waters.
W81-02251 5F

PIPES
Tetrachloroethylene Contamination of Drinking Water by Vinyl-Coated Asbestos-Cement Pipe.
W81-02233 5B

PLANKTON
Diurnal Fluctuations within a Littoral Plankton Community in Oligotrophic Lake Paajarvi, Southern Finland.
W81-02240 2H

PLANNING
Engineering Planning and Evaluation of Potential Reservoir Sites.
W81-02151 6B

PLANT GROWTH
Dependence of Dioscorea Tuber Growth Rate on Water Content of an Andept Soil.
W81-02214 2I

POLAND
Hydrochemical Characteristics and Pollution of the River Biala Przemsza Catchment Basin.
W81-02245 5B

The Management of the Catchment Area of the Goczalkowice Reservoir and its Effect on the Amount of Nitrogen and Phosphorus Migration from it.
W81-02246 5B

Heterotrophic Microflora of the Reservoir at Lubachow. 2. Vertical Distribution of Bacteria Predominating in the Reservoir at Lubachow in the Annual Cycle.
W81-02247 5B

POLLUTANT IDENTIFICATION
Determination of Chlorobenzenes in Water by Capillary Gas Chromatography.
W81-02154 5A

Factors to Consider in Organizing Sampling and Analyses for Priority Pollutants in Waste Waters.
W81-02179 5A

Reliability of an Electrode and a Water Analysis Kit for Determination of Ammonia in Aquaculture Systems.
W81-02180 5A

Use of an In Situ Artificial Substrate for Biological Accumulation and Monitoring of Aqueous Trace Metals--A Preliminary Field Investigation.
W81-02192 5A

Adhesion-Binding of 2,2',4,4',5'5'-Hexachlorobiphenyl to Glass and Plastic: A Possible Source of Error for PCB Analysis.
W81-02229 5A

Techniques for Virus Detection in the Marine Environment.
W81-02274 5A

POLLUTION CONTROL
Evaluation and Revision of Sediment and Erosion Control Programs in Urbanizing Areas for Nonpoint Source Management.
W81-02297 6B

POLYCHLORINATED BIPHENYLS
Efficiency and Rate of Elimination of Polychlorinatd Biphenyls from Waste Waters by Means of Algae.
W81-02227 5D

Adhesion-Binding of 2,2',4,4',5'5'-Hexachlorobiphenyl to Glass and Plastic: A Possible Source of Error for PCB Analysis.
W81-02229 5A

Distribution and Concentration of PCB in the Hudson River and Associated Management Problems.
W81-02317 6E

Release, Distribution, and Impacts of Polychlorinated Biphenyls (PCB) Induced by Dredged Material Disposal Activities at a Deepwater Estuarine Site.
W81-02321 5B

PORE PRESSURE
Estimating Critical Stress in Unsaturated Soils from Changes in Pore Water Pressure during Confined Compression.
W81-02210 2G

POROUS MEDIA
Is Transport in Porous Media Always Diffusive. A Counterexample.
W81-02209 2F

PORT GAMBLE INDIAN RESERVATION (WA)
Water Resources of the Port Gamble Indian Reservation, Washington.
W81-02365 4B

POTABLE WATER
Tetrachloroethylene Contamination of Drinking Water by Vinyl-Coated Asbestos-Cement Pipe.
W81-02233 5B

The United Nations International Drinking Water Supply and Sanitation Decade.
W81-02250 6E

POTENTIAL WATER SUPPLY
Irrigation Water Supply for the Coast Indian Community, Resighini Rancheria, Klamath, California.
W81-02352 6D

POTENTIOMETRIC LEVEL
Potentiometric Surface Map of Water in the Madison Group, Montana.
W81-02374 7C

POTOMAC RIVER
A Local Urban Perspective on Nonpoint Pollution Control.
W81-02282 5G

Strategies for Considering Point and Nonpoint Control Tradeoffs for the Upper Potomac Estuary.
W81-02301 5G

POTOMAC RIVER BASIN
Nonpoint Pollution Control -- Tools and Techniques for the Future. Proceedings of a Technical Symposium.
W81-02276 5G

POWERPLANTS
Avoidance Response of Juvenile Chromis Punctipinnis to Chlorinated Seawater,
W81-02230 5C

PREDATION
Reduced-Order Modelling of the Activated-Sludge Process,
W81-02197 5D

PREDICTIVE MODELING
Quantification of Nutrient Loadings to the Chesapeake Bay: A Strategy,
W81-02284 5A

PROGRAMS
Evaluation and Revision of Sediment and Erosion Control Programs in Urbanizing Areas for Nonpoint Source Management,
W81-02297 6B

PROJECT PLANNING
Environmental Study of the Tagus Estuary,
W81-02205 5C

Planning Report for the Southwest Alluvial Basins (East) Regional Aquifer-System Analysis, Parts of Colorado, New Mexico, and Texas,
W81-02360 6A

PROJECTS
Water-Resources Investigations of the U.S. Geological Survey in Missouri--Fiscal Year 1980.
W81-02379 7C

PUEBLO COUNTY (CO)
Calibration and Potential Uses of a Digital Water-Quality Model for the Arkansas River in Pueblo County, Colorado,
W81-02395 5B

PULP AND PAPER INDUSTRY
Factors to Consider in Organizing Sampling and Analyses for Priority Pollutants in Waste Waters,
W81-02179 5A

Effect of 20- to 30-Day Continuous Exposure of Treated Bleached Kraft Mill Effluent on Selected Freshwater Species,
W81-02232 5C

PULP WASTES
Disposal of Secondary Sludge in the Kraft Recovery System,
W81-02178 5E

Studies on the Toxicity of Pulp and Paper Mill Effluents - II. Mutagenicity of the Extracts of the Liver from Spotted Sea Trout (Nibea Mitsukurii),
W81-02183 5A

Effect of 20- to 30-Day Continuous Exposure of Treated Bleached Kraft Mill Effluent on Selected Freshwater Species,
W81-02232 5C

PUMPING
Annual Water-Resources Review, White Sands Missile Range, New Mexico, 1979,
W81-02353 2F

Water-Resources Data Collected in the Devils Hole Area, Nye County, Nevada, 1977-78,
W81-02391 4B

PUPFISH
Water-Resources Data Collected in the Devils Hole Area, Nye County, Nevada, 1977-78,
W81-02391 4B

RADIOACTIVE WASTE DISPOSAL
Paleohydrology of the Southern Great Basin, with Special Reference to Water Table Fluctuations Beneath the Nevada Test Site During the Late( ) Pleistocene,
W81-02372 5E

RADIOISOTOPES
Concentrations of Pu-239,240, Cs-137, and Sr-90 in the Waters of the Laurentian Great Lakes, Comparison of 1973 and 1976 Values,
W81-02198 5B

RAINFALL-RUNOFF RELATIONSHIPS
Runoff Calculation on Semi-Arid Watersheds Using a Rotadisk Rainulator,
W81-02155 2E

Nonpoint Contributions from Agricultural Activities in the Maryland Piedmont,
W81-02288 5B

Hydrologic Data for Urban Studies in the San Antonio, Texas Metropolitan Area, 1977,
W81-02390 4C

RAW WATER
The Occurrence of Clostridium Botulinum in Raw-Water Storage Areas and Their Elimination in Water Treatment Plants,
W81-02191 5F

RECHARGE
Analytical Study of the Ogallala Aquifer in Hansford County, Texas, Projections of Saturated Thickness, Volume of Water in Storage, Pumpage Rates, Pumping Lifts, and Well Yields,
W81-02336 4B

Analytical Study of the Ogallala Aquifer in Ochiltree County, Texas, Projections of Saturated Thickness, Volume of Water in Storage, Pumpage Rates, Pumping Lifts, and Well Yields,
W81-02337 4B

RECLAIMED WATER
Poliovirus Type I Adsorption to Crushed Ottawa Sand at High Titres,
W81-02272 5B

Chemical and Microbiological Monitoring of a Sole-Source Aquifer Intended for Artifical Recharge, Nassau County, New York,
W81-02393 4B

RECREATION FACILITIES
Playground and WTP are Good Neighbors,
W81-02261 5F

RECYCLING
Sewage Sludge and Carrot Wastes as Supplementary Feed for the Common Carp Cyprinus Carpio,
W81-02239 3C

Advanced Treatment of Aluminum Industry Effluent for Non-Potable Reuse,
W81-02263 5D

REFLECTANCE
Predictability of Change in Soil Reflectance on Wetting,
W81-02313 7B

REGIONAL ANALYSIS
Flood Depth-Frequency Relations for Louisiana,
W81-02349 2E

Planning Report for the Southwest Alluvial Basins (East) Regional Aquifer-System Analysis, Parts of Colorado, New Mexico, and Texas,
W81-02360 6A

REGIONAL FLOOD
Staff Review of Proposed Lock Haven Flood Protection Project.
W81-02339 6B

REGRESSION ANALYSIS
Low-Flow Characteristics of Streams in the St. Croix River Basin, Wisconsin,
W81-02368 2E

Low-Flow Characteristics of Streams in the Menominee-Oconto-Peshtigo River Basin, Wisconsin,
W81-02369 2E

REGULATION
Developments in EEC Water Policy,
W81-02256 6E

REMOTE SENSING
Predictability of Change in Soil Reflectance on Wetting,
W81-02313 7B

RESEARCH PRIORITIES
Nonpoint Pollution Control from the Standpoint of Research,
W81-02277 5G

National Perspectives on Nonpoint Pollution Control,
W81-02278 5G

RESERVOIR DESIGN
Applications of the Compartmented Reservoir in Arizona,
W81-02265 4A

RESERVOIR EVAPORATION
Multiple Objectives in Reservoir Operation,
W81-02156 3B

RESERVOIR OPERATION
Multiple Objectives in Reservoir Operation,
W81-02156 3B

Report of the River Master of the Delaware River for the Period December 1, 1978--November 30, 1979,
W81-02373 4A

RESERVOIR RELEASES
Multiple Objectives in Reservoir Operation,
W81-02156 3B

Report of the River Master of the Delaware River for the Period December 1, 1978--November 30, 1979,
W81-02373 4A

RESERVOIR SITES
Engineering Planning and Evaluation of Potential Reservoir Sites.
W81-02151 6B

RESERVOIR STORAGE
Report of the River Master of the Delaware River for the Period December 1, 1978--November 30, 1979,
W81-02373 4A

RESERVOIRS
The Management of the Catchment Area of the Goczalkowice Reservoir and its Effect on the Amount of Nitrogen and Phosphorus Migration from it,
W81-02246 5B

Heterotrophic Microflora of the Reservoir at Lubachow. 2. Vertical Distribution of Bacteria Predominating in the Reservoir at Lubachow in the Annual Cycle.
W81-02247 5B

Limnological Data for 12 Reservoirs in Valley County, Montana,
W81-02351 2H

Water-Quality Characteristics of Selected Lakes and Reservoirs in Colorado.
W81-02378 2H

RESIGHINI RANCHERIA (CA)
Irrigation Water Supply for the Coast Indian Community, Resighini Rancheria, Klamath, California,
W81-02352 6D

RESONANCE
The Dominating Higher Order Vertical Modes of the Internal Seiche in a Small Lake,
W81-02218 2H

REVERSE OSMOSIS
Advanced Treatment of Aluminum Industry Effluent for Non-Potable Reuse,
W81-02263 5D

RIO GRANDE
Planning Report for the Southwest Alluvial Basins (East) Regional Aquifer-System Analysis, Parts of Colorado, New Mexico, and Texas,
W81-02360 6A

RIVER BASIN DEVELOPMENT
Proposed Trinity River Basin Fish and Wildlife Management Program, Summary Report, Final.
W81-02328 6G

Proposed Trinity River Basin Fish and Wildlife Management Program, Main Report, Final.
W81-02329 6G

Proposed Trinity River Basin Fish and Wildlife Management Program, Appendix A, Socioeconomic Analysis, Final.
W81-02330 6G

Proposed Trinity River Basin Fish and Wildlife Management Program, Appendix B, Sediment and Related Analysis, Final.
W81-02331 6G

RIVER BEDS
Distribution and Concentration of PCB in the Hudson River and Associated Management Problems,
W81-02317 6E

RIVER FLOW
Proposed Trinity River Basin Fish and Wildlife Management Program, Main Report, Final.
W81-02329 6G

RIVERS
A Reactor Network Model of the Passaic River,
W81-02195 5B

Dissolved Oxygen and Temperature Survey of the Lower Susquehanna River, August 9th and 10th, 1979,
W81-02338 5A

Summary of Water-Quality Data For Selected Streams in Colorado,
W81-02394 7C

Calibration and Potential Uses of a Digital Water-Quality Model for the Arkansas River in Pueblo County, Colorado,
W81-02395 5B

ROOT ZONE
Root Zone Nitrogen Simulation Model for Land Application of Sewage Sludges,
W81-02259 5E

ROTATIONAL FLOW
Hydraulic Losses in Biological Reactors with Circulating Flows,
W81-02176 5D

RUNNING WATERS
Comparative Study of Physical-Chemical Variables of Streams Using Multivariate Analyses,
W81-02253 2E

RUNOFF
The Management of the Catchment Area of the Goczalkowice Reservoir and its Effect on the Amount of Nitrogen and Phosphorus Migration from it,
W81-02246 5B

RUNOFF FORECASTING
Runoff Calculation on Semi-Arid Watersheds Using a Rotadisk Rainulator,
W81-02155 2E

SACRAMENTO RIVER
Estimated Safe Zinc and Copper Levels for Chinook Salmon, Oncorhynchus Tshawytscha, in the Upper Sacramento River, California,
W81-02225 5C

SALINE LAKES
Biology of the North Arm,
W81-02309 5C

SALINE WATER
Saline Water at the Base of the Glacial-Outwash Aquifer Near Vincennes, Knox County, Indiana,
W81-02396 2F

SALINE WATER-FRESHWATER INTERFACE
Hydrologic Monitoring Program in Eldridge-Wilde and East Lake Road Well-Field Areas, Pinellas and Hillsborough Counties, Florida, 1978,
W81-02350 7C

SALINITY
Studies of Salinity Stratification in Southern Lake Pontchartrain Near the Inner Harbor Navigation Canal,
W81-02311 2L

The Salinity Effects of Deepening the Dredged Channels in the Chesapeake Bay,
W81-02326 2L

SALMON
Estimated Safe Zinc and Copper Levels for Chinook Salmon, Oncorhynchus Tshawytscha, in the Upper Sacramento River, California,
W81-02225 5C

SAMPLING
Factors to Consider in Organizing Sampling and Analyses for Priority Pollutants in Waste Waters,
W81-02179 5A

A Sequencing Sediment Trap for Time-Series Studies of Fragile Particles,
W81-02244 5A

Sampling, Preservation, and Analysis of Sediment Samples: State-of-the-Art Limitations,
W81-02325 7A

SAN ANTONIO VALLEY (CA)
Groundwater Data, 1969-77, Vandenberg Air Force Base Area, Santa Barbara County, California,
W81-02359 7C

SAN JOAQUIN COUNTY (CA)
Chemical Analyses for Selected Wells in San Joaquin County and Part of Contra Costa County, California,
W81-02343 7C

SAN JOAQUIN VALLEY (CA)
Chemical Analyses for Selected Wells in San Joaquin County and Part of Contra Costa County, California,
W81-02343 7C

SANTA BARBARA COUNTY (CA)
Groundwater Data, 1969-77, Vandenberg Air Force Base Area, Santa Barbara County, California,
W81-02359 7C

SASKATCHEWAN
Mercury Accumulation in Biota of Thunder Creek, Saskatchewan,
W81-02228 5A

SATURATED SOILS
Evaluation of Selected Processes Controlling Nitrogen Loss in a Flooded Soil,
W81-02212 2K

SCATTERING COEFFICIENT
Relationship Between Nephelometric Turbidity and Scattering Coefficients in Certain Australian Waters,
W81-02236 5A

SEAWATER
Techniques for Virus Detection in the Marine Environment,
W81-02274 5A

SEDIMENT CONTROL
Sediment Problems and Lake Restoration in Wisconsin,
W81-02319 5G

Proposed Trinity River Basin Fish and Wildlife Management Program, Appendix B, Sediment and Related Analysis, Final
W81-02331 6G

SEDIMENT TRANSPORT
Stochastic Estimation of Bed Load Yield in Pool-and-Riffle Mountain Streams,
W81-02207 2J

A Sequencing Sediment Trap for Time-Series Studies of Fragile Particles,
W81-02244 5A

SEDIMENT-WATER INTERFACES
Role of Benthic Algae in Transport of Nitrogen from Sediment to Lake Water in a Shallow Clearwater Lake,
W81-02221 2H

SEDIMENT YIELD
Proposed Trinity River Basin Fish and Wildlife Management Program, Appendix B, Sediment and Related Analysis, Final.
W81-02331 6G

SEDIMENTATION
Behavior of Radium and Barium in a System Including Uranium Mine Waste Waters and Adjacent Surface Waters,
W81-02200 5B

Magnesium Coagulation of Oxidation Pond Effluent,
W81-02267 5D

SEDIMENTOLOGY
A Sequencing Sediment Trap for Time-Series Studies of Fragile Particles,
W81-02244 5A

SEDIMENTS
Granulometric Dependence of Chromium Accumulation in Estuarine Sediments in Maine,
W81-02157 2L

Techniques for Virus Detection in the Marine Environment,
W81-02274 5A

Dredging on a Competitive Basis,
W81-02314 6B

Availability and Plant Uptake of Heavy Metals From Contaminated Dredged Material Placed in Flooded and Upland Disposal Environments,
W81-02316 5A

Distribution and Concentration of PCB in the Hudson River and Associated Management Problems.
W81-02317 6E

Release, Distribution, and Impacts of Polychlorinated Biphenyls (PCB) Induced by Dredged Material Disposal Activities at a Deepwater Estuarine Site.
W81-02321 5B

Containment Area Design for Sedimentation of Fine-Grained Dredged Material,
W81-02324 8A

Sampling, Preservation, and Analysis of Sediment Samples: State-of-the-Art Limitations,
W81-02325 7A

SEEPAGE
An Annotated Bibliography of Devices Developed for Direct Measurement of Seepage,
W81-02370 10C

SEICHES
The Dominating Higher Order Vertical Modes of the Internal Seiche in a Small Lake,
W81-02218 2H

SETTLING BASINS
Development Trends in Construction and Chemical Engineering of Biological Waste Water Treatment Plants, Taking Hoechstag as an Example,
W81-02168 5D

Contaminant Mobility in Diked Containment Areas,
W81-02322 5B

Containment Area Design for Sedimentation of Fine-Grained Dredged Material,
W81-02324 8A

SETTLING VELOCITY
In Situ Measurement of the Settling Velocity of Organic Carbon Particles and 10 Species of Phytoplankton,
W81-02219 2H

SEVERN RIVER
River Severn Supply Scheme - Development of Upton Intake Works,
W81-02257 8A

SEVERN TRENT WATERWAY
River Severn Supply Scheme - Development of Upton Intake Works.
W81-02257 8A

SEWAGE
Fate of Petroleum Hydrocarbons in Sewage Sludge After Land Disposal,
W81-02226 5E

SEWAGE DISPOSAL
Leachate Quality from Lysimeters Treating Domestic Sewage.
W81-02275 5D

SEWAGE EFFLUENTS
A Dilution Model Applied to a System of Shallow Eutrophic Lakes After Diversion of Sewage Effluents,
W81-02231 5G

SEWAGE SLUDGE
Root Zone Nitrogen Simulation Model for Land Application of Sewage Sludges,
W81-02259 5E

SEWAGE TREATMENT
The Oxygen Demand of Sewage,
W81-02237 5D

The Tertiary Treatment of Sewages,
W81-02238 5D

Leachate Quality from Lysimeters Treating Domestic Sewage,
W81-02275 5D

SEWER REPAIRS
Ground Freezing Halts Sewer Collapse.
W81-02220 8H

SEWERS
Odors and Their Control in Sewers and Treatment Facilities,
W81-02166 5D

Dynamic-Wave Modeling of Storm Sewers with Surcharge.
W81-02270 8B

SIMULATION MODEL
Simulating the Water Requirements and Economic Feasibility of Corn in the Midwest,
W81-02273 3F

SITES
Engineering Planning and Evaluation of Potential Reservoir Sites.
W81-02151 6B

SLUDGE
Fate of Petroleum Hydrocarbons in Sewage Sludge After Land Disposal,
W81-02226 5E

SLUDGE DISPOSAL
Trends in Liquid Sludge Management in the Niers Region,
W81-02161 5E

The Treatment of Industrial Waste Water Sludge from a Biological Purification Plant with Complete N-Removal,
W81-02170 5E

Sludge Disposal Practices in Thames Water Authority,
W81-02171 5E

The Prairie Plan - The First Decade, The Second Decade - The United States' Largest Recycling System,
W81-02172 5E

Disposal of Secondary Sludge in the Kraft Recovery System,
W81-02178 5E

Sewage Sludge and Carrot Wastes as Supplementary Feed for the Common Carp Cyprinus Carpio,
W81-02239 3C

SLUDGE TREATMENT
Trends in Liquid Sludge Management in the Niers Region,
W81-02161 5E

The Treatment of Industrial Waste Water Sludge from a Biological Purification Plant with Complete N-Removal,
W81-02170 5E

Sludge Disposal Practices in Thames Water Authority,
W81-02171 5E

Odour Control With Hydrogen Peroxide,
W81-02174 5D

SMALL WATERSHEDS
Quality of Runoff from Small Watersheds in the Twin Cities Metropolitan Area, Minnesota--A Project Plan,
W81-02354 5B

SOCIAL IMPACT
Proposed Trinity River Basin Fish and Wildlife Management Program, Appendix A, Socioeconomic Analysis, Final.
W81-02330 6G

SODIUM CHLORIDE
Oxygen-rich Gas Domes of Microbial Origin in the Salt Crust of the Great Salt Lake, Utah,
W81-02310 5A

SOIL CONTAMINATION
Availability and Plant Uptake of Heavy Metals From Contaminated Dredged Material Placed in Flooded and Upland Disposal Environments,
W81-02316 5A

SOIL DISPOSAL FIELDS
Trends in Liquid Sludge Management in the Niers Region,
W81-02161 5E

Sludge Disposal Practices in Thames Water Authority,
W81-02171 5E

The Prairie Plan - The First Decade, The Second Decade - The United States' Largest Recycling System,
W81-02172 5E

Fate of Petroleum Hydrocarbons in Sewage Sludge After Land Disposal,
W81-02226 5E

SOIL MOISTURE
Predictability of Change in Soil Reflectance on Wetting,
W81-02313 7B

SOIL PHYSICAL PROPERTIES
Estimating Critical Stress in Unsaturated Soils from Changes in Pore Water Pressure during Confined Compression,
W81-02210 2G

SOIL PROPERTIES
Poliovirus Interaction with Montmorillonite Clay: Electron Microscopy and Flocculation Studies,
W81-02271 5B

Poliovirus Type I Adsorption to Crushed Ottawa Sand at High Titres,
W81-02272 5B

SOIL WATER
Dependence of Dioscorea Tuber Growth Rate on Water Content of an Andept Soil,
W81-02214 2I

SOIL WATER MOVEMENT
Simple Method for Predicting Drainage from Field Plots,
W81-02211 2G

SOIL-WATER-PLANT RELATIONSHIPS
Dependence of Dioscorea Tuber Growth Rate on Water Content of an Andept Soil,
W81-02214 2I

SOLUTES
Is Transport in Porous Media Always Diffusive. A Counterexample,
W81-02209 2F

SORPTION
Trace Organic Behavior in Soil Columns during Rapid Infiltration of Secondary Waste water,
W81-02190 5D

SOUTH-CENTRAL CONNECTICUT
Hydrogeologic Data for South Central Connecticut,
W81-02356 7C

SOUTH FLORIDA
Water Resources Data for Florida, Water Year 1979--Volume 2A. South Florida Surface Water.
W81-02341 7C

SOUTH FLORIDA

Water Resources Data for Florida, Water Year 1979--Volume 2B. South Florida Groundwater. W81-02342 7C

SPOT
Effect of Oxygen Reduction Rate and Constant Low Dissolved Oxygen Concentrations on Two Estuarine Fish, W81-02185 5C

SPRINKLER IRRIGATION
Hydraulic Characteristics of an Underdrained Irrigation Circle, Muskegon County Waste Water Disposal System, Michigan, W81-02388 5B

ST. CROIX RIVER BASIN (WI)
Low-Flow Characteristics of Streams in the St. Croix River Basin, Wisconsin, W81-02368 2E

STATE GOVERNMENTS
Water Quality Management Planning: The State Perspective, W81-02279 6E

STOCHASTIC PROCESSES
Stochastic Estimation of Bed Load Yield in Pool-and-Riffle Mountain Streams, W81-02207 2J

STORAGE COEFFICIENT
Aquifer Tests in the Gallup Sandstone Near Yah-Ta-Hey, New Mexico, W81-02397 2F

STORM DRAINS
Dynamic-Wave Modeling of Storm Sewers with Surcharge. W81-02270 8B

STORM RUNOFF
Nonpoint Sources and Impacts in a Small Coastal Plain Estuary: A Case Study of the Ware River Basin, Virginia, W81-02286 5B

Evaluation of Urban Stormwater Quality and Nonstructural Best Management Practices. W81-02289 5B

Quality of Runoff from Small Watersheds in the Twin Cities Metropolitan Area, Minnesota--A Project Plan, W81-02354 5B

Flood of February 20, 1979, in Hilo, Kau, and Puna Districts, Island of Hawaii, W81-02376 2E

Hydrologic Data for Urban Studies in the San Antonio, Texas Metropolitan Area, 1977, W81-02390 4C

STORM SEWERS
Dynamic-Wave Modeling of Storm Sewers with Surcharge. W81-02270 8B

STRATIFICATION
Studies of Salinity Stratification in Southern Lake Pontchartrain Near the Inner Harbor Navigation Canal, W81-02311 2L

STREAM CLASSIFICATION
Comparative Study of Physical-Chemical Variables of Streams Using Multivariate Analyses, W81-02253 2E

STREAMFLOW
Relationships Between Forms of Nitrogen and Hydrological Characteristics in a Small Stream Near Adelaide, South Australia, W81-02234 5B

Low-Flow Characteristics of Streams in the St. Croix River Basin, Wisconsin, W81-02368 2E

Low-Flow Characteristics of Streams in the Menominee-Oconto-Peshtigo River Basin, Wisconsin, W81-02369 2E

Water-Resources Investigations of the U.S. Geological Survey in Missouri--Fiscal Year 1980, W81-02379 7C

Data from a Hydrologic Reconnaissance of the Beluga, Peters Creek, and Healy Coal Areas, Alaska, W81-02385 5B

Discharge Data at Water-Quality Monitoring Stations in Arkansas, 1979 Water Year, W81-02386 2E

Quality of Water in the Pearl River, Jackson to Byram, Mississippi, September 21-22, 1976, W81-02392 7C

STREAMFLOW FORECASTING
Estimation of Small-Watershed Peak Flows in China, W81-02208 2E

Low-Flow Characteristics of Streams in the St. Croix River Basin, Wisconsin, W81-02368 2E

Low-Flow Characteristics of Streams in the Menominee-Oconto-Peshtigo River Basin, Wisconsin, W81-02369 2E

STREAMS
Stochastic Estimation of Bed Load Yield in Pool-and-Riffle Mountain Streams, W81-02207 2J

Drainage Areas of Selected Surface-Water Sites in Florida, W81-02371 7C

STRESS
Estimating Critical Stress in Unsaturated Soils from Changes in Pore Water Pressure during Confined Compression, W81-02210 2G

STRIP MINES
Quality of Surface Water in the Coal-Mining Region, Southwestern Indiana, March and May 1979, W81-02384 5B

SUGAR BEETS
Deficit, High-Frequency Irrigation of Sugarbeets With the Line Source Technique, W81-02213 3F

SUGARCANE
Irrigation Efficiency in Sugarcane, W81-02243 3F

SULFIDES
Odour Control With Hydrogen Peroxide. W81-02174 5D

SUPPLEMENTARY FISH FOOD
Sewage Sludge and Carrot Wastes as Supplementary Feed for the Common Carp Cyprinus Carpio, W81-02239 3C

SURFACE RUNOFF
Nonpoint Pollution Data Collection Problems on Low Flat Coastal Topography, W81-02285 5B

SURFACE WATERS
Water Resources Data for Florida, Water Year 1979--Volume 2A. South Florida Surface Water. W81-02341 7C

Drainage Areas of Selected Surface-Water Sites in Florida, W81-02371 7C

Quality of Surface Water in the Coal-Mining Region, Southwestern Indiana, March and May 1979, W81-02384 5B

SUSPENDED SOLIDS
Contaminant Mobility in Diked Containment Areas, W81-02322 5B

SUSQUEHANA RIVER
Dissolved Oxygen and Temperature Survey of the Lower Susquehanna River, August 9th and 10th, 1979, W81-02338 5A

SWEDEN
Phytoplankton from Swedish Lakes. III. Lake Hundsjon and Other Kettle Lakes of Central Sweden, W81-02184 2H

Role of Benthic Algae in Transport of Nitrogen from Sediment to Lake Water in a Shallow Clearwater Lake, W81-02221 2H

Phytoplankton Response to Sewage Reduction in Vattern, A Large Oligotrophic Lake in Central Sweden, W81-02222 5C

Eutrophication Parameters and Trophic State Indices in 30 Swedish Waste-Receiving Lakes, W81-02223 5C

Algal Assay Studies of Waste Water Polluted Lakes, W81-02224 5A

A Dilution Model Applied to a System of Shallow Eutrophic Lakes After Diversion of Sewage Effluents, W81-02231 5G

TAGUS ESTUARY
Environmental Study of the Tagus Estuary, W81-02205 5C

TEMPERATURE
Degradation of the Herbicide 2,4-D in River Water - II. The Role of Suspended Sediment, Nutrients and Water Temperature, W81-02153 5B

TERTIARY TREATMENT
The Tertiary Treatment of Sewages, W81-02238 5D

15 Years Practical Experience with Dissolved Air Flotation (DAF), W81-02255 5D

TESTING PROCEDURES
Sampling, Preservation, and Analysis of Sediment Samples: State-of-the-Art Limitations, W81-02325 7A

TETRACHLOROETHYLENE
Tetrachloroethylene Contamination of Drinking Water by Vinyl-Coated Asbestos-Cement Pipe, W81-02233 5B

TEXAS
Analytical Study of the Ogallala Aquifer in Hansford County, Texas, Projections of Saturated Thickness, Volume of Water in Storage, Pumpage Rates, Pumping Lifts, and Well Yields, W81-02336 4B

Analytical Study of the Ogallala Aquifer in Ochiltree County, Texas, Projections of Saturated Thickness, Volume of Water in Storage, Pumpage Rates, Pumping Lifts, and Well Yields, W81-02337 4B

Approximate Land-Surface Subsidence in the Houston-Galveston Region, Texas, 1906-78, 1943-78, and 1973-78,
W81-02355 7C

Hydrologic Data for Urban Studies in the San Antonio, Texas Metropolitan Area, 1977,
W81-02390 4C

THAMES RIVER
Experience in Operating the Deep Shaft Activated Sludge Process,
W81-02159 5D

THAMES WATER AUTHORITY
Thames Water Authority Riverside Waste Water Treatment Works - Trade Effluent Treatment Plant Operating Problems and Their Resolution,
W81-02167 5D

Sludge Disposal Practices in Thames Water Authority,
W81-02171 5E

THERMAL SPRINGS
Geothermal Resources in the Banbury Hot Springs Area, Twin Falls County, Idaho,
W81-02367 1A

TIDAL EFFECTS
Preliminary Simulated Tidal Flow and Circulation Patterns in Hillsborough Bay, Florida,
W81-02363 2L

TIME SERIES ANALYSIS
A Sequencing Sediment Trap for Time-Series Studies of Fragile Particles,
W81-02244 5A

An Exploratory Application of Entropy Minimax to Weather Prediction: Estimating the Likelihood of Multi-Year Droughts in California,
W81-02264 6A

TOXICITY
Studies on the Toxicity of Pulp and Paper Mill Effluents - II. Mutagenicity of the Extracts of the Liver from Spotted Sea Trout (Nibea Mitsukurii),
W81-02183 5A

A Bioassay Application for Quantitative Toxicity Measurements, Using the Green Algae Selenastrum Capricornutum,
W81-02194 5A

Estimated Safe Zinc and Copper Levels for Chinook Salmon, Oncorhynchus Tshawytscha, in the Upper Sacramento River, California,
W81-02225 5C

Effect of 20- to 30-Day Continuous Exposure of Treated Bleached Kraft Mill Effluent on Selected Freshwater Species,
W81-02232 5C

TOXINS
Control of Toxics in the United States,
W81-02315 5G

TRACE ELEMENTS
Use of an In Situ Artificial Substrate for Biological Accumulation and Monitoring of Aqueous Trace Metals--A Preliminary Field Investigation,
W81-02192 5A

Summary of Water-Quality Data For Selected Streams in Colorado,
W81-02394 7C

TRANSMISSIVITY
Aquifer Tests in the Gallup Sandstone Near Yah-Ta-Hey, New Mexico,
W81-02397 2F

TREATMENT FACILITES
Flexible System Saves Energy,
W81-02189 5D

TREATMENT FACILITIES
Experience in Operating the Deep Shaft Activated Sludge Process,
W81-02159 5D

Intensified Biological Waste Water Treatment City of Frankfurt AM Main,
W81-02162 5D

Periodic Parameter Variation in a Full Scale Treatment Plant with Alternating Operation,
W81-02164 5D

Odors and Their Control in Sewers and Treatment Facilities,
W81-02166 5D

Thames Water Authority Riverside Waste Water Treatment Works - Trade Effluent Treatment Plant Operating Problems and Their Resolution,
W81-02167 5D

Winning Design Satisfies Diverse Needs,
W81-02188 5D

Treatment of Combined Domestic and Industrial Waste Water in Garland, Texas,
W81-02204 5D

Playground and WTP are Good Neighbors,
W81-02261 5F

TREATMENT FACILITY
Component Mix Meets Tough Standards,
W81-02187 5D

TRINITY RIVER BASIN
Proposed Trinity River Basin Fish and Wildlife Management Program, Summary Report, Final.
W81-02328 6G

Proposed Trinity River Basin Fish and Wildlife Management Program, Main Report, Final.
W81-02329 6G

Proposed Trinity River Basin Fish and Wildlife Management Program, Appendix A, Socioeconomic Analysis, Final.
W81-02330 6G

Proposed Trinity River Basin Fish and Wildlife Management Program, Appendix B, Sediment and Related Analysis, Final.
W81-02331 6G

Proposed Trinity River Basin Fish and Wildlife Management Program, Appendix C, Fish and Wildlife Analysis, Final, Volume 1.
W81-02332 6G

Proposed Trinity River Basin Fish and Wildlife Mangement Program, Appendix C, Fish and Wildlife Analysis, Final, Volume 2.
W81-02333 6G

Proposed Trinity River Basin Fish and Wildlife Management Program, Appendix D, Draft Report Comments and Responses, Final, Volume 1.
W81-02334 6G

Proposed Trinity River Basin Fish and Wildlife Management Program, Appendix D, Draft Report Comments and Responses, Final, Volume 2.
W81-02335 6G

TROUT
Studies on the Toxicity of Pulp and Paper Mill Effluents - II. Mutagenicity of the Extracts of the Liver from Spotted Sea Trout (Nibea Mitsukurii),
W81-02183 5A

TURBIDITY
Ecological Studies of the Kelp, Laminaria Hyperborea, and its Associated Fauna in Southwest Ireland,
W81-02215 2L

Relationship Between Nephelometric Turbidity and Scattering Coefficients in Certain Australian Waters,
W81-02236 5A

TWIN CITIES METROPOLITAN AREA (MN)
Quality of Runoff from Small Watersheds in the Twin Cities Metropolitan Area, Minnesota--A Project Plan,
W81-02354 5B

U.S. GEOLOGICAL SURVEY
Identification Codes for Organizations Listed in Computerized Data Systems of the U.S. Geological Survey,
W81-02344 10D

ULTIMATE DISPOSAL
Trace Organic Behavior in Soil Columns during Rapid Infiltration of Secondary Waste water,
W81-02190 5D

UNITED KINGDOM
Operating Experiences with Dissolved Air Flotation on Various Raw Waters,
W81-02251 5F

UNITED NATIONS
The United Nations International Drinking Water Supply and Sanitation Decade,
W81-02250 6E

UNSTEADY FLOW
Dynamic-Wave Modeling of Storm Sewers with Surcharge,
W81-02270 8B

URANIUM
Behavior of Radium and Barium in a System Including Uranium Mine Waste Waters and Adjacent Surface Waters,
W81-02200 5B

Determination of Uranium by Thermal and Epithermal Neutron Activation in Natural Waters and in Human Urine,
W81-02249 5A

URBAN HYDROLOGY
Quality of Runoff from Small Watersheds in the Twin Cities Metropolitan Area, Minnesota--A Project Plan,
W81-02354 5B

Hydrologic Data for Urban Studies in the San Antonio, Texas Metropolitan Area, 1977,
W81-02390 4C

URBAN RUNOFF
Evaluation of Urban Stormwater Quality and Nonstructural Best Management Practices,
W81-02289 5B

New Methodologies to Evaluate Best Management Practices,
W81-02296 6A

Cost-Effectiveness Factors for Urban Best Management Practices,
W81-02299 6A

Balancing Public and Private Controls at the Suburban County Level,
W81-02304 4D

Technique for Estimating the Magnitude and Frequency of Floods in the Houston, Texas, Metropolitan Area,
W81-02347 6F

URBAN RUNOFF

Hydrologic Data for Urban Studies in the San Antonio, Texas Metropolitan Area, 1977.
W81-02390 4C

URBANIZATION
A Local Urban Perspective on Nonpoint Pollution Control.
W81-02282 5G

Technique for Estimating the Magnitude and Frequency of Floods in the Houston, Texas, Metropolitan Area.
W81-02347 6F

UTAH
Biology of the North Arm,
W81-02309 5C

Water Budget and Water-Surface Fluctuations, Great Salt Lake, Utah.
W81-02361 2H

VALLEY COUNTY (MT)
Limnological Data for 12 Reservoirs in Valley County, Montana,
W81-02351 2H

VANDENBERG AIR FORCE BASE (CA)
Groundwater Data, 1969-77, Vandenberg Air Force Base Area, Santa Barbara County, California.
W81-02359 7C

VERMONT
Modeling Dairy Farm Operator Response to Nonpoint Source Control Regulations,
W81-02291 5B

VERTICAL MIGRATION
Vertical Migrations of Zooplankton in the Arctic: A Test of the Environmental Controls.
W81-02312 2H

VIRGINIA
Nonpoint Sources and Impacts in a Small Coastal Plain Estuary: A Case Study of the Ware River Basin, Virginia.
W81-02286 5B

Pollutant Export from Small Catchments Exhibiting Different Agricultural Uses and Management Practices,
W81-02298 5B

Cost-Effectiveness Factors for Urban Best Management Practices,
W81-02299 6A

Benefit Taxation and Cost Sharing: Mechanisms for Encourgaging Acceptance of Nonpoint Pollution Control Strategies,
W81-02307 6C

The Statewide 208 Nonpoint Source Control Program for Virginia,
